

A Department of Ecology Report

Lakewood/Plaza Cleaners

January 17-18, 1996

Introduction

This document is one in a series describing the results of ground water sampling at Lakewood/Plaza Cleaners. The sampling program was designed by U.S. Environmental Protection Agency's contractor, CH2M Hill, as part of the Lakewood Remedial Action (CH2M Hill 1990a, b). Ecology has conducted the semi-annual ground water sampling at the site since 1991. The objective of this sampling is to collect ground water quality data for the Toxics Cleanup Program to evaluate the effectiveness of Lakewood supply wells H1 and H2 (Figure 1) to contain and remove contaminated ground water caused by Plaza Cleaners. Samples were collected on January 17-18, 1996 from one municipal well (H1) and eight monitoring wells: MW-16A, MW-20A, MW-20B, MW-27, MW-28A, MW-31, MW-32, and MW-41 (Figure 1). All samples were analyzed for volatile organics (VOAs). The quality assurance review and laboratory reporting sheets are presented in Appendix A.

Results

Field Observations

Table 1 lists field observation data for each of the sampled wells: static water level, pH, specific conductance, temperature, purged volume, well depth, and the geologic unit. Well MW-20A had a pH reading of 8.3 standard units, which is consistent with previous measurements. The high pH readings in MW-20A are most likely related to well construction. This is most likely caused by bentonite inadvertently being placed within the screened interval during well construction. The specific conductance in well MW-20B (395 umhos/cm), which is screened in a fine-grained till unit, was two times greater than the other wells. Specific conductance readings are typically higher for water from fine-grained units.

Laboratory Results

Table 2 summarizes laboratory results. The highest concentrations of tetrachloroethene (PERC), trichloroethene (TCE), and cis-1,2-dichloroethene (cis-1,2-DCE) occurred in well MW-20B with 353 ppb, 7.2 ppb, and 15 ppb, respectively. PERC and TCE were also detected in MW-16A and municipal well H1. PERC concentrations were 47 ppb and 8.4 ppb, respectively. TCE was detected below the practical quantitation limit of 1 ppb. PERC and/or cis-1,2-DCE were detected in wells H1, MW-16A, MW-20A, MW-31, and MW-32 at concentrations near the quantitation limit of 1 ppb. Trans-1,2-dichloroethene was detected in MW-20B below the quantitation limit.

Table 3 shows PERC, TCE, and cis-1,2-DCE concentrations for January 1991 through January 1996. PERC and cis-1,2-DCE continue to be detected at or near the detection limit in most of the wells screened in the Advance Outwash (refer to Figure 1 for typical site stratigraphy). Well MW-20B, which is screened in the Vashon Till, continues to have the highest concentrations.

Figure 2 shows PERC concentrations at wells MW-20B and MW-16A between 1984 and 1996. Since 1984, PERC concentrations in both wells have varied substantially. PERC concentrations decreased initially in MW-20B from March 1985 (4800 ppb) to May 1985 (570 ppb). After May 1985, concentrations ranged between 86 ppb and 1200 ppb. Over the monitoring period PERC concentrations in MW-16A have varied between 3 ppb and 110 ppb.

Methods

Ground Water Sampling

Samples were collected on January 17-18, 1996 from one municipal well H1 and eight monitoring wells: MW-16A, MW-20A, MW-20B, MW-27, MW-28A, MW-31, MW-32, and MW-41 (Figure 1). Prior to sample collection, static water level measurements were obtained using an electronic water level indicator. The meter was rinsed with deionized water after each use. All monitoring wells were purged a minimum of three well volumes and until pH, temperature, and specific conductance readings stabilized. Purge water was discharged to storm drains or to the ground near each well. All monitoring wells were purged and sampled using dedicated bladder pumps, except for MW-20B. Well MW-20B was purged and sampled with a decontaminated teflon bailer. Municipal well H1 was sampled from a tap nearest to the well. Samples collected for volatile organics were free of headspace and preserved with two drops of 1:1 hydrochloric acid.

The bailer was pre-cleaned with a Liquinox® wash and sequential rinses of hot tap water, 10% nitric acid, distilled/deionized water, and pesticide-grade acetone. After cleaning, the

bailer was air-dried and wrapped in aluminum foil. Chain-of-custody procedures were followed in accordance with Manchester Laboratory protocol (Ecology, 1994).

Quality Assurance Samples

Quality control samples collected in the field for the ground water monitoring consisted of a blind duplicate and a replicate sample. A blind duplicate sample was collected from well MW-16A. Duplicate samples are two sets of samples collected from a well simultaneously and submitted to the laboratory with different identification. A replicate sample was collected from well MW-20A. Replicate samples are two sets of samples collected from a well at different times. In addition to quality control samples collected in the field, laboratory quality control samples consisted of matrix spikes, matrix spike duplicates and surrogate compound recoveries. Volatile organic samples were analyzed using EPA SW-846 Method 8260 (U.S. EPA, 1986).

In general the quality of the data is acceptable for use. Volatile organic analyses were performed by the Manchester Laboratory. Greg Perez of the Manchester Laboratory conducted the quality assurance review. PERC values for samples from well MW-16A are qualified as estimates because they slightly exceeded the upper calibration limit.

Duplicate samples collected at MW-16A provide an estimate of combined sampling and laboratory precision. The numeric comparison of duplicate results is expressed as the relative percent difference or RPD. RPDs are the ratio of the difference and the mean of the duplicate results expressed as a percentage. The RPDs for tetrachloroethene, trichloroethene and cis-1,2-dichloroethene were 2%, 6%, and 0%, respectively. Matrix spike and spike duplicate target compounds not within acceptable QC limits were rejected since they were not considered to be of primary interest for this project. All other matrix spike and spike duplicate recoveries are within the QC limits of "25% for water sample analysis.

Organics Analysis Unit

VOLATILE ORGANIC ANALYSIS

SUMMARY:

The values for tetrachloroethylene in samples 038089 and 090 were qualified as estimates because they exceeded the upper limit of the initial calibration. Normally the initial calibration extends to 80 ug/L. In this case, because of an error in the making of that standard this initial calibration only extended to 40 ug/l. These two samples were just above that level.

There is enough historical data to demonstrate linearity at the concentrations found in these samples and provide confidence in the results. Technical guidelines required qualification.

The value for tetrachloroethylene for sample 038087 should be taken from the dilution.

ANALYTICAL METHODS:

Volatile organic compounds were analyzed using Manchester modification of the EPA Method 8260 purge-trap procedure with capillary GC/MS analysis. Normal QA/QC procedures were performed on the samples.

BLANKS:

Low levels of certain target compounds were detected in the laboratory blanks. If the concentrations of the compounds in the sample are greater than or equal to five times the concentrations of the compounds in the associated method blank, they are considered native to the sample.

SURROGATES:

Surrogate recoveries were within acceptable limits for the water samples..

HOLDING TIMES:

The water samples were analyzed within the recommended 14 day holding time.

MATRIX SPIKE AND MATRIX SPIKE DUPLICATE:

Any target compounds not within acceptable QC limits for both percent recovery and relative percent differences (RPD) have been rejected on the sample associated with the matrix spikes. The compounds affected were not considered to be of primary interest in this project.

DATA QUALIFIER CODES:

- U - The analyte was not detected at or above the reported value.
- J - The analyte was positively identified. The associated numerical value is an estimate.
- UJ - The analyte was not detected at or above the reported estimated result.
- REJ - The data are unusable for all purposes.
- NAF - Not analyzed for.
- N - For organic analytes there is evidence the analyte is present in this sample.
- NJ - There is evidence that the analyte is present. The associated numerical result is an estimate.
- E - This qualifier is used when the concentration of the associated value exceeds the known calibration range.
- bold** - The analyte was present in the sample. (Visual Aid to locate detected compound on report sheet.)
