SUBJECT: Toftdahl Drum Site - Routine Monitoring Round IV

SUMMARY

The Toxics, Compliance, and Ground Water Investigations Section collected samples from four domestic water supply wells located in the area surrounding the former Toftdahl Drum Site on April 23, 1991. This sampling was part of the routine ground water monitoring conducted at the site since 1987. Low concentrations of lead, copper, and zinc were detected in the domestic wells. These concentrations were all well below state and federal drinking water standards and state ground water quality standards. Observed concentrations are consistent with previous sampling results; copper and zinc are the only analytes that are regularly detected in the private wells. These occurrences are probably related to well construction and plumbing materials.

OBJECTIVES

The Toxics, Compliance, and Ground Water Investigations Section was requested by the Toxics Cleanup Program (TCP) to monitor ground water at the Toftdahl Drum Site on a semi-annual basis as required by the federally mandated Record of Decision (ROD). Monitoring objectives are as follows:

1. Provide routine ground water monitoring data semi-annually for five years, ending in April 1991, then annually for ten years. (Annual sampling for priority pollutant metals was completed in October 1990. Annual sampling for all priority pollutants was completed in April 1991.)
2. Sample for all priority pollutants semi-annually to provide TCP with data that would possibly explain past sporadic detection of polyaromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs), and semi-volatile organic compounds (BNAs); and
3. Determine future sampling needs at the completion of the semi-annual sampling.

SITE BACKGROUND

In the early 1970s, drums containing unknown quantities and types of waste were cleaned for resale on the Toftdahl property. The drums allegedly contained industrial wastes from a plywood manufacturing facility. It is estimated that between 100 and 200 drums were cleaned on the site. Approximately 50 drums contained residual wastes and could not be sold. These drums were buried on-site (see Figure 1). In 1985, the buried drums and wastes were removed. A Remedial Investigation conducted after drum removal concluded that no significant soil or ground water contamination existed. Low concentrations of PAHs, PCBs, VOCs, and BNAs were detected sporadically in nearby domestic water-supply wells. The ROD for the Toftdahl site requires ground water monitoring semi-annually for five years, then annually for ten years. In 1989, the site was delisted from the National Priorities List.

Geology of the area was defined in the Final Remedial Investigation (1986) as consisting of a complex sequence of discontinuous sediments, sedimentary rocks, and volcanic layers. Extensive weathering and/or hydrothermal alteration of the original rock units and deposits makes stratigraphic correlation uncertain. Generally, ground water occurs in coarser stratified sand, gravel and clayey gravel zones at various depths. Based on on-site well logs, two aquifer systems have been identified beneath the site, designated the shallow and deep aquifers. Both systems consist of several discontinuous water-bearing zones separated by layers of clay and silt. The shallow system ranges in depth from about 7 to 30 feet and the deep system ranges in depth from 69 to 98 feet. Water levels in some deep borings are within 50 feet of the ground surface indicating at least partially confining conditions. The four private wells sampled during the compliance monitoring are all drilled to the deep zone, and range in depth from 72 to 110 feet. Ground water in the deep system is generally thought to flow to the south. The Boone well is considered to be upgradient of the site and the Bedoff, Homala, and Kyle wells downgradient. Figure 2 shows the locations of the domestic wells sampled and the approximate ground water flow direction.

METHODS

Ground Water Sampling

Prior to sample collection, domestic wells were purged by allowing taps to run until pH, temperature, and specific conductance measurements stabilized. Samples were then collected from the tap nearest the well. Wells were sampled from upgradient to downgradient. All wells were sampled for volatile and semi-volatile organics, polychlorinated biphenyls (PCBs), pesticides, cyanide, and total priority pollutant metals. Volatile organic samples were preserved with two drops of 1:1 hydrochloric acid, and metal samples were preserved with 1 mL of nitric acid to a pH<2. Chemical analyses, analytical methods, and detection limits are shown in Table 1.

Quality Assurance Samples

In addition to laboratory calibration standards and method blanks, field quality assurance samples consisted of a blind duplicate and a transport blank. A blind duplicate sample, labeled "Smith", was collected from the Kyle well. Duplicate samples are two sets of samples collected from a well at the same time and submitted to the laboratory with different identification.

Laboratory quality assurance results were evaluated by Stuart Magoon and Randy Knox of the Manchester Laboratory, and are included in Appendix A. In general, the quality of the results are good. Acetone was detected at or near the detection limit in the Boone (4 ppb), Bedoff (4 ppb), and Kyle (2 ppb) wells and is qualified with a "J" indicating an estimated concentration. Although the procedural blanks associated with these samples showed no detectable levels of acetone, acetone is a common laboratory contaminant. Mercury was detected in the transport blank at 0.50 µg/L. All spike recoveries were within acceptable limits of 75-125%. Relative percent difference (%RPD) for a spike and spike duplicate were within $\pm 20\%$. The relative percent difference of the blind duplicate samples (Kyle and Smith) were within $\pm 20\%$ for duplicate analysis.

ANALYTICAL RESULTS

Analytical results are presented in Appendix A. Data were managed using the ENVIS database software package. Table 2 is a summary of field parameters and test results for sample Round IV conducted on April 23, 1991. Of the organic analytes tested for (volatile and semi-volatile compounds, cyanide, pesticides, and polychlorinated biphenyls) acetone was the only analyte detected at or near the detection limit in three of the four wells sampled and were qualified as estimates. Copper and zinc were detected at low concentrations in both the up- and downgradient wells. Lead was also detected in the Boone well (upgradient) and the Kyle well, but concentrations were near the detection limit and were qualified as estimates.

DISCUSSION AND CONCLUSIONS

As shown in Table 3, all detected concentrations for this round of sampling were well below the maximum contaminant levels (MCLs) established for state and federal drinking water supplies. Table 3 also summarizes results for all sample rounds to date.

Results from routine monitoring for 1987 to the present supports the Remedial Investigation (RI) findings that the degree of contamination at the site is probably small and does not appear to be a threat to public health or the environment via the ground water. Copper and zinc are the only analytes that are consistently detected in the wells, and concentrations are consistently higher in the upgradient Boone well than in the downgradient wells. These occurrences are probably related to well construction and plumbing materials. The presence of acetone at low concentrations during this round of sampling is probably related to laboratory contamination but

*: Primary Maximum Contaminant Levels (MCLs) are based on chronic and acute health effects.

**: Secondary Maximum Contaminant Levels (MCLs) are based on factors other than health effect.

should be verified in subsequent sampling events. Other organic contaminants such as volatile and semi-volatile compounds, cyanide, pesticides, and PCBs, which occurred sporadically at very low concentrations during the initial phases of the site investigation have not been detected since the first routine sample round in 1987.

RECOMMENDATIONS

1. Based on past analytical results and the Record of Decision (ROD), routine monitoring should continue annually for the next 10 years. Due to the presence of acetone in Sample Round IV, volatile organics should be analyzed for at least the next two years. Selected metals (chromium, copper, lead and zinc) should be tested for the next ten years.
2. Three downgradient wells (Bedoff, Homala, and Kyle) and one upgradient well (Boone) should continue to be sampled.
3. At the completion of the ten year monitoring period, if no contaminants are observed other than copper and zinc, long-term monitoring should be discontinued.

May 30, 1991

TO: Pamela Marti
FROM: Randy Knox *RK*
SUBJECT: QA Summary on Metals Data

SAMPLE RECEIPT:

The samples from the Toftdahl Drum Site project were received by the Manchester Laboratory on 24/04/91 in good condition.

HOLDING TIMES:

All analyses were performed within the specified holding times for metals analysis (28 days for mercury, 180 days for all other metals).

INSTRUMENT CALIBRATION:

Instrument calibration was performed before each analytical run and checked by initial calibration verification standards and blanks. Continuing calibration standards and blanks were analyzed at a frequency of 10% during the run and again at the end of the analytical run. All initial and continuing calibration verification standards were within the control limits of +/- 10%. AA calibration gave correlation coefficients greater than the criteria of 0.995. A correlation coefficient of 0.995 or higher means that the calibration is acceptable.

PROCEDURAL BLANKS:

The procedural blanks associated with these samples showed no detectable levels of analytes.

SPIKED SAMPLE ANALYSIS:

Spiked sample and duplicate spiked sample analysis were performed on sample number(s) 178071. All spike recoveries were within the acceptable limits of +/- 25% for water sample analysis.

PRECISION DATA:

The duplicate results of the spiked and duplicate spiked sample were used to calculate precision related to the analysis of these

samples. The % RPD for all parameters was within the +/- 20% window for duplicate analysis. Most differences were small with the exception of chromium which was 19.6% and nickel which was 18.5 %. There is no need to qualify the data.

ICP SERIAL DILUTION ANALYSIS:

The levels of analytes were low enough that serial dilution was not appropriate.

SUMMARY:

The data generated by the analysis of the above referenced samples can be used without qualification.

If you have any questions about the results or the methods used to obtain these results please call me at SCAN 744-4737.

Case Summary

These analyses were reviewed for qualitative and quantitative accuracy, validity, and usefulness.

There is no need to assimilate the "dilution factor" or "sample wt/vol" into the final values reported; these calculations have already been figured into the reported values.

Note that if this data is transferred into some other format the compounds that have been tentatively identified (TIC) should have an "NJ" qualifier added to the result. The "NJ" qualifier is used to indicate that the compound has been tentatively identified and the reported value is an estimated quantity.

DATA QUALIFIER DEFINITIONS

U - The compound was not detected at or above the associated numerical value.

J - The compound was detected but the value is an estimated quantity.

UJ - The analyte was not detected at or above the reported estimated level.

NR - Not Reported. These compounds are added as part of the Matrix Spike solution.

NJ - There is evidence that the analyte is present. The associated numerical value is an estimate of the amount of this compound present.

Volatiles

Sample	Date Collect	Date Extd	Date Anlz	#Days ext anal	#Days Collect to anal
178070	4/23	NA	4/30	NA	7 of 14
178071	4/23	NA	4/30	NA	7 of 14
178072	4/23	NA	4/30	NA	7 of 14
178073	4/23	NA	4/30	NA	7 of 14
178074	4/23	NA	4/30	NA	7 of 14
178075	4/23	NA	4/30	NA	7 of 14

These samples were analyzed within the SW-846 recommended holding time.

Surrogates:

Surrogate recoveries for these samples, the matrix spikes, and the associated method blank are reasonable, acceptable and within the QC limits.

Matrix Spike/Matrix Spike Duplicate (MS/MSD):

Matrix spike/spike duplicate recovery and precision data are reasonable and acceptable, and within QC limits.

Sample Data:

This data is acceptable for use.

Semivolatiles (BNA)

Sample	Date Collect	Date Extd	Date Anlz	#Days ext anal	#Days Collect to anal
178070	4/23	4/26	5/2	3 of 7	6 of 40
178071	4/23	4/26	5/2	3 of 7	6 of 40
178072	4/23	4/26	5/2	3 of 7	6 of 40
178073	4/23	4/26	5/2	3 of 7	6 of 40
178074	4/23	4/26	5/2	3 of 7	6 of 40

These samples were extracted and analyzed within the SW-846 recommended holding time.

Surrogates:

Surrogate recoveries for these samples, the matrix spikes, and the associated method blank are reasonable, acceptable and within QC limits.

Matrix Spike/Matrix Spike Duplicate (MS/MSD):

Matrix spike/spike duplicate recovery and precision data are acceptable and within QC limits.

Sample Data:

This data is acceptable for use. Note that data qualifiers may modify the usefulness of the individual values.

Sample 178075 was inadvertently not analyzed. This sample was a Transport Blank. Fortunately samples 178070, 178071, and 178072 did not contain any detectable target analytes and can serve the same purpose as a transport blank.

Pesticides and PCB's

Sample	Date Collect	Date Extd	Date Anlz	#Days ext anal	#Days Collect to anal
178070	4/23	4/29	5/4	6 of 7	5 of 40
178071	4/23	4/29	5/4	6 of 7	5 of 40
178072	4/23	4/29	5/4	6 of 7	5 of 40
178073	4/23	4/29	5/4	6 of 7	5 of 40
178074	4/23	4/29	5/4	6 of 7	5 of 40

These samples were extracted and analyzed within the SW-846 recommended holding time.

Surrogates:

Surrogate recoveries for these samples, the matrix spikes, and the associated method blank are reasonable, acceptable and within QC limits.

Matrix Spike/Matrix Spike Duplicate (MS/MSD):

Matrix spike/spike duplicate recovery and precision data are acceptable and within QC limits.

Sample Data:

This data is acceptable for use. Note that data qualifiers may modify the usefulness of the individual values.

Sample 178075 was inadvertently not analyzed. This sample was a Transport Blank. Fortunately none of the samples analyzed contained any detectable target analytes.

LAUCKS TESTING LABORATORIES
940 S. Harney
Seattle, WA 98108

TO: Washington State Department of Ecology
Project Name: Toftdahl Drum
Laboratory No.: 9104477
Date of this report: June 17, 1991

GENERAL REMARKS:

The following samples were analyzed under the above lab number:

Client <u>Sample</u> <u>I.D.</u>	LTL <u>Sample</u> <u>Number</u>	Analysis <u>Request</u>
178070	9104477-01	VOA/ABN/PEST/PCB
178071	9104477-02	VOA/ABN/PEST/PCB
178072	9104477-03	VOA/ABN/PEST/PC3
178073	9104477-04	VOA/ABN/PEST/PC3
178074	9104477-05	VOA/ABN/PEST/PCB
178075 TB	9104477-06	VOA

When completing forms created through the CLP software, every attempt is made to use both your sample IDs as well as the laboratory sample IDs on the forms. The forms have varied default sizes to their sample identification fields, and are not amenable to alteration or editing. When it is not possible to use your complete sample ID, because of field length limitations, Laucks will use as much of your ID as will fit, beginning from the RIGHT hand side of the sample ID number. In addition, ALL forms will contain our sample IDs, which can be cross referenced from the table above.

Many of the CLP-package forms will include the words "EPA Sample No.," or some variation of this, which again cannot be edited. Where a reference is made to the EPA, you may take this to mean more generally, "the client". These data are not part of an actual EPA case.

GENERAL REMARKS ON ORGANIC ANALYSES:

GC/MS Fractions:

Compounds may be called out as hits on the computerized printout. However, if they are not reported on the OADS (sample results) form, the mass spectral data have been manually searched and the compounds have been eliminated as hits based on this search.

LAUCKS TESTING LABORATORIES
940 S. Harney
Seattle, WA 98108

ABN Fraction:

The data system which is used to perform the searches for ABN Tentatively Identified Compounds (TICs) is set with a threshold of 5% fit for TICs. In some cases less than three compounds in the NBS library pass this threshold setting. When this occurs there will not be spectra and fits for the associated unknown compound. This will be called out on the first page of the data system report and will be reflected in the spectra which are drawn; i.e., there will be less than three best-fit spectra. This generally has one of two meanings. First, that there are no compounds passing the fit criteria; or, second, that one or more compounds pass the fit criteria. It is our opinion that the threshold setting for fit is set low enough that all reasonable and possible hits will be reported (up to a maximum of three).

Two optional ABN surrogates are used for recovery purposes, recoveries for one of which (2-Bromophenol) are listed under "Other" on Form II. The second optional surrogate is d10-Azobenzene. The recoveries for samples in this set are as listed:

Sample	% Recovery
SBLKL1	69
178070	70
178070MS	70
178070MSD	72
178071	70
178072	67
178073	74
178074	69

Volatile Fraction:

All volatile analyses were performed using a DB-624 megabore capillary. The elution order and retention times differ from those stated for packed column analysis in the U.S.E.P.A.'s Statement of Work for organic CLP analyses. Listed below are the correct elution order and the internal standard with which each compound is associated.

Bromochloromethane (IS)	1,4-Difluorobenzene (IS)	d5-Chlorobenzene (IS)
Chloromethane	Benzene	4-Methyl-2-Pentanone
Vinyl Chloride	Trichloroethylene	Toluene
Bromomethane	1,2-Dichloropropane	d8-Toluene (SURR)

LAUCKS TESTING LABORATORIES
940 S. Harney
Seattle, WA 98108

ABN Fraction:

The acid and base-neutral fractions of all samples in this case were combined prior to the solvent reduction step, so that final extract volume for all samples was 1.0 ml, rather than the default 2.0 mls. Thus, CRQLS reported for all samples are lower by a factor of two.

Pesticide/PCB Fraction:

Initial Linearity Verification Standards:

All of the compounds were above the 15% RSD control limit in the confirmation column.

Continuing Calibration Verification Standards:

In the first and second CCV of the quantitation column several of the analytes and the surrogates DBC and OCB had a percent deviation above the 15% control limit.

In the first CCV of the confirmation run all of the analytes and surrogates exceeded the 20% deviation control limit. In the second CCV of the confirmation column all of the analytes and the surrogates DBC, DCB, and Isodrin were above the 20% deviation control limit.

It is noted that there is considerable variance in the CCV standards. Because these standards exceeded the upper control limit and there was no detection of pesticides or PCBs in any of the samples, no further action was required.

Pesticide Breakdown Evaluation:

In the quantitation column the total breakdown exceeded the 15% control limit in all three of the EVAL B standards. The first and third EVAL B standards were above the 20% control limit in the confirmation run.

Sample Results:

No pesticides or PCBs were detected in any of the samples. All surrogate recoveries as well as MS/MSD results were in control.

LAUCKS TESTING LABORATORIES
940 S. Harney
Seattle, WA 98108

Chloroethane	Bromodichloromethane	Trans-1,3-Dichloropropene
1,1-Dichloroethylene	Cis-1,3-Dichloropropene	1,1,2-Trichloroethane
Acetone		Tetrachloroethylene
Carbon Disulfide		2-Hexanone
Methylene Chloride		Dibromochloromethane
Trans-1,2-Dichloroethylene		Chlorobenzene
1,1-Dichloroethane		Ethylbenzene
Vinyl Acetate		Styrene
Cis-1,2-Dichloroethylene		M,P-Xylene
2-Butanone		O-xylene
Chloroform		Bromoform
1,1,1-Trichloroethane		1,1,2,2-Tetrachloroethane
Carbon Tetrachloride		Bromofluorobenzene(SURR)
1,2-Dichloroethane		
d4-1,2-Dichloroethane(SURR)		

The analytes listed above were assigned to their respective internal standards on the basis of relative retention time (RRT). For all compounds except cis-1,3-dichloropropene, the RRTs fall between 0.8 and 1.2. Cis-1,2-dichloropropene was the only compound to fall outside of this range, and was assigned to the internal standard closest to its retention time.

Separation of cis- and trans- dichloroethylene isomers is achievable on a DB-624 megabore capillary column. These compounds have been found to coelute on the packed column specified in the U.S.E.P.A.'s Statement of Work. When these isomers are found in a sample, they will be reported as total-1,2-dichloroethylene.

A holding blank was analyzed in the same QC period with the samples from this set. The raw data were not submitted with the case. It will be held on file at Laucks should future review be necessary.

Pesticide/PCB Fraction:

The compound isodrin was added as a second, optional surrogate in the pesticide/PCB analyses. Recovery values are reported on the appropriate FORM II - PEST.

SPECIFIC REMARKS ON ORGANIC ANALYSES:

VOA Fraction:

No comments.
