Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Kelly Jensvold

The Kalama Methanol Refinery must not be built.

Creating any new fossil fuel project is a bad idea. To say that creating the world's largest methanol refinery on the Columbia River is a terrible and dangerous idea is a gross understatement.

NW Innovation Works has been causing deception:

First of all, new fossil fuel infrastructures aren't innovative and NWIW is not from the Northwest, it's a Chinese company.

The Sightlight Institute says the project backers have been contradicting themselves whether the final product would be used for fuel or plastics. (Neither are environmentally conscious or innovative or a worthy investments considering the consequences locally and globally.)

Despite mainstream green-washing, methane/natural gas isn't clean, it's just another fossil fuel. In fact, Methane is a super pollutant. The IPCC recently reported that methane may be as much as 86x more potent at climate disruption than carbon dioxide in the first 20 years in the atmosphere.

Backers of the project say the project will reduce emissions. When the whole supply chain is considered, from drill site to consumption half across the world, it's clear this project won't reduce emission, it will result in a substantial increase.

Backers say that tax payers won't receive the bill. That's false too.

Lastly, one shouldn't believe everything pro-fossil fuel parties and profiteers of fossil fuel projects say about fossil fuel projects being environmentally beneficial or in the public's interest.

You must listen to those who are motivated to support the greater good, not those that are in it for themselves. Don't fall for NW Innovation Work's green-washing or trickery.

Moving forward on any new fossil fuel project is the wrong decision, especially this one.

This project is no different than any other past fossil fuel project proposal that has died in the Pacific Northwest.

This project must not move forward.

Virginia Davis

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Martin Adams

Please deny this project your approval. None of the uses of methanol should be encouraged. "Some may be used as fuel". Fuel should be biofuel, not methane based.

We recently banned plastic bags and learned recently that plastics are not recycled as much as purported. Most can be made from corn oil.

Please encourage leaving the gas and oil in the ground by denying this development.

Kenneth Zirinsky

Re: Kalama Manufacturing and Marine Export Facility Second Supplemental EIS (SSEIS)

I am a retired physician and I live in Tacoma, WA. I would like to address the potential effects of the chemicals utilized and produced by the Kalama manufacturing facility on the health of the local community and urge you to deny the proposal to build and operate the methanol manufacturing facility by rejecting the Shoreline Conditional Use Permit.

Please note that I was unable to find text in any section of the SSEIS that addressed the direct health effects (toxicity) of methanol and other organic chemicals naturally present in the natural gas used to produce methanol.

Toxic effects of methanol include blindness, seizures, and kidney failure. (1,2)

Once in the body, methanol is metabolized into formaldehyde. (3)

The toxic effects of formaldehyde include cancer of the nasal passages and lung cancer. (4)

Benzene is a natural constituent of natural gas (5) and natural gas will be utilized to produce methanol at the Kalama manufacturing facility.

Long-term exposure to benzene can cause blood cancers such as leukemia. (6)

In summary, I urge you to consider the toxic effects of acute accidental and chronic long-term low level exposure to methanol and natural gas and to deny the proposal to build and operate the Kalama methanol manufacturing facility by rejecting the Shoreline Conditional Use Permit.

Mandy Lill

My name is Mandy Lill. I am a proud resident of Kalama who lives a mile away from the proposed site, and I support the NWIW Methanol facility 100%. Here are some of the many reasons I support this project:

- **Jobs.** The construction of the facility will provide 1,000 jobs to local workers. While these jobs may be temporary, they will bring a much needed boost to the area and give these construction workers a couple years' worth of work. When the plant opens up, it will provide 200 permanent family wage jobs. I hear people argue that these jobs will not be given to locals and I would like to know where they are getting that information from? I think it is an insult to our community that the nay-sayers think we don't have anyone qualified. The jobs provided will not just be engineering or operator positions (of which there are a multitude of people in our county that can fill that need). What about the administrative positions they will need to fill? Accountants, administrative assistants, marketing, IT, human resources, office managers. Then there are the indirect jobs this will create. Will someone get to fulfill their dream of starting a deli to help feed these workers on their lunch breaks? How about your neighbor who just graduated with a business degree and wants to start her own coffee shop in close proximity to the plant so the workers have easy access to a cup-of-joe. Maybe a new employee of the plant, who was previously unemployed, will now need childcare. This is just a tiny sample of the jobs that will help give strength to our wonderful community.
- **Zero liquid discharge in our river.** NWIW has committed to eliminating all water discharge into the Columbia River.
- **Local partnerships.** NWIW and Lower Columbia College have partnered together to create a program that will train 40 local people to work at the methanol facility. 20 of those people will be local high school graduates. The other 20 people will be people with disabilities, veterans, people who are unemployed, and others who are facing some sort of barriers in the work force.
- **It provides something we need.** Methanol is in so many things we all use every day. It was used to make your carpet, siding, flooring, furniture, pet products, flat irons, the containers your makeup comes in, your computers & cell phones, kayaks, windshield wiper fluid, reusable water bottles, clothing, those paddles at the hospital that may save your life someday. If I listed everything, my letter would be endless.
- **Taxes.** This plant will bring a HUGE tax boost to our area. If it was already built, our new schools would be paid for and not with a new tax on the residents. It will also provide much needed funding to our fire department.

People continue to ask why we can't do some other kind of project that is "green" for the environment. One example widely used is wind energy. Wind energy is great idea and we should continue to embrace it. I'm not sure that people realize it takes methanol to create those wind blades. Also wind blades do not last forever, they have a life span of 20 years but many are removed after just 10 so they can be replaced with larger and stronger designs. When it comes time to replace them the old blades are not recyclable, therefore they are filling up landfills at an unprecedented rate. There is a landfill in Casper Wyoming that is home to 870 old blades. 8,000 blades will be removed in each of the next 4 years in the United States. According to NPR, over 720,000 tons of blade material will be disposed of over the next 20 years in the U.S. Do you want these buried in your backyard?

Methanol is simply supply and demand. Consumers demand products that are made with methanol. As long as we continue to use these products, we will need methanol. Let's build this plant in the most environmentally rigorous area of the U.S. where we know it will be built properly, will be the most efficient, and where our community will enjoy the financial benefits.

Thank you, Mandy Lill

Tika Bordelon

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Dr. Tika Bordelon

tikabl@gmail.com

Jennifer Brodie

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

I am concerned about the justification for this plant being that it is less awful than other fracking operations. To me it seems that it is time to turn to other ways of producing energy and jobs.

Would you want to eat something just a little moldy rather than totally off?

Wouldn't it be better to have a fresh food.

I concur with the opinions expressed below.

Jennifer Brodie

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Washington Department of Ecology
(submitted via on-line comment portal)

RE: Kalama Manufacturing and Marine Export Facility -- Supplemental Comments

Dear Ecology:

I oppose the permit application of NWIW for the KMMEF. You should deny the application. These comments supplement my comments submitted earlier.

As I previously stated, I am an ordinary citizen with two children and two grandchildren and I am very concerned about the future of our earth's environment for their sake. I am also concerned for the future of all other citizens of our planet.

I am submitting this additional comment because I was only recently able to obtain a copy of the Cowlitz County Superior Court's Order Affirming in Part and Reversing in Part the Shorelines Hearings Board Order Dated September 15, 2017 ("Order"), issued and filed by Judge Warning on July 12, 2018.

The Order states that "Ecology must review the SEIS and determine whether, or not, the Permits must be modified, conditioned, or denied based on the analysis in that document." (Order, p. 5, line 23.) You required the Second SEIS because you determined the FEIS and SEIS were inadequate. Essentially, that requirement was a decision that the permits should be conditioned on completion of the additional analysis you requested in the SSEIS.

It is still your obligation, therefore, to determine whether the Shoreline Conditional Use Permit and the Shoreline Substantial Development Permit you previously approved should be modified, denied or conditioned based on the SSEIS.

As noted in the SSEIS, in 2019 you recommended statewide reduction goals for GHG emission limits including reducing overall emissions of GHGs in the state to 1990 levels by 2020, by 2035 to 45% below 1990 levels, and by 2050 to 95% below 1990 levels pursuant to RCW chapter 70.235.

It is clear from the SSEIS that emissions from KMMEF will never result in any reduction in in-state GHGs for the next 40 years. At best, even assuming KMMEF is able to mitigate all of its in-state emissions, it will do nothing to meet Ecology's emissions guidelines. To the extent KMMEF does

not mitigate all emissions with in-state mitigation measures, it will make it that much harder for the state to meet its overall emission reduction targets.

As I noted previously, KMMEF promises to mitigate all its emissions, but does not identify any existing mitigation measures. Whether it can and will actually fulfill its promises is yet to be proven.

In your order requiring the SSEIS, you asked for "evidence showing how the project would impact other sources of methanol..."

Again, as I noted in my first comments, the SSEIS continues to rely on speculation about the impact of KMMEF on other sources of methanol, speculation which is internally inconsistent because of its assumptions that KMMEF methanol will replace other sources of methanol even though those sources, produced from coal, will be cheaper, and even though producers of more expensive methanol are likely to reduce their prices to be able to stay in the market. Speculation and unfounded economic projections are not "evidence".

You have given KMMEF at least 3 bites at the apple of proving its case that the permits will not harm Washington's shoreline or air-shed. It has failed each time. It continues to offer unproven and unsubstantiated projections.

Because KMMEF has not shown and cannot show it can meet the requirements of Washington's GHG emission reduction goals, it is time to deny both permits.

Washington citizens rely on the Department of Ecology to protect us and our environment from pollution, consistent with state laws. The future livability of our state and our climate depend on every jurisdiction doing its job to reduce global GHG emissions consistent with the IPCC findings.

For the sake of everybody's children and grandchildren I hope you will deny this permit.

Thank you for your consideration,

/s/

Washington Department of Ecology
Southwest Regional Office
P.O. Box 47775

October 2, 2020

RE: Second Supplemental EIS for the Kalama Manufacturing and Marine Export Facility

Dear Mr. Doenges,

Thank you for undertaking the Second Supplemental Environment Impact Statement to provide additional information about Greenhouse Gas Emissions (GHG) for the Northwest Innovation Works: Kalama Manufacturing and Marine Export Facility. Based upon this information, I am opposed to the Shoreline Conditional Use Permit for this project and recommend that the conditional use permit be denied. It is the wrong project at the wrong time.

The proposed Methanol Refinery entails the use millions of gallons of water from the Columbia River daily, pollutes the air with cancer-causing toxins, has the potential to explode during an earthquake and necessitates the expansion of the pipeline infrastructure in the State to feed the NWIW refinery. The environmental impacts of this proposed project are not limited to just Washington State and the Columbia River. The 4.6 million metric tons of carbon dioxide equivalent released annually adds significantly to the greenhouse gasses world-wide. Instead, we should seek to reduce those emissions and not add another manufacturing plant to the methanol industry. Worldwide, there are 90 plants with a combined production of 110 million metric tons (36.6 billion gallons or 138 billion liters of Methanol). To combat global climate change, the demand for methanol needs to decrease. This refinery, which Northwest Innovation Works claims will be the world's largest, would consume a stunning amount of fracked gas just to operate--320 million cubic feet per day, to be exact. The annualized amount of fracked gas consumed is 116,800,000,000 billion cubic ft. Along the I-5 corridor, the refinery requires a massive new pipeline down the entire length of our state. Over the decades, the citizens of Washington have strongly opposed the building of new pipelines. All of the above issues pose significant dangers to nearby communities, especially in this part of the country, which is known for earthquakes. The level of fracked gas used and the corresponding GHGs' released are profoundly inconsistent with Washington State's climate goals.

I am also quite concerned about the affects on the Columbia River resulting from the extraordinary amount of water to be removed from the Columbia. We have spent millions and millions of dollars over the last 3 decades to restore salmon populations in the River, which remains a work in progress. The citizens of Washington have clearly made a long term investment to salmon recovery. This recovery would be put at great risk, and the investment we have made would be thrown away with the added impacts of this refinery. The money invested in salmon recovery is jeopardized by the increasingly rapid climate changes. We cannot have this investment go for naught. The health of the orca whales and the Salish Sea are dependent upon the Columbia River. The world's largest methanol refinery would profoundly diminish the entire ecosystem. Additionally, the shipping traffic in this area of the Columbia would increase and further degrade the riverine ecosystem. Instead, the State of Washington needs to maintain

and enhance, if possible, the biodiversity of this ecosystem and reduce the environmental stressors current usages cause. It is my belief; we have maxed out the resilience of the Columbia River ecosystem.

The predicted demand, which underpins why this export facility is needed, assumes the continuation of current conditions. We know, however, that climate change is happening, and we know that we need coordinated action to reduce GHG in order to slow down the rate of climate change. Moreover, this project removes incentives for transitioning markets away from plastics, other fossil fuel based products and clean energy generation. Perhaps most importantly the project is inconsistent with Washington State's climate goals.

We are at a tipping point with Climate Change. The increased length of droughts, larger more intense fires, and increased number and severity of weather systems cannot be ignored. Over the last 5 years, we have experience poorer air quality as a result of large forest fires in British Columbia, Washington, Oregon and California. These fires are not one offs; they are happening annually and maybe the new normal, which is a terrifying thought. Just this last month, for example, we experienced the worst air quality along the corridor from Olympia to Seattle, with the air quality index ranging from 220 to 276. Portland had an air quality index of 500 at one point. This summer the Chelan fire further degraded the biodiversity of the East Cascades. The Oregon and California fires are the worst ever, and Seattle is expecting additional smoke to decrease air quality further. The economic impacts of climate change are immeasurable.

Northwest Innovation Works - Kalama Manufacturing and Marine Export Facility needs to be categorically denied. The environmental damage cannot be mitigated and certainly not with the vague wording currently in the environmental documents developed for this project. Washington citizens should not be bearing these risks. We are not protecting Washington's Shorelines by allowing this project to be built. In this case, "No Action" will better protect the river shoreline and is the correct choice for this project.

Thus, I urge Department of Ecology to deny the Shoreline Conditional Use permit.

Thank you for the opportunity to comment on the SSEIS.

Best Regards

Janet Thompson

LARRY JOHNSON

The recent news that China has declared a net zero footprint over the next 40 years has remarkably diminished the profit incentive for building the future Superfund site, a.k.a. the Kalama Manufacturing and Marine Export Facility.

Please reject the permit for this project.

Nancy Hausauer

Dear Director Watson and Department of Ecology:

I am writing to ask you in the strongest possible terms not to allow Northwest Innovation Works (NWIW) to build the world's largest fracked gas-to-methanol refinery in Kalama, harming our climate in general and Kalama specifically. We (Washington) should vigorously reject NWIW's proposal. They care nothing at all for our beautiful state and its citizens and are only seeking to profit for themselves at great cost to us.

NWIW misled your agency and the public about the purpose and impact of the refinery. I urge the Dept. of Ecology to dismiss NWIW's deceptive claims and accurately account for the project's upstream and downstream climate pollution.

For Kalama and for our climate in general, the risk of building this monstrosity is simply too large. Please keep our communities safe and healthy, and keep Washington on track to meet our goals for reducing climate pollution. Don't cave in and let NWIW play Washington for a fool.

I strongly urge you to do the right thing and stop this dirty, dangerous fossil fuel export project. It gives Kalama and our state nothing of real substance, but costs us greatly. It's a good deal for NWIW--but a bad deal for Washington.

Sincerely,

Nancy Hausauer
Long-time resident of Tacoma, WA

Deborah Bancroft

In section 3.4.5 Economic analysis, the report's authors posit that "more economic analysis [than what was provided in the First SEIS] was needed to adequately address stakeholder concerns" but then they shrink from doing so: "scenarios with substantially different global policies (fossilfuel/plastics phase outs or bans for example) are too uncertain to include in this analysis." We are living in a rapidly deteriorating global climate and should not be ignoring citizens' demands for clean energy sources. To do so goes against our state's legislative goals established 30 years ago.

I call upon you to serve Washingtonians by denying the CUP for this project on the grounds of the overall environmental danger to our area. Of course the project presents some "benefits" but do not be blinded by the hype. Jobs are important and it is understandable that many in the building trades are lobbying for them. Sadly, there would be many more applicants than the relatively low number of actual jobs. The Department of Ecology's mandate is to protect the environment not to protect jobs. I trust some of you at Ecology are familiar with the controversies over siting the Satsop nuclear plants and how some workers there did make very good money only to have the projects shut down because they were too costly. The "benefits" of building this Kalama Methanol plant will accrue primarily to the corporate entities behind the project and not to workers in SW Washington and certainly not to local residents and taxpayers. The risks to our environment are burdensome to this and future generations of wild and human life and must not be dismissed as uncertain. The project will be a massive greenhouse gas emitter and is in stark opposition to our legislative goals of net zero emissions by 2050.

Please deny the project and save Kalama and the rest of us from this climate calamity in the making.

Thank you for your attention.

Kristin Edmark

Please add a background section to the SSEIS regarding Climate goals of Washington State and other jurisdictions. The SSEIS should clearly state that:

1) In spring, 2020, the Washington State legislature accelerated its emissions reductions goals to 45% below 1990 levels by 2030.

<http://lawfilesexternal.wa.gov/biennium/2019-20/Pdf/Bills/SessionLaws/House/2311-S2.SL.pdf#page=1>

As more people are personally impacted by climate change and the costs to state and local governments increase with increased climate related disasters, goals are expected to become more rigorous.

2) There is likely to be a new Federal Administration committed to climate goals. A new federal administration will work internationally to establish goals and decrease emissions. These steps would likely conflict with the increased extraction needed to provide fossil fuels to the refinery.

3) Local jurisdictions are increasingly making climate Action Plans and adding ordinances to decrease emissions. For example, already 20 cities in California, and 10 cities on the east coast are developing policies to require new construction to be all electric. Many cities in Washington are moving in that direction. For example, Bellingham's Climate Action Plan has set the goal to further reduce municipal greenhouse gas emissions to 85% below 2000 levels by 2030.

4) Given that the refinery would produce 4.6 million tons of carbon dioxide/year, this one project would be equal to around 5 percent of the state's total climate emissions from all other activities combined. In the State of Washington, greenhouse gas levels are expected to increase by 1% if this methanol refinery is built.

It is very important that the Kalama methanol refinery does not conflict with major State goals and the goals of other jurisdictions. Please include these goals in the background section of the SSEIS.

Tara Ohta

I'm writing to urge the Department of Ecology to reject the proposed Northwest Innovation Works methanol refinery and to deny the Shorelines Permit for the project. I care about this because I love our beautiful Earth and want future generations to be able to know it as I have been blessed to do. I want my children and grandchildren to be able to live their lives safe from the effects of air and water pollution and climate change, which cannot happen unless we reject fossil fuels now and embrace renewables. The proposed refinery would move us toward climate catastrophe rather than toward the low-carbon future we must achieve if we are to save life on Earth as we know it. Please, please reject this methanol refinery!

Deborah Kaye

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Paul Eisenberg

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Fred Suter

Department of Ecology - thank you for extending the comment period. We just learned that China announced it would achieve a peak in carbon dioxide emissions in less than 10 years and be carbon neutral before 2060.

This reduces significantly the draft SSEIS GHG emissions the Kalama Methanol Refinery is projected to avoid by assuming it will replace Chinese production of methanol utilizing coal fired power with Kalama's production of methanol utilizing natural gas.

This assumption is no longer valid. We're being told China's announcement will have significant impact on oil and coal consumption, and in turn, the GHG emissions projected in this SSEIS.

I urge you to take this latest development into account and furnish decision makers with accurate information on this project's impact to the State of Washington.

Sincerely,

Fred Suter

Lisa Critchlow

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Margaret Bone, MD

Dear Department of Ecology People,

As almost everyone agrees, we are already in deep trouble with accelerating climate change. Just with this recent spate of wildfires, researchers at University of Washington and at Stanford estimated 200 excess deaths in Washington due to smoky air last month, (<https://www.kuow.org/stories/wildfire-smoke-may-have-contributed-to-nearly-200-deaths-in-washington-this-month>), while hurricanes ravage communities, and ice and "permafrost" melt. The first thing to do when you find yourself in a deep hole is to stop digging. Committing ourselves to 40 more years of fossil fuel pollution and risk of catastrophic accidents is tantamount to digging ourselves a deeper grave.

Having listened to one of the hearings, many of the points in my mind have been made, and I want to emphasize a few.

Increasing carbon pollution is deeply racist, as people of color and in general poor communities are sacrificed with shorter lifespans from a whole host of negative health effects.

I still think, even in this Second Supplemental EIS, the methane leakage estimates are too low, and leaking from abandoned wells needs to be considered as well. (e.g. Fracktracker Alliance March 29, 2019 by Kyle Ferrar, MPH) This demonstrates the long term leaking from abandoned wells, even from under sidewalks in downtown LA.

The assumption clung to by supporters of the project, no doubt including well-intentioned community members, that this project will contribute less to climate change than the alternatives, specifically coal, as illustrated in one of the graphs in this EIS, is deeply flawed.

We should not assume that China will just use coal if we don't send them natural gas. There is substantial opposition all over the world to the development of coal resources. According to the Environmental Law Alliance Worldwide, "local advocates [who] helped halt coal-fired power plants in Egypt, India, Kenya, Senegal, South Africa, Sri Lanka and Thailand; shelved proposed coal mines in Brazil, the Philippines and Poland, and shuttered a coal mine in Chile." (ELAW Advocate, Autumn 2020) As you know, the economics of renewable energy sources and storage are improving rapidly, and in many areas is already cheaper than fossil fuels, and China has just announced it will reach peak emissions by 2030 and be carbon neutral by 2060. We should be supporting, not subverting that effort.

One of the major arguments made by fossil fuel project proponents is that it is 'better to have fossil fuel production here where we have good environmental laws'. This naive and insulting, similar to initially blaming the 737-Max crashes on 'those poorly trained pilots from other countries'.

This ignores not only the trauma to Indigenous communities subject to destruction of their territories, rape and murder of their populations by workers in man-camps, and the abysmal record of leaks and explosions from transport of natural gas.

As for plastics, they are a menace to our environment, so any amount of olefin is a negative also. To the argument that we need plastics for many of the things we use every day, there is active research on alternatives and I don't believe that research will take 40 years. In the meantime, there is an abundance of plastic that can be reclaimed.

Writing you from a place of deep grief as places I spent a lot of time in as a kid have burned this week, I implore you to reject this shortsighted, dangerous and destructive proposal.

Sincerely,
Margaret W. Bone, MD

Elijah Cetas

Greetings,

My name is Elijah Cetas, I live in Portland, Oregon, and organize with Sunrise movement.

As a young person, a conservationist and a fisherman, I strongly oppose this project.

Alone, the risks and impacts to endangered salmon and steelhead runs of the Columbia river make it a nonstarter.

I understand why Ecology has included an assessment of whether Kalama might displace coal plants in China. Global greenhouse gas mitigation is complicated. But what i fail to understand is why this was the only future scenario that Ecology explored. What led this agency to ignore and not assess other potential futures that might not include releasing 40-million tons of added CO2? As a young person who will face the impacts of the climate crisis throughout my lifetime, it is deeply important to me to acknowledge that this project would emit the equivalent to 8.6 million new vehicles on the road, or 10 new coal fired power plants. Longterm projects cannot ignore immediate impacts.

One likely and dismal future Ecology might have explored is one where global plastic production increases. China continues to produce methanol from coal, while new pipelines are built to supply Kalama Methanol. New plastic facilities open in the U.S and abroad. The plastic industry - an investment haven for fossil fuel companies intent on maintaining fossil fuel profits in spite of climate change - this industry continues to undercut sustainable alternatives and choke our oceans with debris. Meanwhile, under this future scenario, we in the pacific northwest still see the price of gas in our homes driven up by this project's monopolistic control of regional gas supply lines.

Then again, the opposite eventuality could occur. At much cost to the local ecosystems and our clean water, let's say this facility is built and operates for five years. Then, before the coal plants go down in china, a climate disaster, another pandemic, a spate of wildfires, or a plastic alternative emerges, driving down demand for fracked gas while the global supply becomes glutted. Eventually the Kalama Methanol project closes, after a short lifespan of wasted greenhouse gas emissions. Meanwhile, we are left to clean up the mess. And for what?

This is of course exactly what we are witnessing with the oil industry during the Covid-19 pandemic. Flotillas of oil storage vessels are currently waiting off our coasts, while global demand stagnates. Fracking fields have been abandoned, wellheads are improperly closed and leaking methane, and the companies responsible are avoiding cleaning them up.

Why is Ecology propping up the straw man argument of a foreign company, intent on using out of state workers and fanciful financial speculations to degrade our local resources and imperil our communities health and safety in order to extract profit for a multinational corporation and its foreign bank accounts?

What would it look like for Ecology to take our the immediacy of the climate crisis seriously, and analyze other likely scenarios? Perhaps even imagining the greenhouse gas benefits of not building

this plant, and instead investing in renewable energy, in environmental restoration, and deconstruction and retrofitting jobs that help prevent disaster from the Cascadia earthquake. This work of community resiliency isn't going away in our lifetimes. Yet when a project like Kalama Methanol is proposed, we have to fight that much harder to see climate resilient investments in lieu of fossil fuel projects.

Facing these complexities, Ecology must return to its mission: protect the health of local lands and communities. Reject this project and demonstrate the many good reasons to use our waterways and ports for other purposes.

Thank you,

Elijah Cetas

er.cetas@gmail.com

Vicki Bucklin

I believe Kalama and Our River Are Being Threatened by Corporate Greed

If you haven't heard of "Cancer Alley" please look it up before you decide it's a good idea to build the LARGEST METHANOL PLANT IN THE WORLD, right in our neighborhood.

I live on Puget Island and my family supports the following groups:

Wildlife Center of the North Coast

Portland Audubon Society

Columbia Riverkeepers

Columbia Land Trust

Every single ONE of these groups are steadfastly AGAINST the approval of the proposed Kalama Methanol project.

Why? Because for the past 20 to 30 years they've done their best to mitigate & prevent exactly the kind of pollution this project is guaranteed to cast upon our environment.

It's a known fact that this proposed methanol facility will produce substantial increases of pollution in our AIR, our RIVERS, and all along the pipelines and railways that carry the inbound raw materials.

Profiteers tell us they'll maintain "acceptable levels" of ongoing emissions which are known to contain carcinogenic pollutants. To those of us who care about our children & grandchildren, THERE ARE NO ACCEPTABLE LEVELS!

China wants US to build this plant right here, right now, because CURRENTLY, it is the cheapest way for them to obtain raw materials to make plastic. China HAS resources to make methanol. This option is simply less expensive right NOW.

Please go online and look at Webcams in China. The smog levels you'll see are shocking.

SHOULD we export our NON-renewable US natural resources to China? Are we doing the right thing by providing them with more US fossil fuels?

We can regulate LOCAL pollution, but once we ship our methanol overseas, we sacrifice our rights to control it's use. However, we can't escape the same biosphere.

What will happen once we've made this deal, and then the price of oil, or the temperament of our relationship with China, have changed? Be assured, over time these things WILL change.

What will happen to this behemoth of a plant after an earthquake, a catastrophic spill, or any other disaster?

What will happen to the plant's production when fossil fuel extraction, fracking, or fuel

transportation methods are outlawed in those zones we DON'T control?

And indeed, what happens when our US raw materials have been depleted, and China still has their own?

We need clean jobs that are sustainable beyond the next 50 years, not projects that may become obsolete in the next 5 to 15 years.

The real push for this project is driven by nothing more than the expectation of huge corporate profits. We're being offered around 1000 jobs during construction, and then LESS than 200 permanent future jobs for Kalama.

It isn't worth the cost. It's just like ANY deal with the devil...

The greatest known personal health risks, reduced property values, and environmental damages WILL be borne by our local families, NOT the corporations seeking to profit.

The greatest beneficiaries of this project will BE those corporations, NOT the workers, and not your families or mine.

As a resident of the Lower Columbia River, and a citizen who has worked hard to keep it pristine, I feel that this methanol project is a VERY bad idea.

In the interest of our community's health and environment, we must STOP this project.

JoANN Zugel

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

CS Dragonwyck

One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Querido Galdo

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Nancy Helget

I'm writing to urge the Department of Ecology to deny the NWIW permits. I've made two previous comments. I'm submitting another comment because new evidence about China's future intent to reduce GHG emissions is relevant to both of my prior comments.

My first prior comment asked the Department of Ecology to deny the NWIW permits because GHG emissions attributable to the facility are significant and NWIW's proposed mitigation plan won't reduce GHG emissions in Washington. Operation of the NWIW facility will assure the state won't meet the statutorily required GHG emission reduction, even assuming every NWIW mitigation effort offsets other Washington GHG emissions. An offset does not achieve a reduction. NWIW's GHG emissions will make statutory reduction requirements much more difficult to achieve.

My second prior comment asked the Department of Ecology to deny the NWIW permits because the SSEIS conclusion relies on a speculative assumption. The SSEIS relies on the assumption the NWIW facility will "... prevent utilization of other more polluting processes, particularly in China." SSEIS 3.5.1.4.

As reported in Steven Lee Myers' Sept. 23rd New York Times article, China's Xi Jinping has recently pledged to make China carbon neutral by 2060. China's carbon neutrality goal invalidates the SSEIS assumptions that NWIW methanol will supplant China's more polluting methanol sources.

If China intends to become carbon neutral by 2060, it will be pursuing ways to reduce and/or eliminate all GHG emissions over the NWIW project life. That includes reducing or eliminating GHG emissions from methanol. China's reduction of methanol use could leave NWIW producing a significant GHG pollutant that doesn't have a market in China. If China isn't buying NWIW methanol, the NWIW facility won't "... prevent utilization of other more polluting processes, particularly in China." The SSEIS assumption is speculative at best and the Department shouldn't rely on it to grant NWIW permits that will result in significant GHG emissions.

The new information about China's intent to be carbon neutral by 2060 also calls into question NWIW's representations about its ability to mitigate its Washington emissions. If a polluter as large as China is reducing GHG emissions, there may be fewer opportunities for NWIW to mitigate its Washington GHG emissions. Although NWIW assures it will look to mitigate Washington GHG emissions first, there's no assurance it can or will do that. NWIW may have to look globally for mitigation opportunities.

The SSEIS has no specifics about any current or future available mitigation sources, in Washington or elsewhere. Although China's GHG reduction efforts could have a significant effect on NWIW's opportunities to mitigate, the SSEIS doesn't sufficiently address this issue. Instead, the SSEIS allows NWIW to make the unsupported and unspecific representation it will mitigate all of its GHG emissions.

While it's true that cynics could dismiss China's announcement as a public relations effort and argue China has no intent to be carbon neutral by 2060, the announcement makes it clear just how

unsupported the SSEIS assumption is. China's announcement makes it clear no one, certainly not NWIW or the Department of Ecology, can predict what China will do now or for the next 40 years.

It's worth repeating. The NWIW GHG emissions, if allowed, will be "significant". The Department of Ecology shouldn't rely on speculation or erroneous assumptions to support granting any permit for a facility that will produce significant GHG emissions. Our state is actively pursuing a policy that will reduce, not increase GHG emissions. The NWIW facility is inconsistent with that policy. I urge you to protect Washingtonians and deny NWIW's permits.

Thank you for considering my comments.

Carol McMahon

It is irresponsible to construct a mammoth methanol facility that will endanger our planet and destroy the ecology of southwest Washington and northern Oregon. I have uploaded a copy of the resolution passed by the Washington State Democratic Central Committee in 2017 opposing this facility. Much like the LNG facility in Tacoma, little consideration for the safety and well being of tribes and nearby population as well as the environment have been given. The resolution supports the state Party Environmental platform.

Key elements of the attached resolution call attention to our state's commitment to support the Paris Climate Accords, that this proposed facility would be the largest in the world drawing 5 million gallons of water daily from the Columbia and Kalama aquifers and produce more than all gas fired power plants in Washington combined.

Further, the resolution identifies the site as high risk of liquefaction, and tanker traffic is expected to harm endangered salmon and whales (a keystone species in our ecological system) through fish strikes - a common problem in sea traffic lanes.

Finally, the facility will not produce substantial benefit locally or nationally, with few permanent low-wage jobs. I encourage you to consider this resolution in your decision, and deny the construction of the Kalama Methanol Facility.

Resolution In Opposition to the Kalama Methanol Facility

WHEREAS a mammoth, foreign-owned methanol facility has been proposed for construction on the east bank of the Columbia River in Kalama, Washington;

WHEREAS the Washington State Democratic Party Platform calls for “immediate aggressive action to minimize climate change, as global climate change is the foremost threat to survival of Earth as we know it,” and Governor Inslee has affirmed his commitment to supporting the Paris Climate Accords;

WHEREAS the proposed Kalama Facility would be the largest methanol facility in the world, drawing 5,000,000 gallons of water daily from the Columbia and Kalama River aquifers and utilizing 320 million cubic feet of natural gas daily – more than all other gas-fired power plants in Washington combined;

WHEREAS 72 million gallons of flammable methanol would be stored on local soil that has a moderate to high risk of liquefying in an earthquake;

WHEREAS three to six tankers a month would be needed every month to haul methanol to China for use in manufacturing plastics there, an increase in ship traffic that would harm endangered salmon that are already stressed and produce ship strikes likely to kill or harm whales near the mouth of the Columbia;

WHEREAS the facility would emit more than a million tons of climate pollution per year as part of the manufacturing process, and shipping its output to Asia would generate hundreds of thousands of tons of additional climate pollution per year, while the methane emitted by fracking and pipeline transport to supply the facility would make greenhouse gas emissions rise even further;

WHEREAS at a time when we need to phase out reliance on fossil fuels and transition to clean energy, the project would encourage new gas drilling and fracking;

WHEREAS the proposed facility would not replace any coal-based methanol in China;

WHEREAS private property and historic cemetery land would be seized to make way for the three-mile long gas pipeline needed by the Kalama Facility; and

WHEREAS the proposed facility would produce no substantial domestic benefit, either locally or nationally, with only a few permanent low-wage jobs not necessarily filled from local communities;

42 **THEREFORE BE IT RESOLVED** that the Washington State Democratic Central
43 Committee firmly oppose construction of the proposed Kalama Methanol Facility, and
44 urge the Governor and the State of Washington to reject it forthwith.
45

46 Submitted by the Environment and Climate Caucus on 9/9/17.

47

48 The Resolutions Committee recommended that the resolution be sent to the floor.

49

50 The Washington State Democratic Central Committee passed the resolution.

William Insley

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Rayna Holtz

My comments fall into two categories. First I look at the issue of greenhouse gas emissions that this study so wonderfully examined with considerable care and research, to see the greenhouse gas emissions results of various scenarios depending on whether the Kalama Manufacturing and Marine Export Facility (KMMEF) is built, versus results if it is not built. Second, I look at the context for this study, and for the Washington State governor's and legislature's 2020 progress on charting an effective path to comply with guidelines framed by the world's experts (Paris Climate Accords, International Panel (IPPC ??). In both cases, I look at not only market forces, but at forces increasingly being mustered to counter market pressures with regulations and incentives that prioritize environmental health and the long term survival of human and other species over market trends driven by profit incentives.

A. The depth and breadth of this SSEIS is impressive, as is the broad range of possibilities it must contend with. It suffers from errors, omissions, assumptions.

1. One unknown is how the methanol will be used. We do know that Northwest Innovation Works (NWIW), which is Chinese backed, told the Port of Kalama that the Kalama plant would primarily sell its methanol to markets for olefins in Asia, but when presenting the project to potential funders it emphasized profits from selling the methanol for use as fuel. This behavior does not inspire confidence, and does warn that NWIW will be manipulative to achieve a for-profit goal rather than speak out of a confirmed set of ethical guidelines incorporated into the operations of its business. (Why should we assume that NWIW will follow through with its promised voluntary mitigation plan?)

2. To try to account for the uncertainty about intended uses, the range of models in the SSEIS includes both fuel use and MTO (methanol to olefins), but looking at Fig 3.5.3 on p.65 we see that the Chinese use of methanol for fuel quintupled from 2006 to 2016 and it continues to rise. Why do we assume the use of fuel will not overtake the use for olefins? Beyond this example the number and combination of variables far exceeds the capability of meaningful modeling. While we do not know precisely what the methanol will be used for, we do know that it will add GHGs to our overtaxed atmosphere starting in just a couple of years and continuing for 40 years, including the most critical next two decades when we must reduce GHGs.

3. It is facile to want to partially justify the permitting of a facility that uses fossil fuels, emits GHGs in bringing its raw materials to its site, emits more in producing its product, and still more while conveying its product to Asia merely because it produces just slightly fewer emissions than other producers of its product!!

4. This report uses the IPCC4 100-year GWP values to calculate CO₂e, despite the fact that this chart was subsequently updated to more accurately reflect the significantly enormous GWP of methane in its first 20 years. On p. 90 it even says: "GWP values are periodically updated to reflect current science regarding the energy properties of GHGs and their lifetimes in the atmosphere." Thus the report should be using the most accurate and current GWP values, which are found in the IPCC's fifth Assessment Report's 20-year GWP. The reason it gives for using the IPCC4 100-year GWP is that they are, "The most commonly used GWP values," no doubt because they have been around longest!!! This will certainly bias all the results to minimize the GWP of all the methane emissions. It doesn't matter nearly so much what the total GWP will be over the next 100 years as what it is going to be between now and 2040.

5. The calculations of upstream emissions are not well presented, but seem to minimize the problem

of methane escape at extraction sites. This has been described in National Geographic: "Scientists have measured big increases in the amount of methane, the powerful global warming gas, entering the atmosphere over the last decade." The evidence: "The chemical signature of methane released from fracking is found in the atmosphere, pointing to shale gas operations as the culprit." (Robert Howarth, an ecologist at Cornell University and author of the study published Aug 14 in the journal *Biogeosciences*.)

6. The problem of emissions from pipeline leaks all along the way is not mentioned. Pipelines are made of lengths of pipe connected together by joints. Over time, joints fail, as surrounding earth is disturbed by a wide variety of impacts, or by earthquakes. Not only does this add to our burden of greenhouse gases, it adds threats to the health and safety of communities, rivers, and other ecosystems due to contamination and fire hazard. (Example: "On June 10, 1999, a gasoline pipeline operated by Olympic Pipeline Company exploded in Bellingham, Washington's Whatcom Falls Park." -from Wikipedia)

7. As the Department of Ecology News Release of Sept. 2 states, "The project would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year." And because the report uses the AR4 100-year GWP this under-reports the CO₂e for whatever portion of this happens to be methane, so we need to multiply that figure by 86. Not helpful when our 2009 goal bring our emissions down to 1990 levels by the end of 2020 has failed completely, and instead our emissions have increased by about 8 percent!!! What part of NO MORE EMISSIONS do we not understand?

8. This report does not consider the possibility that yet cleaner processes may soon make the Kalama technology with its "ultra-low emissions" obsolete. One possibility is producing methanol from the carbon dioxide in the atmosphere! ("Carbon dioxide-to-methanol process improved by catalyst," Science Daily, June 28, 2018, Penn State).

9. There is no mitigation that can adequately compensate for adding GHGs to earth's atmosphere at this time in history. Is it OK to just add a little oxygen to a raging house fire?

B. The context for this permitting process is not average. This is a precedent-setting moment, when every person and every life form on the planet is facing a crisis with a magnitude as great as the one that destroyed the dinosaurs. We cannot behave as though it's business as usual, and the best-written set of justifications and excuses wins a work-around to avoid the rules.

1. RCW70A says, under Intent ♦ 2020 c 79: "(3) The longer we delay in taking definitive action to reduce greenhouse gas emissions, the greater the threat posed by climate change to current and future generations, and the more costly it will be to protect and maintain our communities against the impacts of climate change. Unchecked, climate change will bring ever more drastic decline to the health and prosperity of future generations, particularly for the most vulnerable communities."

A new methanol plant in Washington would hinder the difficult task that is so urgent right now: to turn our GHG emissions around. With every passing month, more damage is done because of the effects of climate change, and some of the processes unleashed by global warming are actually accelerating its damage and speed (for example: the thawing of tundra is releasing additional methane that had been sequestered in the frozen tundra!) Climate change is increasing in momentum, so that some damages we can still hope to avert by reducing GHGs this year, will become inevitable if we wait to act until next year.

2. The United States has until recently enjoyed one of the most stable democracies in the world, with time-honored institutions that enabled us to have the rule of law to protect our human rights and welfare. But we have not shouldered the responsibilities that come with our extensive privileges and wealth. According to the Center for Climate and Energy Solutions, the United States leads the

world in Per Capita Greenhouse Gas Emissions, with over 18 tons of CO2 equivalent per person in 2017. Russia follows with a bit more than 15, then Japan with a bit less than 10, and the European Union is at about 8. The U.S. is responsible for 25% of the cumulative emissions of GHGs from 1751-2017, followed by the EU at about 22%. It's high time to step up. No simple for-profit venture, the possibility of initiating a successful new corporate enterprise, can take priority over this existential necessity.

3. Department of Ecology's Perry Lund states in his letter of October 9, 2019, to Dr. E. Elaine Placido, Cowlitz County, that "By law, Ecology must review all CUPs for compliance with the following: 1) The Shoreline Management Act (RCW 90.58)." In RCW 90.58.020, in "Legislative findings ♦ State policy enunciated ♦ Use preference," the third paragraph lists seven uses of state shorelines to guide the development of master programs for shorelines, "in the following order of preference which: (1) Recognize and protect the statewide interest over local interest; (2) Preserve the natural character of the shoreline; (3) Result in long term over short term benefit; (4) Protect the resources and ecology of the shoreline. . ."

Although a Kalama methanol plant may bring jobs and an economic boost to the local folks, the broader statewide interest will be better served with less GHGs and a healthier shoreline. The long term benefit will be much better served by NOT siting an enormous methanol plant where it can jeopardize "the resources and ecology of the shoreline."

This shoreline is closely associated with the magnificent Columbia River estuary, and its health and water quality can affect large communities of marine life both locally and downstream, extending to shorelines north and south along the Washington and Oregon coasts. Further, this ecosystem lies at a critical bottleneck for a majority of Washington's vital salmon runs, which travel from the Pacific Ocean back up the Columbia to numerous feeder rivers draining both the eastern Cascades and the western Rockies, spanning all of eastern Washington and part of British Columbia. These waters must be protected for the sake of innumerable beleaguered salmon stocks that have already been decimated by dams and premature melting of snowpack causing excessive warming of spawning streams that consequently cannot hold adequate oxygen to keep spawning salmon alive. On these salmon runs depend not only fisheries that have supported indigenous fisheries since time immemorial, and more recent commercial and recreational fisheries, but also the iconic Southern Resident Killer Whales of Puget Sound, now unable to find sufficient forage year-round to sustain healthy reproductive adults. It is unwise to allow any more dangers to further transform one of their key habitats into a gauntlet beset with hazards.

RCW 90.58.020 also states, "Uses shall be preferred which are consistent with control of pollution and prevention of damage to the natural environment, or are unique to or dependent upon use of the state's shoreline." There is no industrial plant that is immune to accidents. The siting of a large methanol facility in such a sensitive shoreline with the potential to cause lethal harm to so many already struggling species with both extremely high economic value and incomparable iconic northwest significance poses unacceptable risks of the sort this law warns against.

In summary, the backdrop of climate change against which this methanol plant is proposed, dwarfs all other considerations with its multiple threats and exigencies. We must look at this decision with eyes wide open, and make a decision that will help slow the unraveling of the planetary systems on which biological life depends. Deny the conditional use permit.

Sincerely,
Rayna Holtz

Jim Bain

9/20/20

Department of Ecology-WA state

I am a Cowlitz County Planning Commissioner, writing as a private citizen.

I urge you to do everything in your department's power to see that all state permits are issued for the KALAMA NWIW project.

It does the state harm to continually DELAY a decision on a project that meets the CURRENT laws and standards- not what some WISHED were in place.

Thank you, Jim Bain

Laura Gibbons

This would be an environmental disaster, both in the short term and as the use of carbon-based fuel accelerates climate change. Please please please don't be steam-rolled by industry or fooled by promises of short-term economic benefits. As the department of Ecology, thing big, protect me, and reject the facility.

patrick BOOT

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this projects impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washingtons climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

PHIL RITTER

I oppose approval of this project because the cumulative methane emissions created at the wellhead, in transit and at the proposed facility will exacerbate the damages of global warming. The end product of the chemicals produced at the proposed facility will be used to create plastics which cannot be recycled and will end up in the oceans and in human and animal tissue. In addition, if this facility is approved and constructed it will have to be shut down before the end of its useful life to achieve compliance with emissions restrictions to be imposed in the future in accordance with international agreements, and at that point it is highly likely that the government will have to compensate the owners for the remaining undepreciated book value of the asset.

Laurie Dils

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Sarah Palmer

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Jane Nicolai

Dear Department of Ecology,

The current EIS compares the proposed Kalama methanol facility with one that doesn't exist, comparing make-believe numbers against the stated 4.6 million tons of climate pollution every year for forty years this facility would produce. Compare it to NOT building the site and you will find the real numbers represented here.

Add the destruction of building the pipeline, the damage of eminent domaine, the eye-watering, cancer causing pollutants up and down the Columbia River, and INCREASED POLLUTION AT EVERY STEP OF THE PROCESS it is your duty (and mission statement) to deny this permit.

marilee dea

Kalama Methanol Terminal

My name is Marilee Dea, I am a public health Pediatric Nurse Practitioner. I coordinated pediatric prevention programs for Multnomah County, including the Lead and Asthma prevention programs.

We found that folks that live near air polluting industrial plants busy diesel truck roadways had a much higher rate, 40 % higher rate of asthma episodes. Why, because of visible and invisible gas, smoke, dust is being inhaled- especially diesel fine particulate matter in an irritant to the lungs.

The Kalama methanol refinery, the largest methanol refinery in the world, will have mile high plumes releasing carbon monoxide, nitrogen oxide, sulfur dioxide, volatile organic compounds and fine particulate matter. Methanol, itself is highly flammable and toxic to humans and animals. People living near this plant will be at higher risk for asthma because the visible and invisible irritating chemicals are inhaled.

.

How many of you have seen a severe asthma attack or have friends or family with asthma? It is scary, this is what is happening- when the irritant or allergen is inhaled~ causes airway swelling, mucous, chest muscle tighten and the airway narrows, it can get so tight it is difficult to get air in or out of the lungs, hence wheezing and coughing occurs to force air in and out. You can't speak in full sentences, you get confused and need to sit or stand to breath- your face begins to turn blue. What should you do? Get their restrictive clothes off, run for the inhaler, and emergency meds if they have them. Have them take long slow deep breaths and pray they get better and prepare to get to a hospital. I have had a friend die at the beach because he was too far from a hospital. Is this the life you want in Kalama- especially in the summer when it is hot, smoggy or when forest fire smog rolls in.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Judy Arielle Fiestal

I am a 71 year old retired teacher from Portland, Oregon and now living in Ferndale, Washington. My sons and my grandchildren live in Portland, Lake Forest Park in Washington and Ferndale. What happens in Kalama affects us all.

What is the legacy do you imagine for yourselves? Are you wanting to be responsible to make a decision that will bring our environment to the brink of collapse or would you rather be part of the group of leaders that will look at reality and bring us to a future that our children and grandchildren can live in?

We have all experienced the smoke of the west burning this past month. Some worst than others. In Portland what used to be for us a lovely clear and warm summer month turned into a toxic stew for us to breathe. 250 miles north it was not as lethal but hazardous to our health to be outside. Your decision in regards to the proposed Kalama Methanol Refinery will define the world that we will live in.

Washington makes claims of wanting to meet climate goals that will turn around the course our civilization is taking. Approving a dinosaur aged methanol refinery plant that will produce 4.6 million tons of carbon pollution or more each year is not consistent with healing our planet. It is not consistent in protecting Washington shorelines, not consistent in protecting the health of our communities with good air quality, and is not consistent with keeping global temperature rise below 2 degrees C. In short it is not consistent with supporting our planet with life as we know it and love.

And for what are you willing to sacrifice so much? So that Northwest Innovation Works can continue to profit from the degradation of our environment? So that the destructive practice of fracked gas that lays waste the area from which it's extracted continues? So that we can help China produce more plastic that is polluting our oceans and our environment at a frightening rate? So that we will continue to produce more carbon than all the gas-fired power plants in Washington combined?

Some say it's for jobs. We need government leaders who can look to the future to expand our alternative energy sector to create jobs that will help our society and not be hurtful to our environment. It is long past time that we have leaders who are willing to press forward on a new course for healing. Are you those leaders?

I urge the Department of Ecology to reject the methanol refinery and to deny the Shorelines Permit for this project.

Sincerely,
Judy Arielle Fiestal
Portland, Oregon and Ferndale, Washington

Washington State Department of Ecology
Olympia, Washington

Re: Formal Comments on Kalama Manufacturing and Marine Export Facility Draft Second Supplemental Environmental Impact Statement, September 2020

Please deny Kalama Manufacturing and Marine Export Facility (KMMEF) a shoreline substantial development and a conditional use permit. The environmental impacts from the project are significant and cannot be mitigated.

Greenhouse gas emissions are insufficiently explained in the draft second supplemental environmental impact statement (SSEIS) and the data contains errors and omissions.

The greenhouse gas emissions from KMMEF marine dock operations are not examined in the DSSEIS and need to be evaluated and added to total project emissions.

The KMMEF marine dock is integral to this refinery project, otherwise we could just refer to it as the NWIW refinery project. However, GHG emissions, from dock operations have not been examined in this draft SSEIS or in the first supplemental environmental impact statement.

The first SEIS simply deferred discussion of marine dock GHGs, different from methanol vessel transport or process emissions, to what was included in the FEIS.

The FEIS states-

"The proposed marine terminal would accommodate the oceangoing vessels that would transport methanol to destination ports. It would also be designed to accommodate other vessel types and, when not in use for loading methanol, would be made available for use as a lay berth where vessels could moor while waiting to use other Port berths or for other purposes." 2.1

"The proposed project also incorporates the use of shore power for the marine terminal. Shore power allows ships to "plug into" electrical power sources on shore. Turning off ship auxiliary engines at berth would reduce ship diesel emissions and result in GHG emission reductions, depending on the source of electric power from the grid. GHG emission reductions from shore power have not been calculated for the proposed project, but studies completed in other locations show reductions of from 25 percent to 50 percent (EPA 2017)." p. 3-35&36

"Marine Terminal Alternatives

The Marine Terminal Alternatives would both result in the same potential impacts to energy and natural resources and are assessed together.

Both Marine Terminal Alternatives would generate demand for electricity for lighting, loading equipment, and the operations shack and dockworker shelter. They would also generate demand for electricity from the use of shore power (also known as "cold-ironing"). Both Marine Terminal Alternative would generate a peak electrical demand of approximately 3 megawatts (accounting for both methanol loading activities and the use of shore power by vessels serving the methanol manufacturing facility and lay berth vessels), and an estimated annual electricity use of approximately 11,000 megawatt-hours based on preliminary engineering estimates. This electricity demand would be negligible compared to the approximately 5 million megawatt-hours of energy sales by the Cowlitz PUD in 2013.

Therefore, the operation of the Marine Terminal Alternatives would not result in significant adverse impacts to energy and natural resources." P. 7-7 & 8

In the analysis of purchased power only power associated with methanol process is examined, not that from shore power required by vessels at berth, estimated to be 72 visits from Panamax methanol tankers and up to 12 other vessels using the dock as lay berth per year. (I will note this area of the river recently acquired additional stern buoys, meaning additional vessels under their own power awaiting berth will be emitting GHGs and air pollutants in the region.)

Looking just at shore power (aka cold-ironing or shore to ship power) use from vessels at berth, the preliminary estimate of 11,000 MW hours annually is likely lowballed. Per EPA GHG calculator this low amount of electricity generates 7,777 metric tons of CO₂e. This is more than other GHG emitting activities analyzed in both SEISs.

The peak electrical demand of about 3 megawatts is also of dubious credibility. The first shore power installed at a terminal for tankers in 2009 at Port of Long Beach had a capacity of 8 MW.

"What is claimed to be the world's first oil tanker terminal equipped with shore power to eliminate air emissions from berthed vessels was unveiled this week.

Pier T at the Port of Long Beach, used by BP America affiliate Alaska Tanker Co, has been equipped with a BP shore power installation, which can deliver up to 8 MW at 6,660 v."

<http://www.tankeroperator.com/news/first-tanker-cold-ironing-facility-opened/1231.aspx>

The Port of Boston commissioned a study to evaluate shore power requirements for various vessels and found power demands ranging from 3.36 MW to 13 MW.

"One Container vessel requires as much power as the largest Logan Airport Terminal (3.36 Megawatts).

Significant peak power demand on electrical grid. Just one cruise ship (Queen Mary 2) requires electrical demand equal to all required power to service all Logan Airport Terminals (13 Megawatts)."

Massport Shore-to-Ship Power Study August 5, 2016

https://globalmaritimehub.com/wp-content/uploads/attach_770.pdf

More recently the California Air Resources Board is determining regulations for emissions from ocean-going vessels at berth. In a lengthy report the following was stated about tanker vessels, "On average, a tanker's auxiliary boiler can require one to several thousand kW of power during pumping operations, while auxiliary power load consumption for regular hotelling operations generally ranges between 700 kW to 1,000 kW per hour (Appendix H). Hotelling times for tankers transporting crude oil range between 5 to 173 hours per visit I-29 5. and the average berthing time for a product tanker is around 48 hours." p. I-29, State of California AIR RESOURCES BOARD PUBLIC HEARING TO CONSIDER THE PROPOSED CONTROL MEASURE FOR OCEAN-GOING VESSELS AT BERTH STAFF REPORT: INITIAL STATEMENT OF REASONS DATE OF RELEASE: OCTOBER 15, 2019 SCHEDULED FOR CONSIDERATION: DECEMBER 5, 2019

<https://ww3.arb.ca.gov/regact/2019/ogvatberth2019/isor.pdf>

I strongly urge you to review the above CARB report. California is suggesting stricter regulation of vessel emissions at berth from ports with more than 20 ocean-going vessel calls per year.

'CARB staff's proposal to further reduce emissions from ocean-going vessels would require emissions control requirements at any port or independent marine terminal exceeding a specific visit activity threshold. If a port or marine terminal surpasses the 20 visit threshold, they must submit a plan to CARB by the end of the following calendar year describing how they will control emissions from the vessel activity at their facility." P. ES-15

This one new Kalama dock would receive four times the vessel traffic under the California regulation requiring stronger emission controls.

The FEIS statement the Marine Terminal Alternatives are not significantly impactful is false. Please rectify the serious omission of greenhouse gas analysis from vessels at berth at the proposed KMMEF marine dock in the second supplemental EIS.

Thank you,

Diane L. Dick
Longview

Jean M. Avery

As we've seen in 2020, our lives can be drastically changed in a matter of a few months. Accordingly, it is unrealistic to predict what may happen within the coming forty years. As the Dept. of Ecology considers the proposed NWIW project, I strongly urge consideration of the following what-if scenarios:

1. What if the renewable energy sector continues to grow, and Kalama, WA is left with a stranded asset that perpetuates the outmoded fossil fuel legacy?
2. What if a cleaner project is proposed for Kalama's port, but it has already committed to NWIW's methanol plant?
3. What if China moves forward with low-carbon goals (as Pres. Xi recently pledged to do) and China no longer meets its energy needs with fossil fuels, as now assumed?
4. What if financial trends favor investments in low-carbon technologies, as some ESG funds project?
5. What if political tensions increase between the U.S. and China and a hostile adversary controls a key port on Washington's coastline?
6. What if water becomes increasingly scarce, but we continue to give it away for NWIW's project and profit?
7. What if NWIW's jobs are filled with specialized workers from outside the area, instead of workers in Cowlitz County?
8. What if new workers moving to the Kalama area add to the demand for housing, thus raising housing costs for current residents?
9. What if recovery of SW Washington to its pre-NWIW status takes decades? (Think: we're just now 40 years after the Mount St. Helens eruption.)
10. What if Washington's natural resources are depleted, at a high environmental cost with questionable gain?
11. What if we really have a chance to reduce global warming and we miss our opportunity? ("Drawdown" researchers present data-driven strategies that could lead the transition to a renewable, clean-energy future. See <https://drawdown.org>.)

Please consider these possible ramifications before deciding on this project and its consequences. Please deny the permits for the NWIW refinery.

Kathryn Rose

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Geoff Wilson

We live in a time of active climate change. All resources that are potentially hazardous to the environment need to be reconsidered strongly. Methane is a particularly harmful gas to the environment. For this reason I am strongly opposed to all methane producing products at this time.

Rhonda Hunter

As a former career employee of Ecology, I know the agency works hard for the greater good and adherence to clear science. Our Washington State fire seasons are growing far worse as the climate crisis accelerates. This proposed Methanol Facility in Kalama will only increase that acceleration, not slow it down. Please deny and REJECT this dangerous project.

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIWs proposed facility would be enormously polluting.

The evidence in this draft SEIS demonstrates that Washington should deny NWIWs proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Nina Le Baron

I feel that it important to protect the salmon, the orcas, the state, and the planet. Do you? We need to stop using fossil fuels NOW. Switch to non-polluting renewable energy NOW. We have GOBAL WARMING< FIRES ALL OVER THE COUNTRY!!!!!! STOP!!!!!!!!!!

Deirdre Morris

Please do not do this . Thank you

Donald Greenberg

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Robin and Tom, MD Donnelly

The Kalama refinery is a bad idea for Washington and the earth. Climate change is catching up to us and we need to set a better example for China and the world.

Plus we don't need MORE big ships causing sound pollution for our Orca or creating a possible oil spill decimating our beaches, marine life and waters. Say NO!

Tracy Ceravolo

The SSEIS makes the huge assumption that China will continue down the path of using coal unless NWIW brings new methanol online, in which case it will replace that amount of coal with methanol. This is an absurd assumption. China wants to reduce their greenhouse gas emissions, so they will look for a way to do that. Coal doesn't make sense any more. Renewable energy sources are less costly than coal, so perhaps you should look at methanol coming from Kalama vs. wind turbines, solar, geothermal, or even some emerging technology that uses wave or tidal energy. To say that continuing to drill new wells and frack gas to help the climate is completely incorrect and insulting.

We have known about Global Warming for more than 4 decades. It would be criminal to allow the permits to build this facility which will contribute to the Climate Crisis and harm our future!

Susan Schenkel

How is it possible that eminent domain can be used to benefit a foreign company, especially one from a country that is often considered a rival to the United States? Pipelines would run across lands that will be seized through eminent domain all to benefit a Chinese company. How is this possible? How is this to the public benefit? Not only is this for a Chinese company, but adding more fossil fuels to our atmosphere actually does NOT benefit anyone globally except for the few people who are profiting off of fossil fuel extraction and use. I'm sure the Chinese people would also rather have a clean, renewable source of energy locally than having methanol shipped from abroad, adding to Climate Change worldwide.

Deny these permits, because you are the last line of defense on this. We must stop using fossil fuels and pretending that it doesn't matter. It matters!!!

Patricia Hansen

This is a very bad idea and an environmental tragedy in the making. It is a great source of pollution and a hazard to the Orcas as well.

Fred Greef

The upstream methane releases from fracking cannot be regulated due to the Dick Cheney Loophole. This proposal will result in a huge increase in fracking due to the overseas methanol market in China. The methanol is not needed in this state or even this country. There is no mitigation proposed for the vast methane releases. These releases may be worse than suggested in the conservative SEIS estimate. A worst case number should be used instead since the actual amount is unknown and cannot be regulated.

The downstream CO₂ releases from methanol used as fuel instead of plastic should also be looked at as worst case, since China cannot be regulated either. No mitigation is offered in the EIS for the potentially huge significant global warming impacts set in motion by this proposal. This is more gas and more fracking than is used by all of the Northwest's biggest cities combined. If approved Washington State is directly responsible for these emissions that have not been addressed by any type of enforceable mitigation in the SEIS.

The local Washington State air quality impacts to the population of Longview were also not well addressed. The added daily diesel emissions from barges and tug boats on the Columbia River as well as the daily new methanol plant emissions directly upwind of nearby Longview will result in more deaths among the elderly and those with compromised respiratory health. The air quality in Longview, especially along the River and train tracks already causes documented health and death concerns. The cumulative effects of these 2 new sources of air pollution were not well documented in the SEIS for the already compromised Longview airshed. These impacts are worse than those in Kalama where the existing air quality is better. Since these impacts are largely unknown and affect many more people than just Kalama and can actually be calculated, they should be considered significant until such calculations are conducted. Ecology has the expertise to monitor existing air quality in riverside longview residences, schools, and nursing homes. The existing air quality concerns along the riverside communities in Longview should be documented. The cumulative effects of the new impacts should be modeled by Ecology's air quality scientists and added to the existing air quality impacts before any conclusions can be made about the significance of the local air quality impacts of this proposal.

Kathryn Keiser

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Janet Hurt

Dear Director Watson and Department of Ecology:

I have looked at information in support of this project (and in support of methane in general) and it just does not make sense to me. Basically, the argument seems to be that this project will decrease greenhouse gasses, because if it's not built, then WORSE projects will be. This seems ridiculous. Our choice in this SHOULD NOT be about choosing the "lesser polluter" – this is simply not good enough in our current era of climate change.

I do not understand why any entity, private or public, is investing in technology that is at all fossil-fuel based, that adds ANY pollution or greenhouse gasses to the environment at all. We cannot afford to put any greenhouse gasses into the environment. Mitigation or "lesser of two evils" seems like a very shortsighted "solution" to dangerous impacts on the environment.

We – all of us, private and public entities – should be investing in, researching, building, creating systems that truly do not create any pollution or environmental damage. No fracking. No fossil fuels. No more methane. No capitalizing on global markets that are contributing to pollution and waste in any way. There must be other options. We are smarter than that. Tremendous human effort goes into short-sighted, profit-making energy and product production. Tremendous effort has gone into trying to convince us that this Kalama project will reduce pollution and environmental impact. This looks misleading to me. I realize this is a very complex situation, with many global players and systems involved. Still, this does not seem to be a sustainable solution to current and future pollution mitigation. Future generations depend on us to be smarter than that. I do not support any use of public funds for this project, and I want private entities to be held truly accountable and thinking way, way smarter about the bigger picture of what is going on with global warming and pollution. This project looks to me like it actually has long-term, negative consequences and dangerous, harmful environmental impacts.

Deborah Hoskinson

I OPPOSE the development and operation of a natural gas-to-methanol production plant and storage facilities on approximately 90 acres at the Port of Kalama due to the impact it will have on orca whales, other whales, salmon and all Pacific NW marine life! Humans must value marine life and animal life on this planet as much as we value human life. Thank you for your serious consideration of this critical matter.

Kristine Bruckner

A summary of the global greenhouse gas situation states that the proposed Kalama methanol refinery WOULD increase greenhouse gasses in the state of Washington (particularly near the location of the methanol refinery), and COULD decrease greenhouse gasses globally. You are the agency that is charged with protecting the ecology of the State of Washington, and there are some grave risks associated with this wager.

1. In order for the argument in favor of the refinery to hold, current facilities overseas would need to either close or clean up their emissions. There is, however, no control built in to assure this would actually happen. The Kalama refinery could simply increase the production of methanol as the demand grows ever larger. There is actually no way to know or assure what the outcome would be. And there are not strong reasons for optimism.
2. There are few countries whose governments have a worse record of trustworthiness and keeping promises than China. There is a reason the US is concerned about TIKTOK, Huawei and other companies for lack of transparency. China is a very high risk partner in a business that endangers the local environment. Not only would the logic of this enterprise depend on closing of facilities abroad, but the refinery itself would be owned by, and largely run by Chinese nationals. There is no stake for them in the air and water, nor the health of the local population.
3. Please protect us. This refinery would certainly bring down the quality of the air in southwest Washington. Suffering through the hazardous smoke of a few weeks ago was a powerful and grim reminder of what diminished air quality does to breathing and the ability to live in a reasonably healthy manner. Find another way to lower global greenhouse gasses--not an idealistic vision that certainly diminishes or even sacrifices the health of the local population for a possible theoretical goal.

Wendy Emerson

When climate chaos is all around us and literally thick in the air in the form of smoke from wildfires worsened by global heating, it is amazing that this project has not been summarily canceled. What more evidence do people need to see the insanity of promoting projects such as this--that will continue to belch carbon pollution for 40 years--in a time when we should be phasing out existing plants instead of endeavoring to build new ones.

Don Steinke

How can you say you took a hard look at the projects impacts, when you subcontract that work to someone else who assumed the validity of the claims made by NWIW.

The DSSEIS attempts to predict the future ♦ and that prediction is pessimistic and just an assumption:

assuming China will not change its policy, no economic events, regulatory changes (such as China just announced) or technological breakthroughs will materially alter the way methanol is consumed or produced (such as in California with its new 50% recycled content law) during the next 40 years.

Continuing down our current trajectory of rampant fossil fuel consumption would be disastrous for our planet and civilization. NWIW shrugs and says: this "how the world actually works." That's fatalistic.

The DSSEIS' cynical guess about the next 40 years of human history does not constitute the "hard look" that SEPA requires. SEPA mandates a hard look at those impacts of a proposal that are reasonably foreseeable ♦ no less, and no more.

Jim Fisher

I am against approval of this project for the following reasons:

1. The draft EIS assumes that up to 40% of the methanol production could end up used as fuel in (China) and thereby produce substantially more greenhouse gases. However, previous presentations by NWIW for stockholders indicated that up to 95% or more of the production could be used for fuel. Given the demonstrated lack of credibility of the future owner, the Chinese Government, DOE's decisions should be based on worst-case scenarios for global greenhouse gas emissions from methanol produced by this project.

2. The draft EIS is misleading when trying to compare global market supply/demand scenarios and global greenhouse gas emissions with and without the subject project in place. This evaluation is highly speculative and based on far too general assumptions concerning how and where China might resource alternative methanol supplies other than Kalama. WDOE has no control or actual data on where or what such alternative sources might exist outside of WA state, and therefore should not attempt to base a decision on such speculation. However, WDOE should emphasize the worst-case potential of this project to create adverse greenhouse gases globally, irrespective of any other alternative sources, and any subjective mitigation of GHG emissions from unknown sources in the world.

3. As stated above, this project will be owned and directed by the Chinese Government, which has a reputation of being untrustworthy and manipulative in their business dealings with the U.S. and other countries. This makes all of the data and project information they have provided through NWIW and other sources under their control highly suspect. As such, WDOE should be extremely wary and conservative in their final judgement and decisions, and disapprove of this project.

Thank you for this opportunity to provide comments.

Jim Fisher, CPEA, CHMM

Katherine Nelson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Suzanne Thornton

Washington Department of Ecology

I am a 79 year old woman who lives in Portland Oregon. During this world wide pandemic we have more time to look closely at what is going on around us. Among many I live on this North American plate in the United States of America in the state of Oregon and in the region of the Northwest. So I am a citizen on many levels.

I understand the petroleum industry wants to use our Columbia River corridor as storage, refinery and transportation out to China and elsewhere.

Northwest Innovation Works, NWIW wants to build the world's largest refinery on the Columbia River in the town of Kalama. They will need to use millions of gallons of water connecting from the Columbia River every day.

Now I could stop here to object to this idea. It would be enough to stop this Kalama Methanol refinery construction.

But finding the company NWIW has not been forthcoming in meeting the Environmental Impact Statement, EIS standards set by the state of Washington is concerning. They have neglected to include the pollution of fracked gas in all of its stages in getting to the proposed refinery. The actual methanol refinery itself would cause millions of tons of greenhouse gas pollution every year of its production. How long do they expect the plant to run?

40 years is the proposal.

Is this the future we want to leave?

Please reject this Kalama methanol refinery project.

It is wrong on so many levels.

Sincerely,

Suzanne Thornton

10/5/2020

Dennis Colombo

When attempting to predict future global GHG emissions how about factoring in the displacement of some fossil fuel energy sources with clean energy sources such as solar and wind? I think that is a more likely scenario than the chances that China will replace coal with Kalama methanol and would probably result in Kalama adding a much greater share of GHG and other pollutants to the atmosphere. Therefore, I urge that the Dept. of Ecology deny this permit.

Montana Pulido

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

NJ Morgan

Today I write as not only a concerned citizen-voter, Pacific Northwest resident, and parent-grandparent - but also as a former educator.

Analyses and data show that this proposed project is neither financially wise nor environmentally solid.

Please - take the lead through clear rejection of the project, with thorough explanation to the public about the myriad drawbacks and questions.

Respectfully,
Nancy Morgan

Brian Garrison

Creation of plastics is one of the downstream products of the proposed methanol plant. The EIS does not account for the long-lasting and widespread environmental impacts of plastics.

Many plastics are embedded in products as one of many materials and not readily recyclable. Even when plastics could be easily recycled, rates are very low (30% in Europe, 9% in the US, see Scientific American article, "Solving Microplastic Pollution..." attached). Which means large quantities of the downstream products created from this methanol refinery would become part of the growing solid waste heaps.

Plastics made from fossil fuels do not readily break down. The resulting waste may sometimes degrade and crumble, but still continue to pollute as microplastics. These microplastics are a threat to human and animal health. The World Health Organization's (WHO) 2019 report, "Microplastics in freshwaters and drinking water: Critical review and assessment of data quality" (see attached) and the related information sheet (see attached) speak to the harms of microplastics. For example, "The potential hazards associated with microplastics come in three forms: physical particles, chemicals and microbial pathogens as part of biofilms." Though the facility offers hope through efficiency, We don't need efficient means of making plastics, we need materials that do not widely and permanently infest our clean water systems. For more on the effects to wildlife and humans, see the 2020 article from the International Journal of Environmental Research and Public Health and the other Scientific American article, "From Fish to Humans..." (attached).

Though it's possible to filter microplastics from water, we put human health at risk by becoming dependent on complex purification systems. Allowing plastics and microplastic pollution to proliferate also overlooks individuals and communities that do not have easy access to filtered water. Furthermore, the current systems in place are not keeping drinking water humans safe from microplastics. According to the same report, "Microplastics are ubiquitous in the environment and have been detected in a broad range of concentrations in marine water, wastewater, fresh water, food, air and drinking-water, both bottled and tap water." This EIS offers no means to mitigate the resulting pollution that would arise from the plastics manufactured using the facility's methanol.

To continue building infrastructure that pollutes in this manner is irresponsible and reckless. The plan for this facility fails to consider the impact on human health caused by the downstream plastic products. As a species, our survival depends on us making a hard transition away from "business as usual" and toward fundamentally different manufacturing systems. We cannot say that predicted demand is a sufficient reason to create supply, or we become trapped in a self-fulfilling prophecy. If you place a bowl of sugar in front of a baby, they will eat it (predicted demand causes the consumer to take the supply). If you teach responsible eating habits, then unhealthy behaviors and the appetite for sugar can be kept in check (demand for one product becomes demand for healthier alternatives).

By offering a readily available supply of plastic and the methanol that creates it, this facility enables business-as-usual, allows the continued pollution of our basic life-sustaining resources (water), and threatens human lives. I urge you to reject the proposed project.

ABSTRACT

Microplastics have recently been detected in drinking water as well as in drinking water sources. This presence has triggered discussions on possible implications for human health. However, there have been questions regarding the quality of these occurrence studies since there are no standard sampling, extraction and identification methods for microplastics. Accordingly, we assessed the quality of fifty studies researching microplastics in drinking water and in its major freshwater sources. This includes an assessment of microplastic occurrence data from river and lake water, groundwater, tap water and bottled drinking water. Studies of occurrence in wastewater were also reviewed. We review and propose best practices to sample, extract and detect microplastics and provide a quantitative quality assessment of studies reporting microplastic concentrations. Further, we summarize the findings related to microplastic concentrations, polymer types and particle shapes. Microplastics are frequently present in freshwaters and drinking water, and number concentrations spanned ten orders of magnitude (1×10^{-2} to $10^8 \text{ \#}/\text{m}^3$) across individual samples and water types. However, only four out of 50 studies received positive scores for all proposed quality criteria, implying there is a significant need to improve quality assurance of microplastic sampling and analysis in water samples. The order in globally detected polymers in these studies is $\text{PE} \approx \text{PP} > \text{PS} > \text{PVC} > \text{PET}$, which probably reflects the global plastic demand and a higher tendency for PVC and PET to settle as a result of their higher densities. Fragments, fibres, film, foam and pellets were the most frequently reported shapes. We conclude that more high quality data is needed on the occurrence of microplastics in drinking water, to better understand potential exposure and to inform human health risk assessments.

1. Introduction

Microplastics are generally characterised as water-insoluble, solid polymer particles that are ≤ 5 mm in size (Bergmann et al., 2015). A formal definition for the lower size boundary does not exist, but particles below $1\ \mu\text{m}$ are usually referred to as nanoplastics rather than microplastic (Koelmans et al., 2015). Although microplastics are often detected in the environment, the risks they pose are debated and largely unknown. One key challenge in assessing the risks of microplastics to humans and the environment relates to the variability of the physical and chemical properties, composition and concentration of the particles. Further, microplastics in the environment are difficult to identify and standardized methods do not exist (Mintenig et al., 2018). The dominant source of microplastics often is the fragmentation of larger plastics or product wear, however the rate of fragmentation under natural conditions is unknown (Eerkes-Medrano and Thompson, 2018). These challenges and unknowns hamper the prospective assessment of exposure and risk (Koelmans et al., 2017). In this uncertain field, regulatory efforts to examine microplastic safety have been raised (SAM, 2018a, b).

The presence of microplastics has been reported for air samples, food and drinking water (EFSA, 2016; Gasperi et al., 2018; Lusher et al., 2017; Van Cauwenberghe and Janssen, 2014; Wright and Kelly, 2017; Yang et al., 2015) and recently, the implications of microplastics for human health have been reviewed (Wright and Kelly, 2017). Although microplastic exposure via ingestion or inhalation could occur, the human health effects are still unknown. If inhaled or ingested, limited data from animal studies suggest that microplastics may accumulate and cause particle toxicity by inducing an immune response (Deng et al., 2017; Gasperi et al., 2018). Chemical toxicity could occur due to leaching of plastic-associated chemicals (additives as well as adsorbed toxins) (Diepens and Koelmans, 2018; SAPEA, 2019). Such effects are likely to be dose-dependent, however knowledge of exposure levels is currently lacking. Furthermore, biofilms growing on microplastics may be a source of microbial pathogens (GESAMP, 2016). Hence, although there are potential chemical, particle and microbial hazards associated with microplastics, current exposure levels, including through drinking water need to be assessed first.

The ubiquity of microplastics of all sizes in surface water, groundwater and wastewater (SAPEA, 2019), has raised the question if pollution of drinking water occurs. To date, there is only a limited number of studies that address this issue and they indeed reported the presence of microplastics in tap water and bottled water (Kosuth et al., 2018; Mason et al., 2018; Mintenig et al., 2019b; Schymanski et al., 2018). Some of these studies triggered a great deal of attention in the scientific community as well as the media, putting the issue of human exposure to microplastics via drinking water high on the agenda of public health agencies worldwide. More broadly, ensuring safe drinking water is high on the political agenda, with a dedicated target on safe and affordable drinking water under the Sustainable Development Goals (SDG 6) (WHO and UNICEF, 2017).

To date, about 50 studies exist that provide concentration data for microplastics in drinking water or its freshwater sources, i.e., surface water and groundwater, as well as (indirectly) wastewater. These studies provide data for specific types of water, but methods of sampling, isolating, purifying and identifying microplastics vary enormously among studies. A systematic review of methodologies used and study characteristics is currently lacking. There are several scoping reviews that emphasise the relevance of microplastics in freshwaters (Eerkes-Medrano and Thompson, 2018; Li et al., 2018; Wagner et al., 2014) or that specifically discuss processes or models in freshwaters (Kooi et al., 2018). We are aware of only a limited number of reviews that touch upon methodologies and concentration data (Eerkes-Medrano and Thompson, 2018; Li et al., 2018).

Besides variation in methodologies used and concentrations reported, existing studies are likely to vary with respect to the level of quality assurance deployed. The quality of microplastic research has been debated recently (Burton, 2017; Connors et al., 2017; Koelmans et al., 2016) and has been quantitatively assessed for studies on microplastic ingestion by biota (Hermesen et al., 2018). However, a critical review of studies reporting concentration data in freshwater and drinking water, which also evaluates the quality of applied sampling methods, microplastic extraction and identification steps, is currently lacking.

For chemical risk assessments in a regulatory context, quality criteria have been set in order to be able to evaluate the reliability of data from toxicological studies (Kase et al., 2016; Klimisch et al.,

1997; Schneider et al., 2009). Such criteria contribute to the harmonization of the hazard and risk assessments of chemicals across different regulatory frameworks. Recently, Hermesen et al. proposed a weight-of-evidence scoring method for studies of microplastic ingestion by marine biota (Hermesen et al., 2018). This method defined minimum quality criteria for various aspects of the analytical procedure, such as sampling, sample treatment, use of controls and polymer identification. It assigns a score for each aspect and provides a total reliability score for data reported in a study. Such a method can also be developed for the analysis of microplastics in freshwater samples, and can be applied to quantify the relative reliability of reported concentration data.

The aim of the present paper is to critically review the available literature on microplastics in drinking water and its freshwater sources, from a quality assurance perspective and by using a quantitative approach. Wastewater studies were also assessed as these are discharged into the environment. Further aims are to review data on concentration, polymer type, shape and size distribution data across studies. Guidance is provided to improve the quality of future occurrence studies.

Our paper is organised as follows. We first present the key areas that should be assessed to determine the reliability of studies. These areas are presented in separate sections and are: sampling method, sample size, sample processing and storage, laboratory preparation and clean air conditions, negative controls, positive controls, sample treatment and polymer identification. For each of these areas we discuss quality assurance aspects, considerations for scoring, and present the assessment scores for each of these criteria. Subsequently, the combined overall reliability scores are discussed, followed by a discussion on implications for human health risk assessments. In the section thereafter we discuss the outcomes of the reviewed studies. An overview of the concentrations, shapes and polymer types measured is provided and trends are discussed with respect to sample type, location or system characteristics. Finally, we provide recommendations to improve the analysis of microplastics in water samples and summarize the key conclusions.

2. Methods

2.1. Literature search

Fifty-five records from fifty studies reporting microplastic concentrations in drinking water (2 tap, 3 bottled water) or its freshwater sources (1 groundwater, 30 surface water, 18 wastewater) were reviewed. Some studies reported data on microplastics in more than one water type. Most papers were retrieved from the Scopus database. Search strings used were *microplastic AND (bottle OR surface OR tap OR wastewater OR groundwater)*. Three studies were from the grey i.e. not peer-reviewed literature and were found via Google searches, using the same or similar key word combinations. Searches were performed until August 2018. Only those studies that reported original concentration data were reviewed.

2.2. Quantitative quality assessment

The reliability of data in studies was evaluated based on criteria originally developed for microplastic in biota samples by Hermesen et al. (2018), and surface water samples by Mintenig et al. (2019a, in prep.). The present approach further refines the method to different categories of water samples, including tap or bottled drinking water, surface water, groundwater and wastewater. The method uses nine crucial criteria, which are detailed below. Criteria relate to those that are common in analytical chemistry, such as reproducibility of described methods, precision, accuracy and sensitivity,

which together determine the robustness of an applied method. Reproducibility does not imply that another researcher would obtain the same result, which is due to the variability in conditions inherent to nature. Reproducibility in the context of analytical chemistry refers to minimizing the contribution of random or systematic error to the total observed variability. For each criterion a value of 2 (reliable), 1 (reliable to a limited extent) or 0 (unreliable) is assigned. A 'Total Accumulated Score' (TAS) is calculated by adding scores for individual criteria (maximum 18 points) (Tables 1, S2, S3). For data to be considered sufficiently reliable, a study should preferably have no 'zero' values for any of the individual scores (Hermesen et al., 2018).

2.3. Study characteristics

For each study the following characteristics were summarized in tabular form (Table S1): Reference, Country (area), Source (water type), Treatment applied (for wastewater treatment plants (WWTP) or drinking water treatment plants (DWTP), bottled and tap water), Sampling date, Size/shape (of microplastics detected), Polymer types (of microplastics detected), Chemicals (analysed on microplastic), Value (of microplastics detected in water sample), Quality assurance applied (detection limit, positive controls, negative controls), Sampling method, Analysis method, Comments. Raw concentration data were pooled per water type: WWTP influent, WWTP effluent, lake, river, canal, groundwater, untreated and treated tap water, and bottled water, and analysed for means, ranges and significance of differences among the water types. As data were not normally distributed, the differences were assessed with the Mann-Whitney-Wilcoxon test with Bonferroni correction.

3. Results and discussion

3.1. Quality assessment of studies reporting data on microplastics in water samples

In this section, methodological aspects are reviewed in subsections and the final total quality scores are presented and discussed. Following Hermesen et al. (2018), for each aspect, scoring criteria are provided and each criterion is explained and justified (Table S2). Such a score based, quantitative evaluation does not result in an absolute judgment but is an indicator of the reliability of these studies for monitoring purposes and to inform risk assessments of microplastics in the drinking water supply chain. The quality criteria provided here are considered adequate for the present assessment, yet may develop over time with increased experience in sampling and analysing microplastics and better understanding of global concentrations. Here we review the general trends; for details on specific studies the reader is referred to Tables S1 and S3.

3.1.1. Sampling methods

Sampling methods were reviewed to understand the variety of approaches utilized, to assess whether sampling was described in sufficient detail, and to be able to define quality assessment criteria for sampling (Tables S1 and S2). Surface water is sampled by pumping, trawling or filling bottles or buckets, followed by sieving to isolate particles of the desired size range (Table S1) (Li et al., 2018). For wastewater, samples are either grabbed with bottles, pumped directly or collected with automatic composite samplers, then sieved, whereas tap and bottled water are directly sieved. Residues in nets or sieves are typically flushed into glass or metal jars or bottles. To obtain a maximum score of 2, the date, location and materials used should be reported. Specific further criteria were defined for wastewater, surface water, untreated and treated

tap water and bottled water. For wastewater, the applied treatment type should be mentioned as this can impact the microplastic concentrations and should be considered when assessing retention or removal efficiencies of individual technologies. For the same reason, this should be done when taking samples on DWTPs. For surface water, the depth of sampling should be reported, as this may affect concentration (Kooi et al., 2018). For tap water, when the aim is to assess concentration in general, running the tap before sampling is recommended (e.g. 1 min) in order to avoid incidental contamination from air (Wesch et al., 2017), unless it is specifically mentioned that the aim is to measure the first portion of the water, e.g., the first glass. Furthermore, flowrate and source of tap water (e.g., storage tank, groundwater, surface water) should be reported, as this may be relevant for data interpretation. For the same reason, for bottled drinking water, the source, batch production lot and bottled water type (sparkling vs still water) should be specified. To maximize particle recovery from the bottle, the sample should be shaken before filtration and the emptied bottle should be flushed three times with filtered water. A score of 1 was assigned if a study provided a subset of the required characteristics (e.g. date, location), but is still fairly reproducible. About half of the studies score 2 on this criterion whereas only three studies score 0.

3.1.2. Sample size

Different factors were considered when recommending an optimum water volume to be sampled. For microplastics, the limit of detection can be seen as the methods' capability of reliably detecting at least one particle with statistical rigor. A sample volume that is too low reduces the chance of finding particles, reduces the power of a study and increases the margin of error. This means that detection limits benefit from large sample volumes. Similar approaches i.e. sufficient sample size are used when analysing chemicals in environmental matrices (Einax et al., 2004). However, for samples with particles, samples should be small enough to prevent clogging of filters or sieves. This means that recommendations for sample sizes will differ for different water types. Because the actual concentration cannot be predicted, occurrence of non-detects or filter clogging can never be fully prevented.

Detection limits also depend on the particle size range aimed for in a study. Various studies have shown that smaller particles are more abundant (Cabernard et al., 2018), implying that smaller sample volumes are required when exclusively examining small microplastics that are analytically challenging to detect (e.g., <100–300 μm). However, if such a study would also aim to detect larger microplastics accurately, a large volume would still be required. Establishing sample volume recommendations for studies primarily aiming for larger (roughly > 300 μm) microplastics, should consider both expected microplastic concentrations for a given water type and practical considerations. Most studies reviewed belong to this category that aimed to detect also larger microplastics. In surface water, > 300 μm microplastic concentrations span a wide range of concentrations; roughly 1×10^{-3} to 10 particles per litre (Fig. 1). Because of the low concentrations and ease of obtaining large volumes from surface waters, we set 500 L as a minimum sample volume for surface water. However, given the often very low particle number concentrations in some lakes and rivers, a volume greater than 500 L is recommended for remote locations.

For tap water (range 1×10^{-4} to 100 particles per litre), a greater sample volume is proposed compared to surface water. We advise a minimum volume of 1000 L, because of the concentrations that can be very low (Mintenig et al., 2019b), uncertainties with the representativeness of this range given the low number of studies identified, and ease of sample collection. For bottled water, there were also a limited number of studies available. Yet they all demonstrate presence of at least several particles per litre, such that even a

minimum of 1 L would be defensible in case a 1 L bottle would be the study unit and only very small particles (<100 μm) would be targeted. However, the study unit in such studies is often the brand or production lot, and also larger particles are targeted, in which case we recommend to sample >10 L for a more representative result. As bottled water usually is provided in volumes smaller than 10 L, this would imply the need to either analyse multiple bottles or to treat the total volume of multiple bottles as one sample. For WWTP influents where concentrations of particles are expected to be higher (Fig. 1), a sample volume of 1 L is considered sufficient. For WWTP effluent, a sample volume greater than 500 L is recommended, or a reported clogging of the sieve e.g. (Carr et al., 2016; Mintenig et al., 2017; Vollertsen and Hansen, 2017; Ziajahromi et al., 2017). These volumes mentioned would lead to roughly 5 to 500 particles detected, which is considered sufficiently representative if the detection limit would be 1 particle as mentioned above. Use of these volumes would receive a maximum score of 2. However in some cases lower volumes have been used with good reason and may still yield fair results. In these cases a score of 1 is assigned (Table S2). Studies that explicitly aim for only smaller particles can use smaller volumes as long as detection limits are met, and still receive the maximum score.

3.1.3. Sample processing and storage

For the transfer of a primary sample (e.g. material in a net or sieve) to a storage bottle, or for preservation or storage of samples before reaching the laboratory, certain criteria need to be met. Some studies rinse jars, bottles or other materials with targeted water e.g. (Kosuth et al., 2018; Talvitie et al., 2015). However, particles from that rinsing water could easily stick to surfaces and remain, which thus would lead to contamination of the actual sample. Ideally, sample containers should be rinsed in the laboratory with filtered water before bringing them to the field. In general, samples should be stored shortly after sampling and further handling avoided before arriving in the laboratory. When sampling, use of plastic materials should be avoided as much as possible to again minimize contamination. Many studies use a fixative like ethanol, formalin or methyl aldehyde (Anderson et al., 2017; Baldwin et al., 2016; Eriksen et al., 2013; Fischer et al., 2016; Mason et al., 2016a; Su et al., 2016; Wang et al., 2018; Xiong et al., 2018; Zhang et al. 2015, 2017). However, the effects of the fixative on different types of plastic should be evaluated before application, or studies should report evidence from the literature (Hermesen et al., 2018). Ethanol and formalin for instance, have been shown not to affect polymer characteristics (Courten-Jones et al., 2017). Some of the studies reviewed here used volunteers for sampling and sample processing (Christiansen, 2018; Kosuth et al., 2018). Citizen science (CS) approaches have been used in environmental monitoring and are increasingly being used in research on plastic debris (Liboiron et al., 2016; Syberg et al., 2018). It has been argued that this may improve risk perception within society and therefore improve the foundation for timely and efficient societal measures (Syberg et al., 2018). There is also an economic incentive to collect data with volunteers rather than by paid professionals, and some monitoring research would even be impracticable if data were not collected by volunteers (Brett, 2017). However, concerns with respect to the quality of CS have been raised, and validation studies have shown that the reliability of CS based data is highly uncertain (Brett, 2017). Other than for macroplastics, quality assurance for sampling and sample processing of microplastics is technically demanding and the error rate can be expected to be higher for volunteers than for professionals. Since no CS validation studies for microplastics sampling and analysis exist to date, it is not clear to what extent the quality of data is affected by having some of the crucial steps performed by non-professionals. Therefore, as scientific quality

Fig. 1. Box and whisker plot showing median and variation in microplastic number concentrations in individual samples taken from different water types. Data relate to individual samples unless only means were reported, in which case the mean value was taken into account n times, with n being the number of samples which the mean was based on. References included: (Estahbanati and Fahrenfeld, 2016; Faure et al., 2015; Fischer et al., 2016; Hoellein et al., 2017; Kosuth et al., 2018; Leslie et al., 2017; Magnusson and Norén, 2014; Mason et al. 2016a, 2018; McCormick et al. 2014, 2016; Michielssen et al., 2016; Mintenig et al., 2019b; Oßmann et al., 2018; Pivokonsky et al., 2018; Rodrigues et al., 2018; Schymanski et al., 2018; Simon et al., 2018; Talvitie et al. 2015, 2017a, 2017b; Vollertsen and Hansen, 2017; Wang et al. 2017, 2018; Ziajahromi et al., 2017), with $n = 27$. For statistical significances of differences among water types, see Table S4.

assurance is the primary perspective of this paper, use of volunteers for major parts of the sampling work was considered less reliable, leading to a score of 1 in case of validation of the adequacy of the protocols, and 0 in all other cases for this criterion.

3.1.4. Laboratory preparation

Contamination of samples due to airborne polymer particles and fibres has been described as a major problem in microplastic analysis (Hermesen et al. 2017, 2018; Torre et al., 2016; Vandermeersch et al., 2015; Wesch et al., 2016). Therefore, to avoid contamination and prior to actual sample preparation and analysis, certain measures need to be taken. These include avoiding synthetic components in clothing, wearing of cotton lab coats, and pre-rinsing and cleaning of all materials used as well as laboratory (bench, laminar flow cabinet) surfaces. If precautions were not fully reported but sufficient blanks (i.e., three blanks, see section 'negative controls' below) were included to keep track of background contamination, then a score of 1 was assigned (Table S2).

3.1.5. Clean air conditions

To avoid contamination with airborne microplastic particles or fibres, sample handling should be performed in a laminar flow cabinet or in a clean air laboratory to receive the maximum score (Hermesen et al., 2018). Recent studies are increasingly using such conditions (Mason et al., 2018; Oßmann et al., 2018; Schymanski et al., 2018; Wang et al., 2018; Zhang et al., 2017). In case clean air conditions were not used but covering of samples and sufficient blanks were reported, a score of 1 was assigned (Cable et al., 2017; Dris et al. 2015, 2018b; Miller et al., 2017; Mintenig et al., 2019b; Pivokonsky et al., 2018).

3.1.6. Negative controls

To verify and correct for contamination or to demonstrate absence of contamination, replicated ($n \geq 3$) procedural blanks

need to be analysed. All reviewed studies reported particles counts; if the variability of contamination was quantified, and if it was clearly indicated that actual sample results were corrected for blank values, a score of 2 was assigned. Some precautions are less reliable but still provide some useful information on the level of contamination, like the filtration of air, or the sole examination of petri dishes/soaked papers placed next to the samples (Cable et al., 2017; Dris et al. 2015, 2018b; Estahbanati and Fahrenfeld, 2016; Hendrickson et al., 2018; Lares et al., 2018; Mani et al., 2015; McCormick et al., 2016; Rodrigues et al., 2018; Simon et al., 2018; Ziajahromi et al., 2017). If these precautions were taken, a score of 1 was assigned.

3.1.7. Positive controls

Losses of particles may occur during various steps of sampling, sample preparation and analysis and it is recommended to quantify losses using positive controls. Estahbanati and Fahrenfeld (2016) assessed particle losses during sampling with nets, by adding plastic particles in distilled water. Subsequent sample handling in the laboratory often includes complex steps to remove organic matter from samples (see 'sample treatment' below), particularly from WWTP influent or effluent or surface waters. To verify a sufficiently high recovery of particles during filtration, digestion, transfer and analytical identification steps, representative replicated positive controls ($n \geq 3$) should be performed (Hermesen et al., 2018). If recoveries are low yet reproducible, the reported counts should be corrected for this incomplete recovery. Positive controls should be conducted for the targeted microplastics, covering different size classes and polymer types. Microplastic sizes span a wide range and it cannot be assumed that recoveries are constant across the range of sizes and polymer types. In practice, it is important to at least use small enough microplastics as controls, as these are more difficult to recover. In some cases, larger microplastics still require separate controls, especially when different

methods are applied. For instance, the method used by [Mason et al. \(2018\)](#) for particles smaller than 100 μm was different from that for particles larger than 100 μm , whereas positive controls were only performed for the smaller particles. Only three studies provided full data on positive controls ([Simon et al., 2018](#); [Vollertsen and Hansen, 2017](#); [Wang et al., 2018](#)) and received maximum scores, indicating that it is not yet a very common practice. Other studies conducted positive controls but with no or insufficient replicates ([Di and Wang, 2018](#); [Dyachenko et al., 2017](#); [Hendrickson et al., 2018](#)), or only for one step in the analysis ([Rodrigues et al., 2018](#)), or for part of the targeted size range ([Mason et al., 2018](#)) and received a score of 1.

3.1.8. Sample treatment

To assure the quality of visual inspection and subsequent polymer identification, which is especially critical for $<300\ \mu\text{m}$ particles and to enable the usage of more advanced identification techniques (see section ‘polymer identification’), a sample digestion step should be performed for surface and WWTP water samples in order to score 2 points. Tap and bottled water do not require a digestion step and thus were always assigned 2 points on this criterion. Digestion should be done under conditions that do not affect the microplastics weights, counts or shapes. In the context of biota analysis, use of potassium hydroxide (KOH) or enzymes has been demonstrated to be acceptable ([Catarino et al., 2016](#); [Cole et al., 2014](#); [Kühn et al., 2017](#); [Munno et al., 2018](#)). The reviewed studies here commonly used hydrogen peroxide (H_2O_2) which is known to affect some polymers ([Hurley et al., 2018](#)). However its effects have been demonstrated to be minimal within an exposure of 48 h ([Löder et al., 2017](#)) and was therefore deemed acceptable. Several studies kept the temperature around 35–45 °C, e.g. by using a cooling or ice bath ([Simon et al., 2018](#)), however sometimes higher temperatures up to 75 °C ([Anderson et al., 2017](#); [Baldwin et al., 2016](#); [Estahbanati and Fahrenfeld, 2016](#); [Hendrickson et al., 2018](#); [Hoellein et al., 2017](#); [Pivokonsky et al., 2018](#)) or even 80 °C were used in some of the digestion steps ([Vermaire et al., 2017](#)), or even 90 °C for drying ([Estahbanati and Fahrenfeld, 2016](#); [Hendrickson et al., 2018](#); [Ziajahromi et al., 2017](#)). Effects of temperature in combination with various digestion chemicals were studied by [Munno et al. \(2018\)](#). Based on comparison of data on polymer mass losses during heating and digestion, the authors concluded it was best to stay below 60 °C. We set 50 °C as the safe upper limit, and as a criterion to assign a maximum score as a precautionary measure and since many of the reviewed studies were below 50 °C. Digestion without such considerations of mass losses was assigned a score of 1. A score of 1 was also assigned for surface water when it was reported to be very clear and clean even without digestion applied. Furthermore, studies that did not apply digestion but explicitly were aiming for the detection of $\geq 300\ \mu\text{m}$ particles only, were assigned a score of 1 ([Hermesen et al., 2018](#)).

3.1.9. Polymer identification

To assure reliable assessment of plastic particles, the polymer identity needs to be confirmed, preferably by using (micro) FTIR or Raman spectroscopy, pyrolysis-GCMS or TGA-GCMS techniques ([Hermesen et al., 2018](#); [Löder and Gerdt, 2015](#); [Mintenig et al., 2018](#)). Although subsampling should be avoided, these techniques are so laborious that representative sub-sampling is often required. Best practice for subsampling and subsequent polymer identification will differ for different microplastic size classes and technologies applied ([Mintenig et al., 2018](#)). The manual sorting and subsequent identification of microplastics has a bias compared to the identification of particles enriched on filters with FTIR or Raman microscopy (i.e., avoid missing transparent or small particles), and is therefore discouraged when analysing particles

$<300\ \mu\text{m}$. For manually sorted particles, following [Hermesen et al. \(2018\)](#), we argue that analysis of all particles is feasible and therefore recommended if the numbers of pre-sorted particles *per study* are <100 . For particle numbers >100 , 50% should be identified, with a minimum of 100 particles. If polymer identities are reported on a *per sample* basis, we also advise to analyse all particles found, however with a minimum of 50. This minimum is considered reasonable to represent the variety of particle shapes and polymer types in environmental samples. Anyway, for such hand-picked representative subsets, studies generally still should describe how representativeness was assured. For smaller microplastics and when applying FTIR or Raman microscopy, the representativeness of subsampling (the area of a filter that was measured) is relatively easy to assess. Particularly when coupling a focal plane array detector to the microscope, many more particles (especially the small and transparent particles) can be assessed in one analysis. Although measurement times can be long, at least 25% of the filter needs to be analysed ([Mintenig et al., 2017](#); [Redondo-Hasselerharm et al., 2018](#)). If these criteria for number of particles and/or percentage of the filter are met, a score of 2 is assigned. If polymers were identified for a too low number of particles or on a smaller part of the filter, a score of 1 was assigned. Also, if SEM-EDS or -EDX was applied to distinguish polymers from non-polymeric materials ([Anderson et al., 2017](#); [Cable et al., 2017](#); [Mason et al., 2016b](#); [Su et al., 2016](#)), a score of 1 was assigned.

3.1.10. Overall reliability of method aspects and studies

For each study, we assessed against all quality criteria and calculated a total accumulated score (TAS) (Table S3). Whereas the maximum achievable TAS score is 18, average (min – max) TAS scores were 13.7 (13–14) for bottled water, 11.5 (8–15) for treated tap water, 12.5 (11–14) for DWTP water, 7.9 (4–15) for surface water, and 7.3 (3–13) for waste water studies, respectively (Table 1). This ranking in average scores for the different water types probably reflects the relative ease of analysing these different water types. For instance, bottled and tap water require no digestion, which means that 2 points were always assigned to the sample digestion criteria. It should be noted though that the number of studies examining DWTP and treated tap water (each $n = 2$), and bottled water studies ($n = 3$) was very low, rendering the averages to be less rigorous. On average, studies were assigned roughly half (8.41/18) of the maximum score for data quality, a result which is very similar to the average score assigned to studies reporting data on ingestion of microplastic by biota ([Hermesen et al., 2018](#)).

Only four studies received non-zero scores for all criteria. These were the study on surface water by ([Wang et al. 2018](#)) (TAS = 15), the study on bottled water by [Mason et al. \(2018\)](#) (TAS = 14), and two studies on wastewater by [Ziajahromi et al. \(2017\)](#) (TAS = 12) and [Hendrickson et al. \(2018\)](#) (TAS = 11). For the ranking of such non-zero studies, a multiplied score X can be calculated ([Hermesen et al., 2018](#)), followed by a $^2\text{Log X}$ transformation in order to obtain a linear scale for a maximum score of 9. This would lead to a score of 6 for the data provided by [Wang et al. \(2018\)](#), a score of 5 for the data provided by [Mason et al. \(2018\)](#), a score of 3 by [Ziajahromi et al. \(2017\)](#), and a score of 2 for the data provided by [Hendrickson et al. \(2018\)](#). These four studies were published in the years 2017 or 2018, which may reflect recent progress in the quality of applied methods to analyse microplastics in environmental samples. With only four studies having all non-zero scores, it can be concluded that the majority of the reviewed studies (46 studies or 92%) cannot be considered fully complete or reliable on at least one crucial aspect of quality assurance. This does not mean that studies may not be useable or important as a more specific consideration of scores and study outcomes in hindsight, can still make a study very well fit for certain research questions.

Table 1Overview of individual and accumulated scores^a of papers reporting microplastic concentrations in surface water and drinking water.

Author	Type	Sampling methods	Sample size	Sample processing and storage	Lab preparation	Clean air conditions	Negative controls	Positive controls	Sample treatment	Polymer ID	Total Accumulated Score ^b (TAS, max = 18)

^a For the scoring criteria, the reader is referred to Table S2.

^b TAS values are underlined when all underlying scores are non-zero.

Besides insights in methodological differences among individual studies, the scores allow for a cross comparison of reliability differences per criterion (Table 1) (Hermesen et al., 2018). Average scores per criterion were all lower than 2, which means there is room for improvement of quality assurance in this field of research. The average scores per criterion across 55 records were lower than 1 for the criteria *sample treatment* (0.93), *polymer identification* (0.89), *laboratory preparation* (0.77), *clean air conditions* (0.64), and *positive controls* (0.21). Therefore, significant improvements are needed especially for these five out of nine quality aspects. Our analysis further illustrates that besides actual quality assurance, also full reportage of method details is important, to assure traceability and reproducibility of data. Reporting is a quality aspect in itself and some studies may have scored higher had they been reported better. In this respect we recommend to also include detection limits in terms of number and mass concentrations, but also in terms of minimum and maximum detectable particles sizes inherent to the applied methodology.

3.1.11. Implications of quality criteria and reliability of studies for human health risk assessment

Human health risks depend on exposure and it is well known that drinking water is an uptake pathway for microplastics. Consequently, quality in the analysis of microplastics in drinking water and its sources is very relevant to accurately assess risks to human health.

In this respect it should be mentioned that the proposed criteria are related to concentrations in the water, which however may not fully correlate with exposure. For instance, we recommended running the tap before sampling to avoid contamination of the first portion of water, to assure reproducibility of results and further, because many consumers would do this anyway. However, others may not do this and addressing this variability may be relevant for exposure assessment. Exposure to microplastics may also depend on the level of shaking of a bottle before drinking, whereas our criteria recommend shaking in order to maximize the chance that all particles are measured, and to assure reproducibility of the analysis. Exposure in drinking water can additionally be influenced by direct contamination of drinking water through contact with air, but to better understand contamination that is coming directly from the water supply and to support comparability and reproducibility, we recommend procedures to prevent airborne contamination. Finally, exposure to microplastics would also include uptake via inhalation or food (Wright and Kelly, 2017), which is not covered in this paper that only addresses drinking water and its sources.

The fact that high quality data are limited also has implications for human health risk assessment, which considers both exposure as well as health effects. Only four out of 50 studies (which were published in 2017 and 2018) were of such a level of reliability (i.e. having no zero scores) that they could be used confidently for an exposure assessment. Importantly, of these four studies, the recent study on microplastic particles in bottled drinking water (Mason

et al., 2018) would be highly relevant for human health risk assessment, based on the criteria used here, although the study only had maximum scores in 5 out of 9 criteria. Therefore, this uncertainty in the overall exposure data precludes the ability to conduct a robust risk assessment, whether related to particle toxicity, chemical toxicity or microbial toxicity. We therefore conclude that more high quality data is needed on the occurrence of microplastics in drinking water to more confidently assess potential exposure, as a critical piece for understanding the potential human health risks.

3.2. Microplastics in freshwater

3.2.1. Global microplastic concentrations in different water types

We reviewed the available literature on microplastics in drinking water, fresh water and wastewater. Monitoring has been conducted in multiple locations in Asia, Australia, Europe and North America. A selection of studies reporting particle number concentrations were used for a further analysis (Figs. 1 and 4), if they reported means and/or raw data on a volume basis. These microplastic concentrations, reported as number of particles, spanned ten orders of magnitude (1×10^{-2} to 10^8 #/m³) across all individual samples and water types, also when excluding wastewaters (Fig. 1). The number of microplastic particles in samples per water type was statistically different ($p < 0.05$) for all pairwise comparisons of water types, except for the comparisons between ground water and all other water types, WWTP effluent versus (untreated) DWTP and tap water, and WWTP influent versus (untreated) DWTP water (Fig. 1, Table S4). As these concentration data relate to numbers, they do not distinguish between particle size, shape or material type; differences that will be discussed in the sections below. Studies often do not mention a lower nor an upper size limit, or only mention the targeted size class. The data include particles reported as microplastics, that is, we did not take out suspect non-polymer particles as identified either by authors themselves or based on our quality assessment discussed above. The range for 50% of the data per water type (the boxes in Fig. 1) is 1–2 orders of magnitude, and quite similar for influent, effluent, lake, river and bottled water data. For canal and tap water only a few studies were available, which may have caused the variation to be much smaller. For bottled water, the number of studies was also low (Mason et al., 2018; Oßmann et al., 2018; Schymanski et al., 2018), however there were many samples (bottled water brands) for this water type available in these studies. The median concentrations per water type vary over four orders of magnitude.

Some general patterns exist in the concentration data (Fig. 1). Surface waters have the lowest concentrations of all water types, with, bottled water closer to the higher end. The lower concentrations observed in surface water, particularly compared to drinking water, is likely attributed to the fact that most surface water studies targeted only larger particles whereas smaller particles are more abundant (Cabernard et al., 2018). WWTP influent shows the highest concentrations based on the median and

interquartile range of reported concentrations (Fig. 1) although WWTP studies generally did not monitor small particles. The high concentrations therefore reflect direct domestic inputs and inputs from those diffuse land-based sources that are routed via waste water. WWTP effluent has a lower median compared to WWTP

influent, which probably reflects the retention of microplastics in WWTPs. Similarly, untreated tap water has higher concentrations than treated tap water. Concentrations in bottled water are higher than in tap water, which may reflect the higher influx of airborne particles in the factories, which are inherently more locked in, wear

Fig. 2. Number of studies reporting a particular shape of microplastic particles (from a total of 55 records).

Fig. 3. Number of studies reporting a particular polymer type of microplastic particles (32 out of 55 records reported polymer type).

from caps or bottle walls after production, or the fact that these studies also included smaller sized particles. For instance, Schymanski et al. (2018) used Raman microscopy and was thus able to identify down to $> 5 \mu\text{m}$, which also explains the high number concentrations. The general trends observed here (Fig. 1) still remain when only the studies that received highest quality scores are taken into account (Fig. S1). Still, the generalities listed here should be interpreted with caution given the low number of bottled water ($n=3$), treated tap water ($n=2$), (untreated) DWTP water ($n=2$) and ground water studies (1), although as noted earlier, there were many bottled water samples available in the limited number of studies.

3.2.2. Microplastic shapes in global freshwaters

Microplastics of different shapes were reported. Several factors limit a potential quantitative analysis of reported data on the relative abundance of shapes among water types. First, many studies typically only analysed shapes of a subset of all isolated particles and it is not clear how representative these subsets were when it comes to particle shape. Second, studies targeted different size ranges which also limits their comparability. For instance, fibres are typically small (Cole, 2016), so easily missed when trawling. Third, studies differed in the extent their water samples were representative of the studied water systems or water type, which in

turn is affected by spatial and temporal variability. Fourth, although some particles' shapes were quite well-defined and thus interpreted similarly across studies, some others are more ambiguous, like nurdle, pellet, pre-production pellet, sphere, resin or granule. Nevertheless, we can provide a relatively robust view of the relative importance of particle shapes by showing the frequency of shapes observed across studies (Fig. 2). The reviewed studies ($n=50$) reported (in the order of decreasing reporting frequency): fragment, fibre, film, foam, pellet, sphere, line, bead, flake, sheet, granule, paint, foil and nurdle (Fig. 2). We argue that this order also reflects a relative order of importance of shapes, that is, the most frequent shapes detected in a high number of locations globally, as the reviewed studies concerned many different locations on the globe.

3.2.3. Polymer types reported in global studies on freshwater microplastics

For 32 out of 55 records, polymer types were assessed. Similar to particle shape as discussed above, and rather than discussing relative abundances per study, we consider the relative frequency of reported polymer types observed in water types on a global level. Often, relative abundances per study are not provided, or may not be considered accurate due to limited or biased subsets of particles used for the polymer identification. Most frequently observed polymer types across studies and records are $\text{PE} \approx \text{PP} > \text{PS} > \text{PVC} > \text{PET}$, with

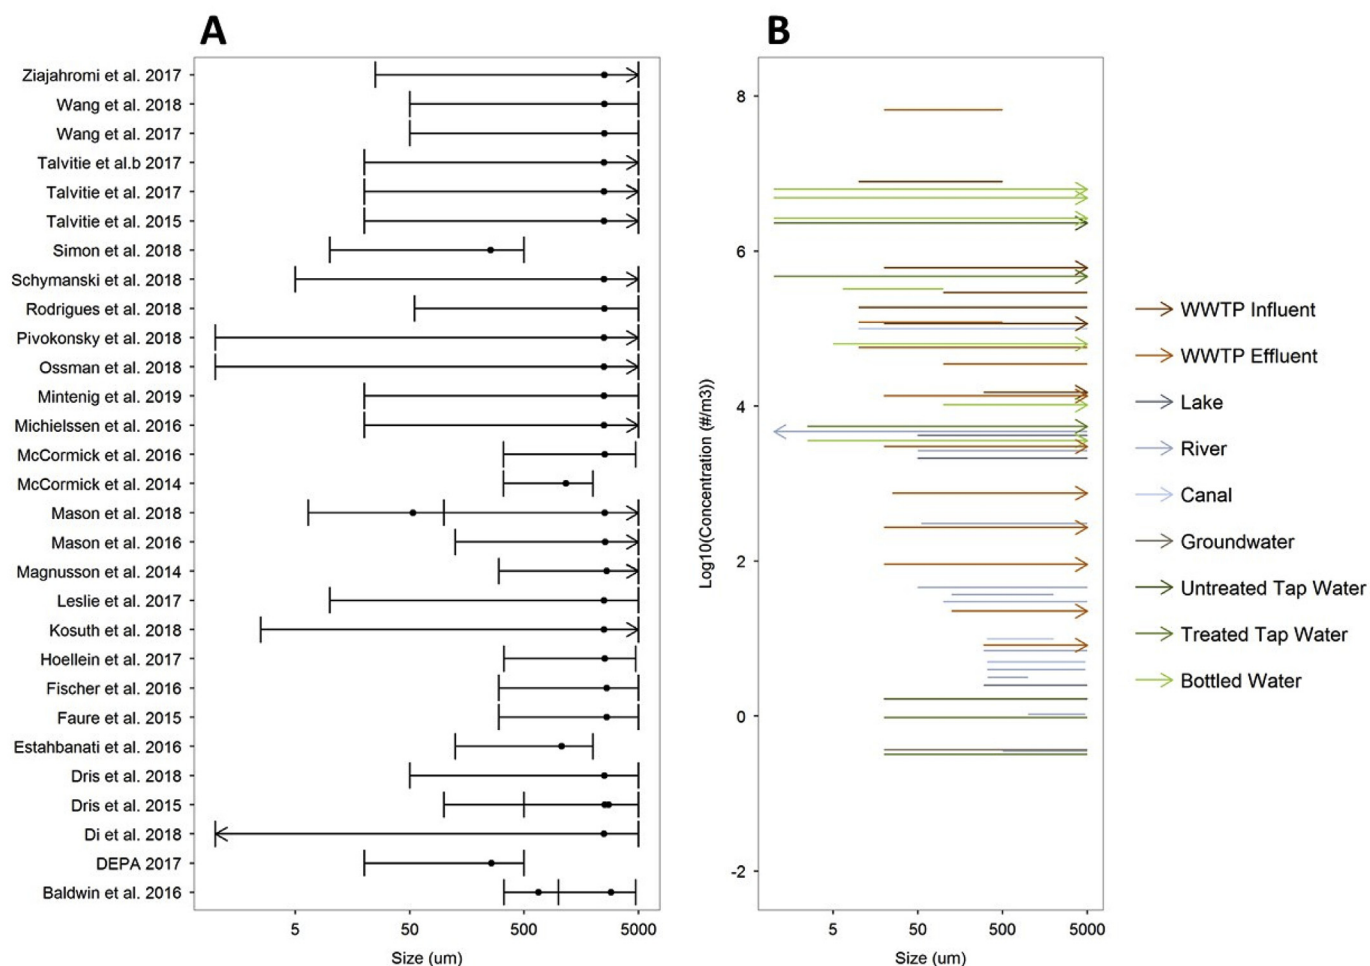

Fig. 4. Size ranges used (A) and number concentrations per size range reported (B) in studies on microplastics in drinking, surface and waste waters (referenced in Fig. 1). Arrows indicate that no upper or lower size limit was specified, in which case values of $5 \mu\text{m}$ or $1 \mu\text{m}$ were assigned, respectively. Panel A: Size ranges per study are ordered alphabetically per author name. Data points represent the average of the size range. Panel B: reported concentrations as a function of size range. Colours of arrows (Panel B) correspond to colours of the box and whiskers in Fig. 1. (For interpretation of the references to colour in this figure legend, the reader is referred to the Web version of this article.)

Acrylic or acrylic-related compounds, PA, PEST and PMMA reported in five or more records (Fig. 3). The order of the five most abundant polymers can be roughly explained by two factors; global plastic demand and polymer density (Andrady, 2011; Bond et al., 2018). Global plastic demand would cause an order of $PE > PP > PVC > PET > PS$ (Bond et al., 2018; Geyer et al., 2017). However, whereas PE and PP have densities below 1 g/cm^3 and are buoyant and PS has a density close to that of water, PVC and PET have densities of $1.3\text{--}1.7 \text{ g/cm}^3$. Therefore, a relatively high degree of settling could explain the lower abundances of PVC and PET in the surface water samples mostly assessed here. Specific subsets, i.e. Lakes/Rivers versus WWTP samples were checked for differences in relative abundances of polymer types, but no such differences were found. For a more detailed analysis of polymers reported in studies, the reader is referred to Table S1, which provides all observed polymers on an individual record basis. Recently, Bond et al. (2018) provided a review of polymer abundance data across environmental compartments in Europe, including 3 surface water and 5 WWTP studies. Instead of providing the reporting incidence across a large number of global studies, they averaged relative abundances reported across these 8 European studies, yet found the same order of abundances for the 5 most dominant polymers.

3.2.4. Sizes of microplastic particles

Studies generally did not report sizes or size distributions relating to individual particles, which precludes a meta-analysis of particle size across studies. However size classes were reported (Table S1) as well as the number of particles observed per size class. Still, this does not allow for a meaningful quantitative analysis, because the size bins vary widely across studies (Fig. 4A). Furthermore, often lower or upper size limits are not specified so that it is not clear to what size class reported number concentrations actually relate. Instead of plotting the reported size ranges across studies (Fig. 4A), reported ranges can be plotted against mean particle number concentrations (Fig. 4B). The latter graph clearly shows that studies aiming for smaller particles, like some of the bottled water and tap water studies, generally find the higher particle number concentrations.

4. Conclusions

We conclude that based on the limited number of high quality studies identified, standardization of microplastic analysis in water is needed. Quality assurance criteria that require the most improvements are sample treatment, polymer identification, laboratory preparation, clean air conditions and positive controls. In addition to ensuring that individual studies are of higher quality in order to achieve more confidence in study findings, standardized methods will allow reproducibility and comparability of results and will lead to the quality of data that are needed to conduct risk assessments. Among water types, reported microplastic concentrations differed widely, but the fact that studies target different size classes contributes to this variability. Despite the quality limitations, our analysis confirmed that microplastic is frequently present in freshwaters and drinking water. There is a high need to improve the analysis of very small microplastics, and to identify them in different water samples. Fragments, fibers, film, foam and pellets were the most frequently found microplastic shapes in surface water samples. Relative abundance of polymer types found across studies reflected plastic production and polymer densities. Conclusions on size comparisons among studies and water types are difficult to draw due to the aforementioned differences in targeted particle sizes. More studies are needed to better understand occurrence, shape, polymer types, and particle sizes, particularly for the small plastic particles.

Declarations of interest

None.

Conflicts of interest

There is no conflict of interest.

Author agreement

AAK and JDF designed the study. NHMN, EH, MK, SM and AAK performed the study. AAK wrote the article. NHMN, EH, MK, SM and JDF commented on draft versions of the article. All authors have approved the final article.

Disclaimer

The authors alone are responsible for the views expressed in this publication and they do not necessarily represent the views, decisions or policies of the World Health Organization.

Acknowledgment

This work was financially supported by the World Health Organization (WHO contract registration 2018/825515-0). Peter Marsden (Defra) is gratefully acknowledged for critical comments on an earlier version of the manuscript.

Appendix A. Supplementary data

Supplementary data to this article can be found online at <https://doi.org/10.1016/j.watres.2019.02.054>.

Microplastics in drinking-water

Key messages

- ◆ Microplastics are ubiquitous in the environment and have been detected in a broad range of concentrations in marine water, wastewater, fresh water, food, air and drinking-water, both bottled and tap water. The data on the occurrence of microplastics in drinking-water are limited at present, with few fully reliable studies using different methods and tools to sample and analyse microplastic particles.
- ◆ The potential hazards associated with microplastics come in three forms: physical particles, chemicals and microbial pathogens as part of biofilms. Based on the limited evidence available, chemicals and biofilms associated with microplastics in drinking-water pose a low concern for human health. Although there is insufficient information to draw firm conclusions on the toxicity related to the physical hazard of plastic particles, particularly for the nano size particles, no reliable information suggests it is a concern.
- ◆ Limited evidence suggests that key sources of microplastic pollution in fresh water sources are terrestrial run-off and wastewater effluent. However, optimized wastewater (and drinking-water) treatment can effectively remove most microplastics from the effluent. For the significant proportion of the population that is not covered by adequate sewage treatment, microbial pathogens and other chemicals will be a greater human health concern than microplastics.

Recommendations

- ◆ **Water suppliers and regulators** should continue to prioritize removing microbial pathogens and chemicals from drinking-water that are known significant risks to human health. As part of water safety planning, water suppliers should ensure that control measures are effective, including optimizing water treatment processes for particle removal and microbial safety, which will incidentally improve the removal of microplastic particles. Routine monitoring of microplastics in drinking-water is not necessary at this time.
- ◆ To better assess the human health risks and inform management actions, **researchers** should undertake targeted, well-designed and quality-controlled investigative studies to better understand the occurrence of microplastics in the water cycle and in drinking-water throughout the water supply chain, the sources of microplastic pollution and the uptake, fate and health effects of microplastics under relevant exposure scenarios.
- ◆ Irrespective of any human health risks posed by exposure to microplastics in drinking-water, measures should be taken by **policy makers and the public** to better manage plastics and reduce the use of plastics where possible, to minimize plastics released into the environment because these actions can confer other benefits to the environment and human well-being.

Key questions and answers

What are microplastics?

As a category, microplastics encompass a wide range of materials composed of different substances, with different densities, chemical compositions, shapes and sizes. There is no scientifically-agreed definition of microplastics, although they are frequently defined as plastic particles <5 mm in length. However, this is a rather arbitrary definition and is of limited value in the context of drinking-water since particles at the upper end of the size range are unlikely to be found in treated drinking-water. A subset of microplastics <1 µm in length are often referred to as nanoplastics.

How do microplastics get into drinking-water?

Microplastics may enter drinking-water sources in a number of ways: from surface run-off (e.g. after a rain event), to wastewater effluent (both treated and untreated), combined sewer overflows, industrial effluent, degraded plastic waste and atmospheric deposition. Surface run-off and wastewater effluent are recognized as the two main sources, but better data are required to quantify the sources and associate them with more specific plastic waste streams. Plastic bottles and caps that are used in bottled water may also be sources of microplastics in drinking-water.

How much microplastic has been found in drinking-water and drinking-water sources?

In freshwater studies, reported microplastic particle counts ranged from around 0 to 1000 particles/L. Only nine studies were identified that measured microplastics in drinking-water; these studies reported particle counts in individual samples from 0 to 10 000 particles/L and mean values from 10⁻³ to 1000 particles/L. A comparison of the data between fresh water and drinking-water studies should not be made because in most cases freshwater studies targeted larger particles, using filter sizes that were an order of magnitude larger than those used in drinking-water studies.

What kinds of microplastics are being found?

In fresh water a wide variety of particle shapes have been found while the polymers most frequently detected roughly correlates with plastic production volumes. In drinking-water, fragments and fibres were the predominant particle shapes and polyethylene terephthalate and polypropylene were the polymers most detected.

Can these studies be trusted?

A WHO-commissioned study concluded that most of these studies are not fully reliable because their methods lacked sufficient quality control. Results should therefore be interpreted with caution. The quality control areas requiring the most improvement included sample treatment, polymer identification, laboratory preparation, clean air conditions and positive controls. For example, in two drinking-water studies and for a subset of smaller particles in a third study, no spectroscopic analysis was conducted to confirm that the particles identified were plastic. Four of the 52 studies that scored highest for quality were published in 2017 and 2018, indicating some improvements in quality control.

What are the potential threats posed by microplastics in drinking-water?

The potential hazards associated with microplastics come in three forms: physical particles, chemicals and microbial pathogens that are part of biofilms. Particles may cause impacts in the body, depending on a range of physicochemical properties of the particle, including size, surface area and shape. However, the fate, transport and health impacts of microplastics following ingestion are not well studied, with no human studies on ingested microplastics. Although plastic polymers are generally considered to be of low toxicity, plastics and microplastics can contain unbound monomers and additives. Hydrophobic chemicals in the environment, including persistent organic pollutants, may also sorb to the plastic particle. Biofilms in drinking-water are formed when microorganisms grow on drinking-water distribution systems and other surfaces. Most microorganisms that are part of biofilms are non-pathogenic. However, some biofilms can include pathogens such as *Pseudomonas aeruginosa*, *Legionella* spp., non-tuberculosis *Mycobacterium* spp. and *Naegleria fowleri*.

The health risk from microplastics in drinking-water is a function of both hazard (potential to cause adverse effects) and exposure (dose). The same substance can have different effects at different doses, which depends on how much of the substance a person is exposed to and may also depend on the route by which the exposure occurs, e.g. ingestion, inhalation or injection. The risks associated with each hazard class are further described below.

What is the human health risk of ingesting microplastic particles through drinking-water?

Although there is insufficient information to draw firm conclusions on the toxicity of plastic particles and particularly the nano size particles, no reliable information suggests it is a concern. Studies on absorption indicate that microplastics > 150 µm are likely to be excreted directly through faeces. Uptake of smaller particles is expected to be limited, although absorption and distribution of very small microplastic particles including nanoplastics may be higher. Toxicology studies in rats and mice reported some impacts including inflammation of the liver. However, these few studies are of questionable reliability and relevance, with findings reported at very high exposures that would not occur in drinking-water.

What is the human health risk from chemicals associated with microplastics in drinking-water?

Risk assessments have been conducted for many chemicals to determine the level at which no or limited adverse effects should occur (toxicological point of departure, POD). To assess health risks of chemicals associated with microplastics, a margin of exposure (MOE) assessment was conducted for the chemicals that have been detected in microplastics, are of toxicological concern and have adequate or accepted toxicological PODs. Since there are several orders of magnitude difference between estimated intakes from a very conservative exposure scenario and the PODs, chemicals associated with microplastics in drinking-water are a low concern.

What is the human health risk associated with biofilms that attach to microplastics in drinking-water?

Biofilms associated with microplastics are considered a low health concern considering the relative concentration of microplastics compared to other particles that pathogens can adhere to in fresh water. For microplastics that are not removed during drinking-water treatment, the relative significance of microplastic-associated biofilms is still likely negligible due to the larger mass of drinking-water distribution systems and their subsequent ability to support more biofilms, compared to microplastics. Disinfection, including in distribution systems can inactivate pathogens and control their growth.

How do the risks from microplastics stack up against other potential risks to drinking-water?

Microbial pathogens represent the most significant public health threat in drinking-water. In 2016, 485 000 diarrhoeal related deaths were attributed to microbially-contaminated drinking-water (Prüss-Ustün, 2019) and it is estimated that 2 billion people are drinking faecally contaminated water (WHO, UNICEF, 2017).

A significant source of faecal contamination in drinking-water is inadequately or untreated wastewater. About 20% of wastewater collected in sewers does not undergo at least secondary treatment and an even higher proportion of people lack access to sewage connections or other appropriate systems for collecting and treating wastewater. Therefore, although wastewater effluent is recognized as a key source of microplastic pollution in freshwater, pathogens and other chemicals associated with the lack of effective sewage treatment are of greater concern. By addressing the bigger problem of exposure to faecally contaminated water, communities can simultaneously address the smaller concern related to microplastics.

How can microplastics be removed from drinking-water?

Wastewater and drinking-water treatment systems—where they exist and are optimized—are considered highly effective in removing particles of similar characteristics and sizes as microplastics. According to available data, wastewater treatment can effectively remove more than 90% of microplastics from wastewater with the highest removals from tertiary treatment such as filtration. Drinking-water treatment has proven effective in removing far more particles of smaller size and at far higher concentrations than those of microplastics. Conventional treatment, when optimized to produce treated water of low turbidity, can remove particles smaller than a micrometre. Advanced treatment can remove even smaller particles; for example, nanofiltration can remove particles $>0.001\ \mu\text{m}$ while ultrafiltration can remove particles $>0.01\ \mu\text{m}$.

Based on the conclusions of the report, should any actions be taken to minimize microplastic pollution in drinking-water? If so, what actions should be taken?

Irrespective of any human health risks posed by microplastics in drinking-water, policy-makers and the public should take action to minimize plastics released into the environment, since these actions will confer multiple other benefits for the environment and human well-being. Actions could include reducing the use of plastics where possible, improving recycling programmes, reducing littering, improving circular solutions and decreasing industrial waste inputs into the environment. Care must be taken, however, to select mitigating actions that do not create new problems.

Based on the conclusions of the report, what actions should be taken by water suppliers and drinking-water regulators?

Water suppliers and regulators should continue to prioritize the removal of microorganisms and chemicals in drinking-water that pose a public health concern. As part of water safety planning, water suppliers should ensure that control measures are effective and should optimize water treatment processes for particle removal and microbial safety, which will incidentally improve the removal of microplastic particles. Routine monitoring of microplastics in drinking-water is not recommended at this time, as there is no evidence to indicate a human health concern.

What further research is needed?

A number of research gaps need to be filled to better assess the risk of microplastics in drinking-water and inform management actions. Targeted, well-designed and quality-controlled investigative studies should be carried out to better understand microplastics occurrence throughout the water supply chain, including the numbers, shapes, sizes, composition and sources of microplastics and to better characterize the effectiveness of water treatment. Research is also needed to understand the significance of treatment-related waste streams as contributors of microplastics to the environment. Quality-assured toxicological data are needed on the most common forms of plastic particles relevant for human health risk assessment. Further, a better understanding on the uptake and fate of microplastics and nanoplastics following ingestion is needed. Finally, given that humans can be exposed to microplastics through a variety of environmental media, including food and air, a better understanding of overall exposure to microplastics from the broader environment is needed.

Where will WHO direct its future research on the human-health effects of microplastics in the environment?

Given that humans can be exposed to microplastics through a variety of environmental media, WHO has initiated a broader assessment of microplastics in the environment. A future report will characterize the potential human health risks due to total microplastic exposure from the environment, including through food and air.

Solving Microplastic Pollution Means Reducing, Recycling—and Fundamental Rethinking

New practices, and new chemistries, are needed to end the scourge

By Andrea Thompson on November 12, 2018

Rubbish left stranded by the tide on the River Thames. Credit: Anthony John West *Getty Images*

This is the third of a three-part series that examines our growing understanding of the scope and impacts of microplastics pollution.

You have 3 free articles left.

At several locations around London last winter and spring, researchers stalked the streets counting the number of discarded plastic water bottles they encountered, as they tallied species across a coral reef

[See Subscription Options](#)

Their aim was to see if a new initiative to enlist businesses where people can refill empty bottles with tap water was making a dent in the trash littering the pavement, says marine biologist Heather Koldewey, who oversaw the research. Bottled water use has doubled in the U.K. in the past 15 years. And notably, plastic bottles are abundant along the banks of the River Thames, which carries them out to sea as they gradually break down into ever smaller fragments, tainting the river and the ocean with microplastics that can invade every level of the food chain.

ADVERTISEMENT

Scientists have found these tiny bits of degraded plastic—along with fibers shed from synthetic fabric, and microbeads from cosmetics—lurking throughout the oceans, lakes, soil and even the air. Creatures from plankton to earthworms to humans are eating them, posing a potentially serious health threat to animals and ecosystems. The problem is only expected to balloon as plastic production increases exponentially—from a mere two million metric tons annually in 1950 to more than 300 million metric tons today, and a projected 33 billion metric tons each year by 2050.

To get the microplastics problem under control, the world has to take three primary steps, those who study the issue say. In the short term society needs to significantly curtail unnecessary single-use plastic items such as water bottles, plastic shopping bags, straws and utensils. In the medium term governments need to strengthen garbage collection and recycling systems to prevent waste from leaking into the environment between the trash can and the landfill, and to improve recycling rates. In the long run scientists need to devise ways to break plastic down into its most basic units, which can be rebuilt into new plastics or other materials. “There’s definitely no single solution,” says Koldewey, of the Zoological Society of London and a National Geographic Fellow.

REDUCE AND RECYCLE

An attractive, low-hanging target for tackling microplastic pollution is the drink bottles, utensils and bags that are called single-use plastics. Because they are used for convenience, not necessity, they are easier to do without, and the polymers used to make

You have 3 free articles left.

becoming an increasingly popular way of curtailing their use, and limited evidence indicates they do reduce debris. But as Koldewey and others point out, governments that impose bans need to consider: whether such measures are cost-effective; what the environmental impacts of alternatives are; and what roadblocks such as, in the case of bottled water, a lack of places to fill up a reusable bottle might hamper the effectiveness of a ban.

Koldewey's own campaign to reduce the use of bottled water in London, called #OneLess, studied possible locations for placing refilling kiosks that would get the most use, such as public transportation hubs. The group also conducted surveys that found most residents would prefer to get water from the tap but were uncomfortable asking stores or restaurants for a free refill. The initiative to sign up businesses that would allow people to refill their bottles was aimed at overcoming that reluctance. Addressing such potential barriers is crucial to changing people's habits, Koldewey says.

Reducing single-use plastics will help the environment because the packaging sector more broadly is the biggest user of plastic polymers. But plastic, including some of the same polymers found in single-use packaging, is also used in construction, electronics and fabrics. The latter are the sources that are proving to be one of the most ubiquitous forms of microplastic pollution. Scientists are concerned that focusing on single-use plastics will obscure more systemic issues around plastic that need to be addressed. “It’s a super-useful first step,” says Martin Wagner, an ecotoxicologist at Norwegian University of Science and Technology. “What I’m afraid of is that that will be it.”

ADVERTISEMENT

His worry is well founded. In Europe only 30 percent of plastic is recycled, whereas in the U.S. it is a measly 9 percent. “Our waste management systems are good, our use of them is pretty lousy,” Koldewey says. The need to expand recycling capacity in places like the U.S. is becoming acute now that China—which has imported 45 percent of all plastic waste intended for recycling since 1992—has closed its doors, leaving many Western countries with nowhere but the landfill to ship their discarded plastic.

One key aspect of improving recycling, some experts say, is designing products so they are easier to recycle. Plastic is typically recycled by shredding it, melting it down and molding it into new plastics. But other chemicals added to improve product flexibility or durability, or to simply add color, make it difficult to recycle and reduce the quality of recycled plastics. “We’re taking some of what are potentially our most recyclable polymers and rendering them unrecyclable because of inadequate or inappropriate thought at the design stage,” says Richard Thompson, a marine biologist at the University of Plymouth. As an example of a potential remedy, he cites Japan, where all polyethylene terephthalate (PET), used in plastic bottles, is transparent. Clear PET is much easier to recycle than when coloring is added in. “It’s possible to do it,” he says.

RETHINKING PLASTIC AND RECYCLING

~~Curtailing the use of plastic and improving recycling and waste systems would put a~~

recyclable and some will still likely make their way into rivers, soil and seas. In the long term, some scientists think changing the very nature of the material and the methods of recycling it could be the ultimate solution to the plastic problem. “We need a much more fundamental change in our approach.”

For years materials scientists have been trying to create plastics that will biodegrade. Today plastic that is labeled biodegradable can actually only be broken down in specialized facilities that heat it to high temperatures. “In an aquatic environment, in your backyard compost pile, that’s not going anywhere,” says Sherri Mason, a professor of chemistry at the State University of New York at Fredonia.

There is a fundamental tension to creating truly biodegradable plastic, because a polymer that will completely degrade into carbon, oxygen and other elements in a lake or soil would not be particularly useful as packaging, say for keeping food on a shelf for months. “There’s a central problem around what we want versus what’s realistic,” says Andrew Dove, a chemist at the University of Birmingham. Thompson thinks biodegradable plastic may need to be confined to products only needed for a short time that are then discarded, such as burger wrappers at sports stadiums or utensils at fast-food restaurants.

ADVERTISEMENT

What Dove and a growing number of materials scientists envision to reshape our relationship with all plastics is to move from physically recycling plastics by grinding them up to chemically dismantling them to weed out all the impurities that taint recycled plastic. Such a method would take a PET bottle, for example, and break it down into its most basic molecules, separating out added chemicals to provide the building blocks to remake virgin polymers. In this way plastic would become its own perpetual

You have 3 free articles left.

not just chemically broken down). “With some plastics, there’s no reason why you can’t infinitely recycle,” Dove says. “People just haven’t looked at it. It’s not been considered something that’s important.”

[See Subscription Options](#)

For the polymers that cannot be unraveled into their most basic molecules, Dove thinks it should be possible to at least chemically break them up into other small molecules that could be used for different purposes, such as fuel or pharmaceuticals. Ideally, scientists would devise chemical reactions that did not require too many harsh compounds and are not too expensive. That would give value to the plastic waste that currently has no, or very little, value. Currently, “it’s much cheaper to burn them or to throw them away in landfills, and that’s the core of the issue,” Wagner says.

Making discarded plastic valuable could also provide incentive for cleaning up the plastic waste already in the environment. “If we can create something high-value from cheap plastic waste, there might be an economic argument to go and dredge this out of the ocean,” Dove says. “We’re a long way from that, but that’s what we’d like to achieve.”

A few scientists have already begun to look at ways to clean up some of the microplastic waste, which could remain in the environment for at least several hundred years. Cleanup is difficult because the plastic particles are small and varied in nature, and the ecosystems in which they are embedded are vast. Researchers have found enzymes and bacteria that can break down certain types of plastic, but they need to figure out how these might be deployed without any potential negative side effects, such as producing greenhouse gases. Agroecologist Esperanza Huerta Lwanga, of Wageningen University in the Netherlands and the College of the Southern Frontier in Mexico, for example, hopes to test whether earthworms that possess plastic-munching bacteria in their guts might be able to remediate soil littered with plastic from the burning of trash.

While those methods are being developed, cutting off the flow of plastic is key. Doable steps need to be taken now. “The bottom line,” Thompson says, “really is that all of this [pollution] is avoidable.”

ENVIRONMENT

From Fish to Humans, A Microplastic Invasion May Be Taking a Toll

Tiny bits of plastic have seeped into soil, fish and air, posing a threat to animal and human health

By Andrea Thompson on September 4, 2018

A Rainbow Runner in the North Pacific Gyre that had ingested 18 pieces of plastic (2008). Credit: Dr. Marcus Eriksen Gyres Institute

This is the second of a three-part series that examines our growing understanding of the scope and impacts of microplastics pollution.

Mark Browne had a suspicion. He hoped the samples of dried blood taken from a blue mussel and placed under a special microscope would tell him if he was correct. As a fuzzy, three-dimensional image of the mussel's blood cells appeared, there they were, right in the middle—tiny specks of plastic.

Whereas photos of sea turtles eating plastic bags have become the poster child of the environmental harm wrought by humanity's plastic waste, research like Browne's illustrates the scope of the problem is far larger than the trash we can see. Tiny pieces of degraded plastic, synthetic fibers and plastic beads, collectively called microplastics, have turned up in every corner of the planet—from Florida beach sands to Arctic sea ice, from farm fields to urban air.

ADVERTISEMENT

Their size—from about five millimeters, or the size of a grain of rice, down to microscopic—means they can be ingested by a wide range of creatures, from the plankton that form the basis of the marine food chain to humans. As Browne's 2008 study was one of the first to demonstrate, those plastic particles don't always pass harmlessly through the body. The finding "was one of those sort of bittersweet moments," the ecotoxicologist at the University of New South Wales in Sydney says. "You're pleased that some prediction you've made has come true—but then you're devastated" because of the potentially profound ecological implications.

Ingested microplastic particles can physically damage organs and leach hazardous chemicals—from the hormone-disrupting bisphenol A (BPA) to pesticides—that can compromise immune function and stymie growth and reproduction. Both microplastics and these chemicals may accumulate up the food chain, potentially impacting whole ecosystems, including the health of soils in which we grow our food. Microplastics in the water we drink and the air we breathe can also hit humans directly.

Browne is one of dozens of scientists trying to sort out exactly what this widespread, motley assortment of microplastics pollution might be doing to animals and ecosystems. Tantalizing evidence is emerging, from the impaired reproduction of fish to altered soil microbe communities. As researchers accumulate more data, “we start realizing we’re just at the tip of the iceberg with the problem,” Browne says.

A THREAT TO ORGANS AND BLOODSTREAM

When Browne experimented with blue mussels back in 2008, many researchers thought animals would just excrete any microplastics they ate, like “unnatural fiber,” as Browne called it—but he wasn’t so sure. He tested the idea by placing mussels in water tanks spiked with fluorescent-tagged microplastic particles smaller than a human red blood cell, then moved them into clean water. For six weeks he harvested the shellfish to see if they had cleared the microplastics. “We actually ran out of mussels,” Browne says. The particles “were still in them at the end of those trials.”

The mere presence of microplastics in fish, earthworms and other species is unsettling, but the real harm is done if microplastics linger—especially if they move out of the gut and into the bloodstream and other organs. Scientists including Browne have observed

signs of physical damage, such as inflammation, caused by particles jabbing and rubbing against organ walls. Researchers have also found signs ingested microplastics can leach hazardous chemicals, both those added to polymers during production and environmental pollutants like pesticides that are attracted to the surface of plastic, leading to health effects such as liver damage. Marco Vighi, an ecotoxicologist at the IMDEA Water Institute in Spain, is one of several researchers running tests to see what types of pollutants different polymers pick up and whether they are released into the freshwater and terrestrial animals that eat them. The amount of microplastics in lakes and soils could rival the more than 15 trillion tons of particles thought to be floating in the ocean's surface alone.

ADVERTISEMENT

Plastics Permeate the Planet

Plastic polymers and the added chemicals that make them more durable and flexible have been used in thousands of combinations, found in everything from clothing to electronics to paint. One of the biggest categories is single-use packaging, such as plastic grocery bags and soft drink bottles. This prevalence is reflected in the polymers that show up most commonly in the microplastic debris found in the environment.

Common Polymers and Ways They Are Used

Polyethelene (PE)  Plastic bags, storage containers	Polypropylene (PP)  Bottle caps, rope, gear, strapping	Polystyrene (PS)  Utensils, cups, floats, coolers, containers	Polyamide (nylon) (PA)  Rope, fishing nets, textiles	Polyester (PES)  Textiles, boats
Acrylic (AC)  Latex paint, coatings, medical devices	Polyoximethylene (POM)  Automotive parts, electronics	Polyvinyl alcohol (PVA)  Laundry detergent pods, fishing bait	Polyvinyl chloride (PVC)  Pipe, film, containers	Poly methyl acrylate (PMA)  Laminated safety glass (e.g. car windshields)
Polyethelene terephthalate (PET)  Drink bottles, textile fibers	Alkyd (AKD)  Resins, paints	Polyurethane (PU)  Ship varnish, construction, automotive parts		

How Often Polymers Are Found in Marine Microplastic Debris

Credit: Amanda Montañez; Source: "Sources, Fate and Effects of Microplastics in the Marine Environment: A Global Assessment," edited by Peter J. Kershaw, (IMO/FAO/UNESCO-IOC/UNIDO/WMO/IAEA/UN/UNEP/UNDP Joint Group of Experts on the Scientific Aspects of Marine Environmental Protection), GESAMP Reports and Studies, No. 90; 2015

What matters most is whether these physical and chemical impacts ultimately affect an organism's growth, reproduction or susceptibility to illness. In a surprising study published in March, not only did fish exposed to microplastics reproduce less but their offspring, who weren't directly exposed to plastic particles, also had fewer young, suggesting the effects can linger into subsequent generations. Some organisms such as freshwater crustaceans called amphipods haven't yet exhibited any ill effects, perhaps because they can handle natural indigestible material like bits of rock, says Martin Wagner, an ecotoxicologist at Norwegian University of Science and Technology, who studied them. And some species have shown toxic effects from microplastics exposure from certain types of plastic, but not others, says Chelsea Rochman, a microplastics researcher at the University of Toronto.

Most work on microplastic impacts has been done in the lab for short stints, with only a single type of plastic, often with larger particles than some species tend to eat, and at higher concentrations than are found in the environment. The studies "won't tell us about long-term ecological consequences happening at low concentrations," Wagner

says. He is one of several researchers starting to bridge that gap by matching animals to the polymers and pollutants they are most likely to encounter and incorporating the intricacies of the real world where microplastics “won’t be the only stressor,” Wagner says. Microplastics could be a last straw for species subject to pressures as chemical pollutants, overfishing and climate change. “It’s just damn complicated,” Wagner says.

INVITING CHAOS

Messy, real-world conditions are the goal on the green lawn of a botanical garden in Frankfurt, Germany. A row of small, identical ponds stretch across the grass, exposed to the elements. Wagner spiked each one with different microplastic particles—some virgin polymers, some contaminated with pollutants—to see how freshwater insects and zooplankton fare. Although Wagner hasn’t yet observed any overt impacts, he is investigating whether certain organisms exhibit more subtle signs of harm, which could have a ripple effect throughout an ecosystem’s food web.

Celebrating 175 Years of Discovery

[Learn More](#)

Such cascading impacts could happen even when individual species don’t seem to suffer. Browne’s mussels showed no short-term ill effects but he worries their accumulated microplastics could be transferred to animals that eat them. “They might not be so kind to the other organisms,” he says.

Mesocosm pools at Goethe University in Frankfurt am Main, Germany, where Martin Wagner and his colleagues study the impacts of microplastics on different animals in semirealistic conditions. Credit: Martin Wagner

Like Wagner, Browne is venturing farther out into the real world. He has several freezers' worth of fish and other organisms plucked from Sydney Harbor that he will examine for ingested microplastics. His team will be linking those to the routes by which microplastics might be entering the harbor and looking for signs of ecological damage such as changes in population size. The approach means animals can behave normally and are exposed to typical environmental conditions such as tides and storms, as well as a host of other stressors such as changing ocean temperatures and industrial pollutants. "We want a chaotic system because if something can cause an impact in that chaotic system, above those other stresses, we know that we really, really need to be worried about it," Browne says.

ADVERTISEMENT

Matthias Rillig, a plant ecologist at Free University of Berlin, has shown how microplastics can affect organisms by altering their environments. In a recent study he co-authored, soil laden with polyester microfibers was much fluffier, retained more moisture and seemed to affect the activity of microbes that are crucial to the soil nutrient cycle. The finding is an early but concerning one, given that farmers around the world apply microfiber-rich treated sewage sludge as fertilizer to agricultural land. Rillig is also one of several scientists looking to see how microfibers in soils might be affecting crop growth.

FULL CIRCLE

Microplastics may threaten people more directly. A study published in April found particles and microfibers in packaged sea salt, beer, bottled water and tap water, making it virtually certain we are ingesting microplastics. In bottled beverages microplastics could be infiltrating during the bottling process; microfibers could be falling from the atmosphere into the reservoirs that supply tap water. Even for researchers steeped in the field, “it still comes as a shock,” Rochman says. “It just shows that the mismanagement of our waste is coming back to us.”

Because it is unethical to intentionally feed doses of microplastic particles to humans, some researchers, like Browne, have turned to medical studies that use particles to deliver precise amounts of drugs to specific areas of the body to get a better sense of how easily microplastics might move through humans. If particles are small enough, they might migrate through the body and potentially accumulate in places like the bloodstream. A study of hamsters injected with microplastics suggests such particles can lead to blood clots.

A close-up of one of the mesocosm pools, where insects and other species under study live among the plants and sediment they would in the real world to get a better understanding of how microplastics might affect them in their natural habitat. Credit: Martin Wagner

Humans could also be inhaling microfibers as they fall from the sky—everywhere from the heart of Paris to the remote Arctic. Small airborne particles are known to lodge deep in the lungs where they can cause various diseases, including cancer. Factory workers who handle nylon and polyester have shown evidence of lung irritation and reduced capacity (although not cancer), but they are exposed to much higher levels than the average person. Stephanie Wright, a research associate at King's College London, is trying to better understand how much microfiber humans are actually exposed to and whether airborne microplastics might penetrate the lungs. She is also teaming up with the university's toxicology unit to examine their lung tissue collection for signs of microfibers and related damage.

Some scientists say the focus on microplastics in humans might be missing a larger point: People are continually exposed to plastic food and beverage containers, which

could be a much bigger source of at least the chemicals added to plastics such as the endocrine disruptor BPA. The potential exposure to microplastics hasn't stopped Rochman from eating seafood, however. "To the best of my knowledge the benefits outweigh the costs," she says. It could be that, as with many pollutants, there is a threshold beyond which microplastics become toxic to humans or other species. "We just need to try to understand what that threshold is," she notes.

ADVERTISEMENT

Experts say the sheer ubiquity of the contaminant combined with the harm that has already been observed is enough for humanity to start to clean up its act. "There are always questions to be answered," Rochman says, but we have reached the point where "it's enough information to act toward solutions."

Part 3: Solving Microplastic Pollution Means Reducing, Recycling—And Fundamental Rethinking

Abstract: The distribution and abundance of microplastics into the world are so extensive that many scientists use them as key indicators of the recent and contemporary period defining a new historical epoch: The Plasticene. However, the implications of microplastics are not yet thoroughly understood. There is considerable complexity involved to understand their impact due to different physical–chemical properties that make microplastics multifaceted stressors. If, on the one hand, microplastics carry toxic chemicals in the ecosystems, thus serving as vectors of transport, they are themselves, on the other hand, a cocktail of hazardous chemicals that are added voluntarily during their production as additives to increase polymer properties and prolong their life. To date, there is a considerable lack of knowledge on the major additives of concern that are used in the plastic industry, on their fate once microplastics dispose into the environment, and on their consequent effects on human health when associated with micro and nanoplastics. The present study emphasizes the most toxic and dangerous chemical substances that are contained in all plastic products to describe the effects and implications of these hazardous chemicals on human health, providing a detailed overview of studies that have investigated their abundance on microplastics. In the present work, we conducted a capillary review of the literature on micro and nanoplastic exposure pathways and their potential risk to human health to summarize current knowledge with the intention of better focus future research in this area and fill knowledge gaps.

Keywords: microplastics; additives; human health; nanoplastics

1. The Plasticene

In the last 70 years, we have abetted an increasing growth in the worldwide plastics production, which has consequently spread into the environment to such a point that we can say to live in a plastic world [1,2]. These synthetic polymers are environmental pollutants themselves and act as vectors of transport of various kind of chemicals [3], but they are also considered valid indicators of the recent and contemporary period, generally after the middle of the 20th century [4].

Nowadays, microplastic particles have been ubiquitously detected in a broad range of shapes, polymers, sizes and concentrations in the environments of marine water, freshwater [5], agroecosystems [6], atmosphere [7], food [8] and drinking-water [9], biota [10], and other remote locations [11].

They can be as thin as small veils and be carried away by the wind from miles away, or they can be hard and compact like rocks [12].

Their worldwide distribution is so vast that many scientists use it as a key geological indicator of the Anthropocene [4].

Plastic materials can be used as stratigraphic markers in the archaeological field by considering them as recent and precise indicators of earth deposits.

Some authors identify the period from 1945 onwards as a moment of a significant increase in plastics deposition, to the point that they have used this stratigraphic marker as an excellent indicator [13].

Figure 1 shows a famous picture taken by Spanish students during a university trip. In the photo, the flood level river in the canyon bed is well-recorded thanks to the deposition of plastic micro-fragments that by now have been well-mixed with the sedimentary curly making up the canyon.

We found a similar situation in Southern Italy; indeed, in Figures 2 and 3, it is possible to observe that plastics were even used to fill the road surface, probably to obtain a double advantage: no disposal costs for materials and no costs for the use of suitable materials (excavated rocks).

Figure 1. Appearance of the deposition and stratification of plastic materials in a Spanish canyon (Source: [16]).

Figure 2. Layering of plastic materials in an area of Southern Italy.

Figure 3. Detail of the plastic stratigraphy.

According to the layers, once accumulated and stratified, the sediment, which consists of fragments of various plastic sizes, can have a good conservation potential that is comparable to that one of recalcitrant organic fossils. Such synthetic fossil-based materials are so abundant and widespread on Earth that we can consider them “technofossils” as they will constitute a perennial proof of the existence of humans on Earth [4] to the point of being able to define this historical epoch as the Plasticene [14,15].

2. Plastics and Co-Contaminants

Microplastics (MPs) are defined by [17] as “synthetic solid particles or polymeric matrices, with regular or irregular shape and with size ranging from 1 μm to 5 mm, of either primary or secondary manufacturing origin, which are insoluble in water.”

A key concern of microplastics pollution is whether they represent a risk to ecosystems and human health. However, there is much uncertainty associated with this issue. Data on the exposure and effect levels of microplastics are therefore required to evaluate the risk of microplastics to environments and human health. The adverse effects on organisms that are exposed to microplastics can be separated into two categories: physical effects and chemical effects. The former is related to the particle size, shape, and concentration of microplastics, and the latter is related to hazardous chemicals that are associated with microplastics. Though data on microplastic exposure levels in environments and organisms have rapidly increased in recent decades, limited information is available on the chemicals that are associated with microplastics.

Microplastics can contain two types of chemicals: (i) additives and polymeric raw materials (e.g., monomers or oligomers) originating from the plastics, and (ii) chemicals absorbed from the surrounding ambience.

Additives are chemicals intentionally added during plastic production to give plastic qualities like color and transparency and to enhance the performance of plastic products to improve both the resistance to degradation by ozone, temperature, light radiation, mold, bacteria and humidity, and mechanical, thermal and electrical resistance [18].

They include inert or reinforcing fillers, plasticizers, antioxidants, UV stabilizers, lubricants, dyes and flame-retardants [18].

Among the charges, wood and rock flour, clay, kaolin, graphite, glass fibers, cotton flakes, jute or linen, cellulose pulp, etc. are used [18]. According to the definitions proposed by the American Society for Testing and Materials (ASTM-D-883), inert fillers are materials that are used to modify the strength, working and flow properties, and shrinkage of plastics, while the reinforcing ones, also called fillers, are defined as those with some strength properties that are significantly superior to those of the base resin [19]. These fillers (such as carbon black in rubber), which are mixed in with the polymer, result in an interface volume that is generated at the filler-resin contact surface. It is the superior properties of this interface layer that obtain increased modulus and mechanical properties such as impact strength or tensile strength in the composite polymer. As the effect is surface-related, the smaller particle sizes of fillers generally yield a better reinforcing effect. There are clays, silica, glass, chalk, talc, asbestos, alumina, rutile, carbon black, and carbon nanotubes [20].

Plasticizers are complex chemical products that have low vapor pressure, are insoluble in liquids, are chemically stable, and which are inserted between molecular chains to reduce their forces of physical attraction and increase their mobility, workability or distensibility. In this way, the flexibility and plasticity of a resin that is processed and the impact resistance of the product during use are increased [21].

Because plastics are particularly sensitive to the degrading action of light, UV radiation and heat, the stabilizers, have the function of preventing the thermal decomposition during the processing, as well as the oxidation and the consequent breaking of the polymeric chains (using phenols and aromatic amines). They mainly consist of organic or inorganic cadmium, barium, or lead salts [22].

Soluble or insoluble dyes are organic or inorganic substances in the form of fine powders that give the polymer the desired color; the soluble dyes maintain the transparency of the plastic, while the insoluble ones (pigments) cover it to make it opaque. Many inorganic pigments contain heavy metals, while organic pigments include various chromophoric families like azo pigments, phthalocyanine pigments, anthraquinone chromophores, and various other chromophores [23].

Lubricants and anti-adhesives are substances that facilitate the processing of plastic materials, improving their flow characteristics. They consist of calcium or magnesium stearates [24].

Flame retardants have the function of cooling or protecting a material in the event of a fire by preventing the oxidation of flammable gases or by forming a layer of ash. They are products that contain, for example, chlorine and bromine, which release by the action of the flame; phosphorus, which favours the transformation into coal; and aluminium hydroxide, which generates water vapour and CO₂ at 200 °C [24].

The additives, in almost all cases, are not chemically bound to the plastic polymer; only some flame retardants are polymerized with plastic molecules, becoming part of the polymeric chain [18].

Though these additives improve the properties of polymeric products, many of them are toxic, and their potential for the contamination of soil, air and water is high [18]. Studies on their impact on aquatic organisms with which they come into contact through macro and microplastics ingestion are still ongoing [25,26].

The combination of various kind of polymers of different sizes and shapes that are joined to the action of a large amount of additives that originate from plastics results in a cocktail of contaminants that not only alter the nature of plastic but can leach into the air, water, food, and, potentially, human body tissue during their use or their disposal, thus exposing us to several chemicals together.

2.1. Additives of Concern

Many substances that are classified as hazardous according to the EU regulation on classification and labelling [27] are present in everyday products as regular ingredients.

The toxicity of a substance is its ability to cause harmful effects. These effects can strike a single cell, a group of cells, an organ system, or the entire body. Chemicals that are considered most harmful are those that cause cancer, mutations to DNA, have toxic reproductive effects, are recalcitrant into the environment, are capable of building up in the food chain or bodies, and other harmful properties, such as disrupting hormones [28,29]. The internal organs that are most commonly affected are the liver, the kidneys, the heart, the nervous system (including the brain) and the reproductive system [29,30].

Among these chemicals, many routinely used to make plastics are dangerous. Bisphenol A (BPA), phthalates, as well as some of the brominated flame retardants, that are used to make household products and food packaging, have been proven to be endocrine disruptors that can damage human health if ingested or inhaled [30].

Endocrine-disrupting chemicals (EDCs), identified as substances that are exogenous to the human or animal organism, have hormonal activity that alters the homeostasis of the endocrine system, so they are of particular concern. These compounds interfere with the development of the endocrine system and affect the functioning of organs that respond to hormonal signals. The endocrinal and reproductive effects of endocrine disruptors may be a consequence of their ability to: (a) mimic natural hormones, (b) antagonize their action, (c) alter their pattern of synthesis and metabolism, or (d) modify the expressions of specific receptors [31–33].

Recent science has associated EDCs with various diseases and conditions, such as hormonal cancers (breast, prostate, testes), reproductive problems (genital malformations, infertility), metabolic disorders (diabetes, obesity), asthma, and neurodevelopmental conditions (learning disorders, autism spectrum disorders). Alongside the already shown scientific evidence, concern exists because of the rising levels of many diseases in Europe and worldwide. Additionally, the public is widely exposed to these chemicals from various sources [30].

2.1.1. BPA

BPA is a carbon-based synthetic compound with formula $C_{15}H_{16}O_2$ and a structure that contains two 4-hydroxyphenyl groups, which give to it a mild phenolic odor. It was first synthesized in the 1890s by the condensation of acetone with two equivalents of phenol [33].

BPA is a common plasticizer that is used in industry, especially in polycarbonate plastics manufacturing processes and food packaging [34,35].

BPA-based polycarbonate plastics are robust and stable because they can endure exposure to high temperatures and sustain high-impact collisions. These characteristics make them valuable as components of safety equipment and food packaging as they withstand heating in microwave ovens. Because it is a component of epoxy resins in protective coatings, such as the insides of aluminum and metal cans (as well as the lid closures of glass jars and bottles), BPA helps to extend the shelf life of food and beverage products [35,36]. Even if the compound is highly persistent, its instability within plastic products facilitates leaching, thus reporting a high prevalence in aquatic environments, particularly in landfill leachates [37,38].

In the early 1930s, Dodds and Lawson discovered that BPA was estrogenic [39], and, recently, the General Court of the EU confirmed that it is a ‘substance of serious concern’ for its hormonal disrupting properties on the human body. The Court upheld a previous decision by the European Chemicals Agency (ECHA) to identify the substances that are used in the manufacture of plastic products such as water bottles, food containers and receipts. It has been confirmed in several studies to be associated with obesity, cardiovascular disease, reproductive disorder, and breast cancer [30,40–42], and so it has gained increasing attention over the last decade, especially in terms of human safety. The contamination of food from BPA has been estimated to be responsible for 12,404 cases of childhood obesity and 33,863 cases of newly incident coronary heart disease in 2008. Another study estimated that BPA in

food contact materials and thermal paper was likely responsible for 42,400 obese four-year-olds in Europe (with health costs of 1.54 billion euros per year) [30]. It is still under discussion if microplastics are relevant pollutant vectors for uptake into organisms in comparison to further uptake pathways, e.g., via water or sediment particles, even if studies regarding the level of bisphenol A adhered on microplastics surface are very limited.

The first study that investigated the presence of BPA on microplastics sampled from the remote, open ocean and urban beaches from America and Europe, reported concentrations ranging from 1 to 729.9 ng/g [42]. In most locations, including urban coasts, only trace concentrations (<1 ng/g) of BPA were detected. Due to its lower hydrophobicity (log n-Octanol/Water Partition Coefficient (K_{ow}) = 3.40), the sorption of significant concentrations of BPA to marine plastics is unlikely. Indeed, in plastic fragments from remote coasts (730 ng/g) and open ocean fragments (283 ng/g), sporadic high concentrations of BPA were detected. Its utilization explains these higher BPA concentrations because it is a component of the plastic products and an additive. Indeed, BPA is a constituent monomer of polycarbonate plastic and epoxy resin and unreacted monomers in the plastics and resin and, degradation products from the polymers, can leach to the environment. Moreover, BPA is also used as additive to some plastics, and the leaching of BPA from commercial plastic products and dumped plastics can occur [42].

In the study of [43], the authors analyzed how the presence of non-suspended microplastics (polyamide particles (PA), which aggregated at the water surface or settled) modifies the acute effects of the environmental pollutant BPA on freshwater zooplankton (*Daphnia magna*). Daphnids are exposed to PA particles and BPA alone in a first step, and they are combined in a second step with a fixed concentration of PA and varying concentrations of BPA. All BPA concentrations used in the experiment greatly exceeded concentrations of the BPA that has been detected in rivers and lakes. The concentration of the PA particles used was also above the expected values in freshwater environments. There were two possible uptake pathways for BPA included in the experiments: direct uptake by BPA that was dissolved in water and vector-based uptake by the ingestion of PA particles that were loaded with BPA. The immobilization of daphnids was analyzed as an experimental endpoint to directly determine the influence of microplastics on pollutant toxicity. The results showed grazing by daphnids on settled PA particles from the bottom of the test beakers with high uptake rates that ensured the availability of PA particles, which could then potentially act as vectors for BPA. The analytical measurements showed that PA particles alone did not induce adverse effects, while the effects of BPA alone followed a typical dose-dependent manner. The sorption of BPA to PA particles before exposure led to a reduction of BPA in the aqueous phase. The combination of BPA and PA led to decreased immobilization, although the daphnids ingested PA particles that were loaded with BPA. These results showed the lower BPA body burden of daphnids in the presence of PA particles.

Another study [44] evaluated the retention of polyvinyl chloride (PVC) microplastics in sewage sludge during wastewater treatment. A model-based analysis indicated that PVC microplastics influenced the methane production from the anaerobic digestion of waste-activated sludge (WAS).

The presence of PVC microplastics (1-mm 20, 40, and 60 particles/g) inhibited methane production from WAS during anaerobic digestion to $90.6 \pm 0.3\%$, $80.5 \pm 0.1\%$, and $75.8 \pm 0.2\%$ of the control, respectively. Bisphenol A (BPA) leaching from PVC microplastics was the primary reason for the decreased methane production, causing significant ($p = 0.037$, 0.01 , and 0.004) inhibitory effects on the hydrolysis–acidification process. The results of relevant enzyme activities also confirmed this.

2.1.2. Phthalates

Phthalates are esters of phthalic acid (1,2-benzene dicarboxylic acid) on which there are two carbon chains of different lengths. Phthalates are a class of compounds that are produced in high quantities; they are the largest class of synthetic chemicals when considering production volume [45]. The authors of [46] reported that approximately 6,000,000 t/year phthalates are produced throughout the world. This production has remained quite constant for the past 20 years.

Their primary use is as plasticizers that are added to basic plastic material to impart specific qualities such as flexibility, pliability, and elasticity to plastic polymers [47].

They are colorless, odorless, oily liquids with low volatility and low water solubility [48]. Some phthalates have proven to be of concern due to their adverse effects to humans and ecosystems. Indeed, many phthalates are documented endocrine disruptors, and they are suspected of being endocrine disruptors, of affecting the reproduction of human beings, animals, or of being carcinogenic [49–51].

The problem is enhanced by the fact that several phthalates have similar modes of action, and that the overall risk, therefore, could increase when people and the environment are exposed to the different phthalates. Therefore, it is necessary to take the possible combination effects as a result of exposure to other phthalates and other substances into account [52]. There are many different types of phthalates, and there are indications that these do not have the same effects on the environment and human health.

Since 2007, there has been a ban in the EU on di(2-Ethylhexyl) phthalate (DEHP), dibutyl phthalate (DBP) and butyl-benzyl-phthalate (BBP) in all toys and childcare articles in concentrations above 0.1% (entry 51 of Annex XVII of the Regulation of the European Union (REACH) [53], as well as bans on diisononyl phthalate (DINP), diisodecyl phthalate (DIDP) and di-n-octyl phthalate (DNOP) in toys and childcare articles that can be placed in the mouth in concentrations above 0.1% [52,53]. DEHP is classified as reprotoxic category two and as T (toxic), while DBP is well-documented as having toxic effects on reproduction, as well as prenatal and postnatal development, in animals, and it is classified as reprotoxic category 3, as T (toxic), and as N (dangerous for the environment) [54]. DBP and diethyl phthalate (DEP) are the most widely used phthalates in medicinal products, even if toxicological effects have been observed in animals; as it cannot be ruled out that these findings have clinical relevance, the European Medicines Agency (EMA) is in the process of preparing limits for the use of DBP in medicines. Furthermore, the agency will probably also establish limits for the use of DEP and polyvinyl acetate phthalate (PVAP) in medicines [52].

Because of the potential risk of DEHP and DBP [55–58] and the potential hazard of the other phthalates, this group is considered as a hazard category [59].

With the publication of the new regulation [60] (EU) No. 2018/2005, which modifies Annex XVII of the REACH, the European Commission reinforces the limitations that are related to the presence of some phthalates in consumer products.

Limits on the presence of some phthalates were already present in the European legislation for the protection of consumers, but they were limited to “childcare articles,” that is “intended to reconcile the sleep or relaxation of children, their hygiene and their nutrients chin or sucking;” these include teats, pacifiers, baby bottles, food containers and cutlery for children, and teethers for babies.

The new regulation extends the limitation to the following four phthalates (DEHP, DBP, BBP, and diisobutyl phthalate (DIBP)) also to other product and user groups. In particular, these four phthalates cannot be present in an amount higher than 0.1% of the plastic material (the limit applies to the sum, not only to the single phthalates) or in any article realized (in whole or in part) in a plasticized material—that is, in one or more of the following six materials:

- polyvinyl chloride (PVC),
- polyvinylidene chloride (PVDC),
- polyvinyl acetate (PVA),
- polyurethanes
- any other polymer (including polymeric foams and rubber) except silicone rubber and natural latex coatings;
- surface coatings, non-slip coatings, finishing products, decals, prints;
- adhesives, sealants, inks and paints.

The limitations provided by the regulation will come into force from 7 July 2020, but with some exceptions, as specified in Annex I of the regulation.

The consultation of the European Union rapid alert system for product safety (RAPEX) showed that in 14 years (from 2005 to 2018), 1591 cases of harmful phthalates were reported in various products (of which about the 89% of Chinese origin), mostly toys 94% [61]. In 2018 alone, there were 206 reported cases of toys that contained harmful phthalates [62].

If we then consider the cases that were related to food containers (detected by the Rapid Alert System for Food and Feed (RASFF), which is similar to RAPEX but reserved for the food sector), we find that from 2007 to 2018, there were as many as 108 cases of phthalate-contamination in food containers, an issue which came with the risk of ingestion through food products [63].

A study conducted in 2011 in Harbin and Shanghai (China) [64] analyzed the presence of nine phthalate esters in eight categories of foodstuffs. DEHP was the primary compound that was found in most of the food samples, with concentrations that ranged from below the limit of quantification (LOQ) to 762 ng/g wet weight.

Among the more frequently mentioned endocrine disruptors (EDCs), phthalates are of particular concern due to their ubiquity and to the higher levels found in the environment compared to other EDCs [65–68]. The detection of phthalates in purely domestic wastewater (the waste of plastic households) has also highlighted the leaching of phthalates from plastic during use into the environment [67–69].

Due to the high octanol–water partition coefficients, the strong sorption of phthalate esters (PAEs) by soil and sediment organic matters, biochar, and other carbonaceous sorbents has been reported [70,71]. However, the sorption behavior of PAEs on microplastics has not been studied systematically. Considering the hydrophobic surface of microplastics, they may have high sorption capacity for PAEs, which may pose a high environmental threat [72].

Recently, the authors of [73] investigated the sorption behavior of two PAEs, diethyl phthalate (DEP) and dibutyl phthalate (DBP), on three types of microplastics with particle sizes of less than 75 μm (PVC: polyvinyl chloride; PE: polyethylene; and PS: polystyrene), and they demonstrated that hydrophobic interaction governed the partition mechanism. The sorption of the two PAEs on the three microplastics followed the order of $\text{PS} > \text{PE} > \text{PVC}$. For each kind of microplastics, the sorption of DBP was almost 100 times higher than that of DEP, demonstrating that the hydrophobic interaction dominated the partition. The results indicated too that the physical properties of microplastics did not play an essential role in their sorption behaviors. Moreover, on the one hand, solution pH (in the range of 2.0–7.0) and natural organic matter had no significant impact on the PAEs' sorption by microplastics, thus indicating that microplastics could accumulate hazardous PAEs in different aquatic environments. On the other hand, the presence of NaCl (0–600 mM) and CaCl_2 (0–300 mM) enhanced the sorption of both DEP and DBP on microplastics because of the salting-out effect.

The authors of [74] investigated organophosphorus esters (OPEs) and phthalic acid esters (PAEs) in beached microplastics that were collected from 28 coastal beaches of the Bohai and the Yellow Sea in north China. The analyzed microplastics included polyethylene (PE) pellets and fragments, polypropylene (PP) flakes and fragments, and polystyrene (PS) foams. Tris-(2-chloroethyl)-phosphate (TCEP), tris (1-chloro-2-propyl) phosphate (TCPP), and di-(2-ethylhexyl) phthalate (DEHP) were the three most predominant compounds found. The maximum $\Sigma 4$ OPEs concentration found was 84,595.9 ng/g^{-1} , almost three orders of magnitude higher than the maximum $\Sigma 9$ PAEs concentration observed. The PP flakes and PS foams contained the highest concentrations of the additives in contrast to the PE pellets, which contained the lowest concentrations. Moreover, the authors found that the spatial differences and compositional variation of the additives among the different microplastics suggested different origins and residence times in the coastal environment. These differences indicated that the characteristics of chemical additives might be a useful approach when tracing sources of microplastics in the environment.

2.1.3. Heavy Metals

Heavy metals are natural elements that have a relatively high atomic mass and a rather high density compared to water. Commonly, a density of at least 5 g/cm^{-3} defines a heavy metal and differentiates it from other “light” metals. Other, broader definitions for “heavy metals” require an atomic mass higher than 23 or an atomic number exceeding 20 [75–77]. However, these definitions are confusing and misleading due to the fact that they cause the inclusion of non-metals.

Therefore, some authors [78] have suggested that is better define “heavy metals” when referring to (1) transition elements; (2) rare earth elements, which can be subdivided into the lanthanides and the actinides, including La and Ac themselves; and (3) a heterogeneous group including the metal Bi, the elements that form amphoteric oxides (Al, Ga, In, Tl, Sn, Pb, Sb and Po), and the metalloids Ge, As and Te.

Even though heavy metals are naturally present in our environment (e.g., in the atmosphere, lithosphere, hydrosphere, and biosphere), their environmental contamination and their exposure to humans have mainly originated from various anthropogenic activities [77].

One of their primary uses is as additives in polymer products (e.g., colorants, flame-retardants, fillers, and stabilizers) (Table 1) during the production process to increase the properties of plastics.

Antimony oxide, aluminum oxide, and zinc borate are, for example, well-known flame retardants, as well as compounds that contain Cl and Br [18].

Metals such as Zn, Pb, Cr, Co, Cd and Ti are instead used as inorganic pigment-based colorants [22,79]; among these, colorants that contain cadmium and lead are used for all kinds of colored polymers, lending a coloration that goes from yellow to red. Chromium is mostly used for polymers such as PVC, polyethylene and polypropylene, whereas cobalt acetate is used in blue paints, particularly in the production of bottles that are made of polyethylene terephthalate.

Additionally, the presence of Ti in plastic products works as a TiO_2 indicator that is used both as a white pigment and as a UV stabilizer [80–82].

As part of the additives category, the stabilizers are generally used to prevent plastic degradation due to high temperatures, UV radiation, oxygen, and other kinds of atmospheric agents in order to lengthen product life. Among them, we again find compounds based on lead and cadmium, antimony trioxide and compounds based on Sn, which are mostly used in the making of doors and windows made of polyvinyl chloride.

Finally, although synthetic polymers are usually resistant to microbial attacks, some microorganisms can use some additives as sources of energy in the presence of water. This phenomenon can be prevented by adding, during the production of the polymer, biocides such as As, Sb and Sn [22].

According to the United States Environmental Protection Agency (USEPA) and the International Agency for Research on Cancer (IARC), arsenic, cadmium, chromium, lead and mercury are classified as “known” or “probable” human carcinogens based on evidences of epidemiological and experimental studies that have shown a correlation between exposure to those elements and cancer incidence on humans and animals [83].

Their toxicity depends on many different factors like dosage, how the subject is exposed to the element, and chemical species, as well as age, sex, genetics and the nutritional state of the exposed subject. A high concentration of heavy metals causes cellular and tissue damage, leading to a variety of adverse effects and human diseases [84–89]. Among metals, Al, Sb, As, Ba, Cd, Cr (II), Co, Cu, Pb, Hg, Ni, Se, Sn and V are defined metal–estrogens showing high affinity to estrogen receptors because they can mimic estrogen activation; for this reason, they are considered harmful and potentially linked with breast cancer [89–91].

Table 1. Main use of heavy metals as additives in polymer products and their effects on human health.

Heavy Metals	Additives	Type of Polymers	Effects on Human Health	References
Antimony (Sb)	Flame retardants and biocides	Various plastics	Metal–estrogen; breast cancer	[18,22,90]
Aluminum (Al)	Stabilizers, inorganic pigments and flame retardants.	PBT, PET, PE, PVC	Metal–estrogen; breast cancer	[18,22,90]
Zinc (Zn)	Heat stabilizers, flame retardants, anti-slip agents and inorganic pigments.	PVC, PE, PP	-	[18,22]
Bromine (Br)	Flame retardants	PBT, PE, PS, PP	Apoptosis and genotoxicity	[18,88]
Cadmium (Cd)	Heat stabilizers, UV stabilizers and inorganic pigments	PVC	Changes in metabolism of calcium, phosphorus and bone; osteomalacia and bone fractures in postmenopausal women; lipid peroxidation and in the promotion of carcinogenesis; cellular apoptosis; DNA methylation.	[18,22,77,79,92,93]
Copper (Cu)	Biocides	-	Formation of reactive oxygen species (ROS); inducing DNA strand breaks and oxidation.	[18,22,77]
Mercury (Hg)	Biocides	PU	Mutagen or carcinogen; induction of the disruption of DNA molecular structure and brain damage.	[11,22,77,95]
Arsenic (As)	Biocides	PVC, LDPE and polyesters	Congenital disabilities; Carcinogen: lung, skin, liver, bladder, kidneys; gastrointestinal damage; death.	[18,22,93]
Tin (Sn)	UV stabilizers and biocides	PU foam and PVC	Metal–estrogen; breast cancer; skin rashes; stomach complaints; nausea; vomiting, diarrhea; abdominal pain; headache and palpitations; potential clastogen.	[18,22,87,90]
Lead (Pb)	Heat stabilizers, UV stabilizers and inorganic pigments	PVC and all types of plastics, where red pigments are used	Anemia (less Hb); hypertension; miscarriages; disruption of nervous Systems; brain damage; infertility; oxidative stress and cell damage.	[18,22,77,79,90,93]
Titanium (Ti)	UV stabilizers and inorganic pigments	PVC	Cytotoxicity on human epithelial lung and colon cells.	[18,80,94]
Cobalt (Co)	Inorganic pigments	PET bottles	Formation of reactive oxygen species (ROS); neurological (e.g., hearing and visual impairment); cardiovascular and endocrine deficits.	[22,77,86]
Chrome (Cr)	Inorganic pigments	PVC, PE, PP	Allergic reactions to the body; nasal septum ulcer; severe cardiovascular, respiratory, hematological, gastrointestinal, renal, hepatic, and neurological effects and possibly death.	[77,79]
Barium (Ba)	Inorganic pigments and UV stabilizers	PVC	Metal–estrogen, breast cancer; cardiovascular and kidney diseases; metabolic, neurological, and mental disorders	[18,22,85,90]
Manganese (Mn)	Inorganic pigments	-	Neurodegenerative disorder	[18,84]

Cadmium has been suggested to take part in the promotion of cellular apoptosis and DNA methylation, in providing oxidative stress, in causing damage to DNA, in increasing bone fractures in postmenopausal women, and in lipid peroxidation [77,92,93].

Titanium oxide, for example, which is used as an additive in many plastics products, has been shown to generate cytotoxicity on human epithelial lung and colon cells [94]. Lead is responsible for a variety of consequences on human health such as affecting the DNA repair system, producing ROS (reactive oxygen species), modifying the genes that are responsible for the cellular tumor regulation, and various effects on the central nervous system, including the damage of motor and cognitive functions, convulsions, coma, and death. Arsenic contamination could cause cancer to the urinary bladder, lungs, liver and kidneys. As for mercury, it affects two target organs: the central nervous system and the kidney. The toxicity of the elemental mercury is due to mercuric mercury. Inflated elemental mercury vapors promptly pass through the blood–brain barrier, and the consequent oxidation in mercuric mercury starts a connection with brain macromolecules [95].

The exposure of living organisms to such inorganic pollutants is ever increasing if we consider the interactions of microplastics, vectors themselves of metals, with biota [3,96].

Though polymers were considered to be inert towards metals in the past [97], great attention has recently been paid to better understanding the interaction between heavy metals and microplastics [98–108].

In this regard, earlier studies such as [98] investigated the ability of virgin and aged microplastics to adsorb metals. Plastic production pellets were collected from beaches and sediment flats of south-west England and revealed variable concentrations of trace metals (Cr, Co, Ni, Cu, Zn, Cd and Pb) that, in some cases, exceeded the concentrations that were reported for local estuarine sediments. The same authors studied the rates and mechanisms of metals that were associated with virgin and beached polyethylene pellets in a laboratory-scale experiment. Trace metals were shown to adsorb to both virgin and beached pellets but with a higher rate on aged pellets. Presumably, metal adsorption proceeds through interactions between divalent cations (e.g., Cu^{2+} , Cd^{2+} , and Pb^{2+}) and oxyanions (e.g., $\text{Cr}_2\text{O}_4^{2-}$) with charged or polar regions of the plastic surface (effected by imperfections and the presence of charged contaminants and additives, for example), and via non-specific interactions between neutral metalorganic complexes and the hydrophobic surface of the bulk plastic medium. Aged beached pellets accumulate trace metals to a significantly greater extent, with equilibrium partition coefficients ranging from about 4 mL/g^{-1} (Co) to 220 mL/g^{-1} (Cr). Its reactivity is enhanced by changes to the polymer itself, as well as the presence of biofilms and chemical precipitates that enhance the critical role of plastic as a vehicle for the transport of metals in the marine environment.

In the study of [101], the authors examined, over the 14 days of the experiment, the adsorption of two heavy metals, copper (Cu) and zinc (Zn), that were leached from an antifouling paint to virgin polystyrene (PS) beads and aged polyvinyl chloride (PVC) fragments in seawater. They demonstrated that heavy metals were released from the antifouling paint to the water, and both microplastic types adsorbed the two heavy metals. The adsorption of Cu was significantly higher in PVC fragments than in PS, probably due to higher surface area and polarity of PVC. The concentrations of Cu and Zn increased significantly on PVC and PS throughout the experiment except for Zn on PS.

However, the absorption/desorption processes that can occur naturally in the environment are quite complex and present a high variability [109]. Indeed, several factors and variables can influence the interaction between metals and microplastics, such as the alteration of the plastic surface exposed to atmospheric agents, the increased roughness of aged particles compared to virgin materials, and the faster decomposition of darker particles [5]. All these components accelerate the degradation processes of microplastics, creating anionic and active sites that increase the interaction of particles with heavy metals [110].

Other significant variables to be considered responsible for increasing the interaction between microplastics and inorganic pollutants are related to pH, salinity variations, photo-oxidative erosion, the formation of biogenic biofilm, enhanced polymer polarity and plastic porosity [98,99,109,111,112].

The authors of [111] observed the Pb absorption capacity on nanoplastics (particles that are unintentionally produced within the size range from 1 to 1000 nm [113]) that were produced from microplastics that were collected on a beach exposed to the North Atlantic Gyre. Lead (II) adsorption kinetics, isotherm, and pH-edge analyses were carried out. The sorption reached a steady-state after around 200 min. The maximum sorption capacity varied between 97% and 78.5% for both tested Pb concentrations. Chemical reactions controlled lead (II) adsorption kinetics with the nanoplastics surface and to a lesser extent by intraparticle diffusion. Adsorption isotherm modelling demonstrated that nanoplastics were strong adsorbents that were equivalent to hydrous ferric oxides such as ferrihydrite. The adsorption was dependent on pH in response to the Pb(II) adsorption by the oxygenated binding sites that were developed on the account of the surface UV oxidation under environmental conditions. They could be able to compete with Fe or humic colloids for Pb binding, due to their amounts and specific areas, becoming efficient vectors of Pb and probably of many other metals.

Therefore, microplastics, once spread into the environment, with their load of intrinsic (additives) and extrinsic (environmental) heavy metals, can be conveyed into the food web to reach aquatic organisms [114–119] and then humans [120–122].

In this regard, the study of [123] pointed out the potential ability of metals that are present on marine microplastics in determining the co-selection of antibiotic-resistant human pathogens, representing a severe threat to humans that are exposed to the marine environment or even to seafood. Metals such as mercury, lead, zinc, copper and cadmium are accumulating to critical concentration in the environment and triggering the co-selection of antibiotic resistance in bacteria. In the marine environment, persistent pollutants like microplastics are recognized as a vector for the proliferation of metal/antibiotics, and human pathogens and horizontal gene transference between the phylogenetically distinct microbes that are present on microplastics are much faster than free-living microbes. Therefore, microplastics are an emerging global health threat [112].

However, studies on the impact of microplastics on human health are all in the early stages and need to be further developed [117,124].

2.1.4. Flame-Retardants

Flame retardants (FRs) are chemical compounds (Figure 4) that are capable of raising the flashpoint of the materials in which they are added. The main function of these molecules is, therefore, to prevent fires [125]. Flame retardants are divided into reactive and additive flame retardants according to their use. On the one hand, reactive chemicals are covalently bonded to polymers and are therefore less likely to reach the environment until the product is decomposed or burnt. The additive compounds, on the other hand, are only mixed with or dissolved in the material and can more easily migrate out of the product. Recently, over one hundred and forty types of flame retardants were counted, of which approximately seventy were found to belong to the brominated flame retardant (BFR) category. A first classification can be made based on their chemical nature—that is, organic or inorganic flame retardants:

- **Inorganic Flame Retardants:**

Antimony Trioxide
Aluminum Hydroxide

- **Organic Flame Retardants:**

Tris (2,3-dibromopropyl) phosphate
Short-chain chlorinated paraffin (10–13 carbon atoms) (SCCPs)
Medium-chain chlorinated paraffin (14–17 carbon atoms) (MCCPs)
Long-chain chlorinated paraffin (> 18 carbon atoms) (LCCPs)
Polybrominated diphenyl (PBB)
Polybrominated diphenyl Ethers (PBDEs)

Hexabromocyclododecanes (HBrCDs)
Tetrabromobisphenol_A (TBrBP_A)

Figure 4. Chemical structure of some classes of halogenated flame retardants.

Inorganic flame retardants act through different chemical and physical mechanisms [126]. With the application of heat, they can release water, they can release fire retardant gases that suffocate the flames, or, in other cases, they can form a protective film that protects the material in which they are inserted. Most often, inorganic flame retardants are used as adjuvants of organic ones. This is the case of antimony trioxide, which is used together with brominated flame retardants and acts as a catalyst in the decomposition reactions of BFRs [127]. Phosphorus-based flame retardants act in the solid phase [128]. With the application of heat, they form a polymer of phosphoric acid that carbonizes the material, blocking the pyrolysis process [128]. Though with some difference, the mechanism of action of organic flame retardants is the same. With the application of heat, they decompose even before the matrix that contains them, thus preventing the formation of flammable gases. In more detail, the halogens that are released by said molecules can react with the radicals H and OH, removing them from the chain reactions that are triggered during the combustion processes [129]. The critical factor that determines the goodness of the preventive action of these additives is their thermal stability, within the material that hosts them. If a retardant decomposes or evaporates too above or below the combustion temperature of the host material, its action will be ineffective. The brominated flame retardants decompose at a temperature of approximately 50 °C below the combustion temperature of the matrices to which they are inserted, therefore making them particularly useful for fire prevention [130].

The use of chemical additives to make materials fireproof is not a recent phenomenon. The ancient Egyptians used hydrated potassium aluminum sulphate ($KAl(SO_4)_2 \cdot 12H_2O$) to treat wood [131]. Following, Gay Lussac described a technique to protect theatre fabrics from fire through treatments with mixes of ammonium phosphate, ammonium chloride, and borax [132]. Today, the main fields of use of flame retardants concern the production of electrical materials, electronic materials, construction, textiles and transport (Figure 5). The massive growth in the production of plastic polymers has led to a substantial increase in the production of flame retardants. For example, in 1965, only 10% of bromine was used for the production of brominated flame retardants; this percentage became 40% in 1996 [133]. The global production of BFRs (as in the sum of Europe, Asia and the United States) increased from 106,000 metric tons in 1989 to 2,035,000 metric tons in 1999 [134].

Figure 5. Greater fields of use of brominated flame retardants (BFRs) (Source data: [135]).

The high concentrations of FRs that are found in plastic products are because these molecules (distinctly lipophilic) not only adsorb onto the surface of plastics and microplastics but also are present inside them because they are added as additives during the plastic production process [135].

Given the chemical inertia and marked lipophilicity of flame retardants, it is easy to intuit their rapid bioaccumulation. Different concentrations of PBDEs have been detected in various matrices including human milk, article glaciers, domestic dust, and, obviously, in sludge that is derived from water purification plants [136]. The considerable accumulation in this sludge deserves special attention if one thinks of the common practice of reusing it as an organic soil improver in agriculture. Another widespread practice of sludge disposal is its incineration. Several authors have already shown that the incomplete combustion of PBDEs leads to the formation of highly toxic species such as polybromodibenzofuranes (PBDF) and polybromodibenzodioxins (PBDD) [137]. In this regard, BFRs have been classified as “persisting organic pollutants” (POPs). The risk assessment made by the European community has shown that some of these molecules are toxic, suspected to be carcinogenic, and actively act on the endocrine system (endocrine disruptor).

Regarding PBDEs, the European community has banned the use of pentaBDE and octaBDE. This ban is because they are classified as toxic for reproduction [138]. DecaBDE will not be classified as a dangerous substance according to the European Directive 67/548/EEC because it is not toxic to human health or the environment. Several papers [139] have highlighted the immunotoxic effect of tetrabromobisphenol A (TBBP_A). Regarding HBrCDs, there is evidence [140] that they interfere with thyroid hormones.

Just like many other hydrophobic contaminants, evidence of attachment of PBDEs onto microplastics from marine environment has been highlighted in recent years [42,141,142], and the assimilation of these pollutants by organisms that ingest microplastics is highly probable [141,143,144]. Different levels of PBDE concentrations on microplastic samples have been observed based on polymer type and local anthropogenic activities. For example, the study of [42] underlined the presence of a much higher concentration of total-PBDEs that were analyzed on PP microplastics (9909 ng/g) than on PE samples (0.3 ng/g), with the most significant values being reported in open seas areas compared to remote locations. BDE-209 is one common PBDE congener that usually occurs in very high concentrations, and its low diffusion coefficient in LDPE implies a consideration when taking into account the risk that is posed by microplastic particle ingestion by marine organisms [42].

Indeed, amphipods have demonstrated the ability to assimilate PBDEs that are derived from microplastics and have shown a greater uptake for higher-brominated congeners (BDE-154 and -153 compared to BDE-28 and -47) [143]. In the cited study, amphipods (*Allorchestes compressa*) that were exposed to microplastics that were isolated from a commercial facial cleansing soap ingested ≤ 45 particles per animal and evacuated them within 36 h. Amphipods were exposed to polybrominated diphenyl ether (PBDEs) congeners (BDE-28, -47, -99, -100, -153, -154, and -183) in the presence or absence of microplastics. The results demonstrated that PBDEs that were derived from microplastics

could be assimilated into the tissue of a marine amphipod. Microplastics reduced PBDE uptake compared to controls, but they caused a greater proportional uptake of higher-brominated congeners such as BDE-154 and -153, as compared to BDE-28 and -47. The study demonstrated that microplastics could transfer PBDEs into a marine organism by acting as a vector for the assimilation of POPs into marine organisms; thus, they pose a risk of contaminating aquatic food chains.

Another study [145] analyzed the feed of a typical commercial fish, the seabass, based on their absorption of microplastic-containing contaminants (PCBs and PBDEs). The study investigated how combinations of halogenated contaminants and microplastics that are associated with feed can alter toxicokinetics in European seabass and therefore affect the fish. Microplastic particles (2%) were added to the feed either with sorbed contaminants or as a mixture of clean microplastics and chemical contaminants, and they were then compared to a feed that contained contaminants without microplastics. For the contaminated microplastic diet, the accumulation of polychlorinated biphenyls (PCBs) and brominated flame retardants (BFRs) in fish were significantly higher, increasing up to 40 days of accumulation and then reversing to values that were comparable to the other diets at the end of accumulation.

The significant gene expression results of the liver (cyp1a, il1 β , and gst α) after 40 days of exposure indicated that microplastics might indeed worsen the toxic effects (liver metabolism, immune system, oxidative stress) of some chemical contaminants that are sorbed to microplastics.

Moreover, on the one hand, at the end of the accumulation period, microplastics increased the bioavailability of the sorbed contaminants, showing a quadratic accumulation of all the 12 contaminants that were present on the microplastics. On the other hand, the metabolism of BDE99 to BDE47 (by debromination) in seabass was rather fast, and unlike other pollutants, this metabolism was unaffected by the presence of microplastics.

3. Effects of Micro and Nanoplastics on Human Health

A recent report from the “World Health Organization” [146] emphasized the ubiquitous microplastics presence in the environment and aroused great concern regarding the exposition and effects of nano and microplastics on human health [122,147–150]. One of the major nano and microplastic entry points into the human system is represented by the ingestion of contaminated food [8,151–153]. In a recent study conducted by [154], 0.44 MPs/g of nano and microplastics were found in sugar, 0.11 MPs/g were found in salt, 0.03 MPs/g were found in alcohol, and 0.09 MPs/g were found in bottled water. Humans could also assume an estimated intake of 80 g per day of microplastics via plants (fruits and vegetable) that accumulate MPs through uptake from polluted soil [155].

The presence of microplastics in marine species for human consumption (fish, bivalves and crustaceans) is now well-known [156]. As an example, in *Mytilus edulis* and *Mytilus galloprovincialis* of five European countries, the microplastic number has been found to fluctuate from 3 to 5 fibers per 10 g of mussels [116].

Therefore, following exposure via diet, uptake in humans is plausible, as evidenced by the capacity for synthetic particles smaller than 150 μm to cross the gastrointestinal epithelium in mammalian bodies, which causes systemic exposure. However, scientists speculate that only 0.3% of these particles are expected to be absorbed, while a lower fraction (0.1%) that contains particles that are bigger than 10 μm should be capable of reaching both organs and cellular membranes and passing through the blood–brain barrier and placenta [117]. Exposure concentrations are predicted to be low, although data about micro and nanoplastics into the environment are still limited due to the analytical and technical complications to extract, characterize, and quantify them from environmental matrices [157].

Once ingested, particles smaller than 2.5 μm can enter the gastrointestinal tract (Figure 6) through endocytosis by M cells (specialized epithelial cells of the mucosa-associated lymphoid tissues) of Peyer’s patches. M cells transport particles from the intestinal lumen to the mucosal lymphoid tissues or through the paracellular persorption. Persorption consists of mechanical kneading of solid particles through gaps that are located in the single-layer epithelium at the villus tips of the gastrointestinal

tract (desquamation zones) and into the circulatory system. The resulting toxicity is via inflammation due to the persistent nature of microplastics, as well as their unique properties such as hydrophobicity and chemical composition, and it is supposed to have an accumulative effect that is dependent on dose [151]. This assumption, regarding levels of microplastics in men at a gastro-intestinal level, was further confirmed by the finding of microplastics into human stools: Twenty plastic particles, mostly PE and PP (ranging in size between 5 and 500 μm), were found for every 10 g of stool [158,159]. Indeed, the human excretory system should be responsible for removing up to 90% of micro and nanoplastics ingested [156].

Figure 6. Overview of scientific studies focused on the effects of micro and nanoplastics on human health. Colored squares represent pollutants (organic and inorganic) that could be present in environmental matrices (free or associated with micro and nanoplastics) and that could enter into the human body through different entry routes.

Another microplastics entry point to the human body is the aerial one (Figure 6) through inhalation [160,161]. The authors of [162] showed how the ingestion of synthetic fibers from mussel consumption is less than that of the ones that are inhaled from domestic dust during the same meal. The authors of [151] reported finding 18 fibers and four fragments/L of rain during precipitation events. Microplastics are carried by the wind or from atmospheric depositions and could also result from the erosion of agricultural and fertilized lands, dried sludges, and products from wastewater treatment, synthetic clothes fabric, industrial emissions, road-dust, marine aerosol. This spread could lead to respiratory distress, cytotoxic and inflammatory effects, and autoimmune diseases in men [7,128,131,135,163–165]. Moreover, the human lung has a quite wide alveolation surface of ca. 150 m², with a very thin tissue barrier that is smaller than 1 μm and which could allow nanoparticles to penetrate the bloodstream and all human body [150]. Polystyrene particles of the size 50 nm have led to genotoxic and cytotoxic effects on pulmonary epithelial cells and macrophages (Calu-3 and THP-1) [166]. More widely, the response to inhaled particles, depending on differences on individual

metabolism and susceptibility, may be expressed as immediate bronchial reactions (asthma-like), diffuse interstitial fibrosis and granulomas with fiber inclusions (extrinsic allergic alveolitis, chronic pneumonia), inflammatory and fibrotic changes in the bronchial and peribronchial tissue (chronic bronchitis), and interalveolar septa lesions (pneumothorax) [7]. For example, similar effects have been registered in workers of the textile industry in close contact to nylon, polyester, polyolefin and acrylic fibers. The low deterioration of microfibers has been found in patients suffering from pulmonary cancer as a confirmation of the bio-persistence of these synthetic particles. In addition to bio-persistence, fiber size has an impact in their toxicity [151]; for example, fibers of 15–20 μm cannot be successfully removed from macrophages to the lungs. Additionally, in [167], the toxicity of smaller-sized polystyrene nanoparticles (25 nm in diameter), which induced lower cell viability, cell cycle arrest in the S phase, the transcription of the activated inflammatory gene, and changed protein expression that was associated with the cell cycle and pro-apoptosis, was demonstrated. Not to be overlooked is the potential transmission of microorganisms through the microplastics that are present in the air. By attaching to microplastic surfaces in order to be protected from UV radiations, microorganisms could reach the lung and become another threat of infections to human health [7].

The last exposure pathway of microplastics to the human body could be skin contact (Figure 6) through water while washing or while using scrubs and cosmetics that contain micro and nanoplastics.

However, the penetration of the corneous layer is limited to particles lower than 100 nm, so it is unlikely that microplastics absorption could occur through the skin; on the contrary, nanoplastics absorption is more probable [122].

Though plastic is considered an inert material, there is a broad range of properties that characterize microplastics, such as size, shape, chemical composition, and hydrophobicity, that could cause harm and influence the cytotoxicity of particles to cells and tissues [151].

The increased surface area/volume ratio of microplastics, combined with their hydrophobicity, translates to a high affinity to a broad range of hydrophobic and persistent organic pollutants, antibiotics, and heavy metals that could be introduced in the human body by microplastics uptake.

In regard to heavy metals, an in-vitro study was conducted about chromium (Cr) absorption/desorption behavior in the human digestive system considering non-degradable MP types (polyethylene (PE), polypropylene (PP), polyvinylchloride (PVC), and polystyrene (PS)) and degradable MPs (polylactic, PLA). The results showed the ability to release Cr (VI) and Cr (III) from MPs into the digestive-gastric phase thanks to stomach acid conditions that stimulated the process [168].

The interactions between microplastics/nanoplastics and other human organs are still being tested, but their possible effects can be assessed based on human absorption models of nanomaterials that are produced by various industrial production processes. In the studies of [169,170], the ability of nanoparticles in polystyrene to cross the placental barrier and the primary human renal cortical epithelial (HRCE) cells was demonstrated.

The use of metal nanoparticles (NPs) (AgNP and AuNP, ZrO₂NPs, CeO₂NPs, TiO₂NPs, and Al₂O₃NPs), carbon nanomaterials (C60 fullerene, graphene) and polyethylene (PE) and polystyrene (PS) microplastics has demonstrated that cytotoxic effects are induced on T98G and HeLa cell lines (human brain and epithelial cells) [171]. Additionally, the use of polypropylene (PP) particles has shown different but harmful effects on various cell lines, based on the size (~20 μm and 25–200 μm) and the different concentrations used in the various tests. Therefore, the interaction of microplastics with humans can produce cytotoxicity, hypersensitivity, unwanted immune responses, and acute responses like hemolysis, thus representing a potential risk to human health [172].

Recent in-vitro studies about effects of plastics on the human body have mostly used engineered nanoplastics that can influence their absorption and also the translocation and production of ROS due to their dimension, charge and shape [148,150,173–176]. In fact, in the study [174], the interaction between positively-charged nanoparticles of polystyrene (60 nm) and the secretion film of the gastrointestinal epithelium (first physical barrier after digestion) was analyzed. Nanoplastics showed a strong ability to interact with the secretion film, to influence cellular vitality, and to induce apoptosis in the intestinal

epithelial cell lines LS174T, HT-29 and Caco-2. Those cytotoxic effects were already observed in the study of [177], which was carried out on adenocarcinoma colon–rectal human differentiated cells, Caco-2, by using polystyrene nanoparticles of 20 and 40 nm.

4. Conclusions

The intake of microplastics by humans is by now quite evident. The entry point may be through ingestion (through contaminated food or via trophic transfer), through inhalation, or through skin contact.

Following the intake of microplastics into the human body, their fate and effects are still controversial and not well known. Only microplastics smaller than 20 µm should be able to penetrate organs, and those with a size of about 10 µm should be able to access all organs, cross cell membranes, cross the blood–brain barrier, and enter the placenta, assuming that a distribution of particles in secondary tissues, such as the liver, muscles, and the brain is possible. Not enough information is available to fully understand the implications of microplastics for human health; however, effects may potentially be due to their physical properties (size, shape, and length), chemical properties (presence of additives and polymer type), concentration, or microbial biofilm growth.

How toxic chemicals adsorb/desorb onto/from microplastics is not well known, but plausible mechanisms include hydrophobic interactions, pH variations, the ageing of particles, and polymer composition. Furthermore, not enough studies have fully explained the primary sources of pollutants that are present on microplastics and whether their origin is extrinsic from the surrounding ambient space, intrinsic from the plastic itself, or, more probably, from a combination of both and from a continuous and dynamic process of absorption and desorption that is related to the spread of the particles into the environment and to their consequent exposure to weathering.

Diane Meisenhelter

I am writing to you to urge the Ecology Department to deny the Shorelines permit for the NWIW Kalama methanol refinery.]Your own analysis has shown that the project could produce up to 4.6 million tons of carbon pollution annually for decades to come which is totally not in line with Washington's climate goals and more importantly will contribute immensely to global warming making it more difficult to keep temperature's from rising to catastrophic levels. Instead of focusing on this real-world known pollution that will come from the facility, the SEIS relies on a flawed, speculative analysis claiming that methanol might replace dirtier energy sources, be burned overseas(which still contributes to global warming) or "only" be used to manufacture plastics (which has a whole other set of horrific environmental consequences that the SEIS does not adequately address). Ecology should not use these specious attempts and contortions to speculate on lower levels of actual pollution but instead should focus on helping to create a true low-carbon future that we so desperately need to mitigate the worst effects of climate chaos that are already becoming so visible in the Pacific NW and around the country. Instead the Ecology Department needs to be working towards a different type of alternative instead of promoting a false choice between various fossil fuel evils-- a future with both energy and transportation not relying on high-carbon fossil fuels but on the types of low-carbon solutions currently being developed. Your speculations could have focused on this instead of those described above, but really speculations have no place in real life or death decisions like this.

Ecology should decide based on the real, assured, climate catastrophe pollution that will occur from fracking gas, producing and refining methanol, and burning or using methanol to make plastics as well as the other environmental impacts of these actions. NWIW provides few if any details on the actual "voluntary" mitigation actions they might take or how they will ensure "full-mitigation" as claimed. Few descriptions of the actual processes, projects or measures to address the gigantic impacts from the greenhouse gasses that will be emitted are provided.

Finally, the SEIS continues to use low estimates of methane leakage as opposed to relying on the most recent, thorough, comprehensive analyses that have been done of actual leakage rates in British Columbia, Alberta, and the United States using top-down as well as bottom-up methodologies.

Please deny the permits for this problematic and potentially life-threatening project, our children and grandchildren's will thank-you.

Eileen Fromer

I'm actually surprised that the Department of Ecology continues to rationalize how the Kalama Methanol Refinery will cut greenhouse gasses and prevent greenhouse gas emissions by setting up a 'straw man' - the use of coal for fuel - that methanol might replace. We are in the midst of a climate crisis and this is no time to continue emitting methane gasses.

I urge you to deny the Kalama SEIS.

Jared Howe

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Mr. Jared Howe

Jennifer Calvert

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. There is every reason not to let this project go forward and absolutely no reason, apart from capitalism and making money, to allow it to go forward.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

Joy Garrison

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Joy Garrison

Comments for committee hearing on Kalama Manufacturing & Marine Export Facility

I have been following development of the Kalama Manufacturing & Marine Export Facility since 2018. More recently I've also been following public announcements of other methanol production facilities in other regions of the world. The proposed Kalama facility will produce 10,000 metric tonnes of methanol daily. In just the last eight months, construction of five methanol plants have been announced or begun operations in countries around the world with production totaling more than 3 times the Kalama figure.

- 5,225 mtpd from natural gas in Turkmenistan
- 5,479 mtpd from coal in Indonesia
- 6,600 mtpd from coal in China
- 7,000 mtpd natural gas in Iran
- 7,200 mtpd from coal in China
- A total of 31,704 new tonnes of methanol to be produced each day worldwide. And that's just since January.

The swell of methanol production worldwide is evidence that—contrary to wishes expressed before this committee—the world's demand for fossil-sourced methanol isn't going anywhere but up. As long as we want dashboards in our cars, cases for our computers and TVs, carpeting under our feet, upholstery on our furniture, and clothes on our backs, we unavoidably want methanol.

Many listeners are taking notes of this committee proceedings. Look at the pen in your hand. Unless you bought a very expensive one, that pen has a plastic body and a plastic ink cartridge. That pen started as methanol, as do a thousand other products we handle throughout the year. To vilify the production of methanol—to say we don't want, don't need it, or that it must somehow just go away—is naïve. As a technological society, methanol will be with us for generations.

But what we can do, and what we must do, is use our technology to ameliorate the climate damaging, greenhouse gas co-product of methanol production. The proposed Kalama facility does this like none other in the world.

The planet doesn't care where greenhouse gasses emanate. The atmosphere doesn't look to see where the carbon dioxide is released and say, "I'm going to punish you there." Climate change doesn't happen in the sky over Washington, or China or Turkmenistan. It happens everywhere. That's why it's "global warming." Greenhouse gases are evenly dispersed throughout the atmosphere everywhere. It's not the location of emission that matters, it's the cumulative amount from everywhere.

The five newly announced methanol plants will be constructed in countries with far less emissions regulations and climate protection than in the United States, perhaps none at all. Greenhouse gas emissions from these foreign-built facilities will be 6, or 10, or 12 million tonnes per year greater than from the conscientiously conceived and technologically superior Kalama facility.

Rather than seeing the Kalama Manufacturing & Marine Export Facility as a detriment, we can and should hold it up as an exemplar to the world. In an era when the United States is tragically, embarrassingly backing away from our commitment to international climate protection, America's Pacific Northwest, the State of Washington, and the City of Kalama can proudly say, look at us, look at how we're doing it. Follow our lead.

Thank you for your attention.

Lisa Harrington

Dear WA Department of Ecology,

Columbia Riverkeeper

Director Watson, Heather, and Rich,

I've pasted below our quick policy thoughts on the displacement theory presented in the Kalama methanol EIS. We will submit technical comments, but I wanted to distill and highlight this policy concern. We appreciated the chance to discuss this with Rich, Stu, and others. Hope everyone is staying safe.

Kalama methanol: Washington should not adopt a dangerous new climate policy

The draft SSEIS for the world's largest fracked gas-to-methanol refinery could back Washington into a dangerous new climate policy: the displacement theory.

Northwest Innovation Works suggests that building a new refinery, which will emit 4.6 million tons of carbon pollution per year, is good for our climate because gas-derived methanol will displace coal-derived methanol. Consultants hired by the Department of Ecology repeated the displacement theory in the draft SSEIS. Washington should reject the displacement theory as unreliable and contrary to the state's rational, hopeful climate policies. Here's why:

1. Fracked gas is not the answer

This goes without saying: fracked gas is not a bridge fuel. The real comparison is not coal versus gas, but fracked gas versus clean energy and fuels.

2. The displacement theory takes a bleak view of humanity

To justify the displacement theory, the SSEIS assumes that society will have no technological advances in clean energy or fuels, the Paris Climate Accords will fail, and China will do nothing to meet its pledge to be carbon neutral by 2060. In other words, the world will give up on stopping climate change. Washington should reject this bleak and dangerous outlook. We rely on Washington's audacity to tackle the climate crisis and provide hope for the future.

3. Washington has already rejected the displacement theory

Any fossil fuel developer can fabricate worse alternatives. Backers of the Millennium coal terminal in Longview claimed their coal would displace dirtier coal in Asia. Tesoro claimed its "lower-carbon Bakken crude" in Vancouver would displace dirtier oil. Washington leaders did not take the bait. Why? Displacement is speculative and unenforceable. And, most importantly, our climate cannot afford to lock in fossil fuel infrastructure for the next 50 years. If Washington adopts the displacement theory for Kalama methanol, this creates a precedent that invites new fossil fuel projects.

4. Where are the electric cars?

The SSEIS presents a false choice: is a gas-derived or coal-derived fuel better? The consultants

ignore electric vehicles and other technologies that compete with methanol. Does Washington want to lock in fossil fuels that will directly compete with clean technologies?

5. Choose a brighter future

The displacement theory is antithetical to everything our state is working to accomplish. Washington is innovating new technologies and fighting for new policies. We are creating positive change, not passively accepting a dark future. These words from Governor Inslee give us hope:

“I cannot in good conscience support continued construction of a liquefied natural gas plant in Tacoma or a methanol production facility in Kalama.”

“I decided that on my final day on Earth, I want to be able to look at my three grandchildren and tell them that I did everything humanly possible to save them from this enormous cataclysm of the climate crisis.”

Recommendation: Do not adopt the displacement theory in the Kalama methanol final EIS. Acknowledge in the final EIS that changes in technology, regulations, and trade policies will occur over the next 40 years so the “no changes” assumption underlying the displacement theory is unreliable and incorrect.

Brett VandenHeuvel (he/him) | Executive Director | Columbia Riverkeeper

Sharon Wilson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Our actions up to this point have been causing a serious decline in the health of ecosystems upon which all of us depend; we must change our course to build a livable future for humans and other living beings.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Karol Long

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Judith Rollins

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Julie Glover

When fully analyzing greenhouse gas emissions from the proposed Kalama methanol facility, looking at impacts from upstream emissions (such as the greenhouse gases that escape from natural gas wells and pipelines), direct and indirect emissions produced at the facility itself and downstream emissions from transporting the methanol to its intended destination in China, it is VERY CLEAR that Northwest Innovation Works SHOULD NOT develop and operate a natural gas-to-methanol production plant and storage facilities on approximately 90 acres at the Port of Kalama. LOOK FOLKS, THIS WHOLE PROJECT IS JUST TOO DANGEROUS! FORGET ABOUT IT, PLEASE PLEASE PLEASE!!!!

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

The elected officials so welcomed this refinery because most of them get their information from the local newspaper and do not have the time to get all the facts.

The sales pitch that NWIW to the leadership and the citizens was awe-inspiring. It would fix all of their concerns and problems that Cowlitz County had. Thousands of jobs, millions in the tax coffers, job training, heck- it even would be great for the environment. They were fed the propaganda sent out by the newspaper. If it was good, it was front-page news; it was buried later in the story if it was bad. If it was awful, the information wasn't even printed.

The following news stories were never printed in the local paper. Most of these articles and events were only brought to the surface by investigations by people and organizations who care for the environment and their friends' and neighbors' health and well-being.

Not one word was mentioned about BP, the co-partner with CAS that were the original backers of NW Innovation Works, and how they pulled out years ago. This should have been an eye-opening event, but not a blurb. After BP's pullout, another investor of NWIW was The Noble Group. The Noble Group Ltd was embroiled in an accounting fraud controversy scheme and was delisted from the Singapore Stock Exchange, nothing in the news to these warning signs.

The locals were never informed why NWIW pulled out of Tacoma and how the same concerns that stopped that project should have stopped this one. There wasn't any news of how NWIW dropped out of their lease at Port Westward and now on the waiting list for another property and will occupy a site only if the zoning changes to allow heavy industry from farming.

Why did so much of the Cowlitz County Cares Act fund money go to Pan Pacific Energy, the parent company of NWIW? Why did it need hundreds of thousands of dollars to survive? Are they really backed by the Chinese government and a large investment group?

So many people that were surprised when I informed them about the \$2 billion Department of Energy loan that NW Innovation Works is applying for and for the taxpayers are the ones who would underwrite the entire project. They never heard anything about it, and when they did, they asked why?

Then it was the \$143 million in local and state tax breaks that they fought for in Olympia. Nothing about how the higher taxes and jobs promised will only be realized if they build a second phase.

I never heard anything about the people at NWIW? Did they ever build or worked at a methanol refinery, and what was their experience?

Why are there so many current and former elected officials working for them even though they have never made dollar one? There needs to be a story on the amount of money being spent on pushing this project.

Then there is the methanol for fuel debate; the story was just brushed aside after the spokesman for NWIW stated to the reporter that it was just "confusion" on its use, even though the company had a PowerPoint presentation in 2018 shown to Satori Partners Inc., a U.S.-based investment group, discussing using methanol as a fuel for industries and transportation and Wu Lebin, chairman of CASH, the main backer of the Kalama project, has said that the fuel will be burned as feedstock for fuel and industries.

And in the article:

Controversial Kalama Methanol Plant May Be Misleading Public, Regulators

By Molly Solomon (OPB)

Vancouver, Wash. April 19, 2019 9:30 p.m.

NW Innovation Works also sponsored a two-day workshop at Stanford University in 2017 on methanol production titled "Opportunities and Challenges for Methanol as a Global Liquid Energy Carrier." Conference reading materials fail even to mention using methanol to create olefins or plastics, again downplaying a point that is a central talking point when the company talks about its plans for the Kalama facility.

Below is a list of names and the companies at the "informational workshop" sponsored by NWIW. Notice how many energy carriers and gas companies are listed.

The Department of Ecology needs to call these people or write and ask them if they were informed that the conference was just for information or was it for investments in methanol production as fuel, as the workshop title so clearly stated.

If it weren't for the environmental groups like the River Keepers, we would have welcomed them in and only learned many years later that we were entirely in the dark.

I will repeat this because it is crucial in this study. How can every environmental group be so wrong when it comes to this refinery? Is the methanol's sales pitch that convincing?

Jennifer Vinnard

Thank you for extending the comment period, it's very much appreciated. As Dept of Ecology, I realize that it's your job to look at the science and data, the proven deceptions and issues about things like jobs, property values dropping, taxpayers dollars funding a foreign government owned company, etc..doesn't weigh on your decision, but what should, is that this project was brought to Washington officials under the pretence that 100% of the methanol created was going to be used for olefin's, absolutely no fuel, yet their PowerPoint presentation to investors makes it extremely clear that fuel use is their objective, not to mention ads about China producing 10,000 (to start) methanol fueled cars, their new "investor", who just happens to build methanol fueled shipping tankers, fuel is the goal. With the new DSSEIS, you calculated ghg emissions for up to 40% being burned as fuel, why would you not calculate 100%, or even 75%, given that they roped investors with 25 of 26 pages all about fuel uses? In order to be a truly transparent and fair assessment, we deserve to know the ghg emissions for every possible scenario, not just lowballed figure's.

It is also very troubling the amount of assumptions and speculations this projects approval appears to be being based upon! With absolutely zero proof to back up claims that this refinery would displace coal use in China, in fact, proof of the opposite exists, like China's economic 5yr plan to build coal power plants in each province by 2023...the "carbon neutral" by 2060 pledge, which doesn't mean a reduction of ghg emissions, rather they'll try to emit the same amount of "good" to "bad"..so they can keep pumping out high ghg emissions and give the appearance of helping the environment, the \$6.7 billion approved just last year for new coal mining sites, coal consumption continuously increasing as does their coal import demands..the reality is that China cannot afford hundreds of billions to retrofit all the existing coal burning homes, industries and businesses, you're assuming they'll reduce consumption when all they've done is increase it..speculating just doesn't make sense. Especially since even in Washington, the coal power plant in Eastern WA that was slated to close, is looking like it's going to be purchased by a Montana company, who intends to use loopholes to run the plant indefinitely..ghg reduction would be fantastic, but too many people don't care about the effects and will do whatever they can to make money, regardless of whose expense it comes at.

Living in Washington our whole lives, there's no place else my husband and I would rather live. We love the outdoors, our lush green forests and fish filled rivers, which is why we moved to Kalama, the area we grew up enjoying and couldn't wait to move to, living just a few miles from the proposed site, we will have a steady stream of dangerous chemicals pushed up the canyon to our home, that we would be breathing into our lungs, and that would destroy our dream we've worked so hard for. Of those who support it or stand to profit, most don't live here, or don't live close enough to be as affected. They don't want it built in their towns, but throwing us under the bus is just fine, why should they care, it doesn't hurt their health or property's, they're motivated by greed, not what's best for our town, our economy, our environment, our state, our country, or our planet. Please don't let assumptions and speculations determine our future for the next 40 years...this is not what Washington state needs..we need businesses that won't destroy us. We are praying that you deny the permit, for all our sake, the consequences are not worth any amount of money! Thank you for your time, the Vinnard family, Kalama.

Kristin Edmark

Please omit from the SSEIS and leave out all reference to displacement of other fuels by methanol produced at the methanol refinery. There is no evidence that any facility would be displaced.

Please omit from the SSEIS and leave out all reference to 40% of the methanol use as fuel. While interesting at this point in time, fuel use is dynamic.

These economic models are too speculative and so uncertain that the margin of error is too great to be considered. The time period is too long when experience shows not only the rapid change in economic conditions in the world. World leaders recognize that we need to accelerate change in fuel consumption.

These economic models are too uncertain because:

1) We cannot predict China's energy needs or uses. Conflicting messages have been made public. At the United Nations, 9/20/20, President Xi Jinping pledged that China's carbon emission will decline beginning in 2030 and that China will be carbon neutral before 2060. Source:

[https://gcaplain.com/china-pledges-to-be-carbon-neutral-by-2060/?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed: Gcaplain \(gCaptain.com\)&goal=0_f50174ef03-c7996e9511-169978253&mc_cid=c7996e9511&mc_eid=033cdd1d41](https://gcaplain.com/china-pledges-to-be-carbon-neutral-by-2060/?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed: Gcaplain (gCaptain.com)&goal=0_f50174ef03-c7996e9511-169978253&mc_cid=c7996e9511&mc_eid=033cdd1d41) and <https://www.nytimes.com/2020/09/23/world/asia/china-climate-change.html>) This would signal rapid decrease in the need for fossil fuels. China signed the Paris Climate agreement and is a world leader in carbon free energy technology, wind, solar, electric buses and cars. The Chinese have the strictest emissions standards for automobiles in the world. Yet on the other hand, there is much evidence that China is increasing control of world fossil fuel sources as evidenced by the Belt and Road initiative, new pipelines, the purchase of energy rights around the world like Canada and Australia while, at the same time, preserving its own fossil fuel reserves. Furthermore, it would be imprudent and naive to trust official statements by the Chinese government.

2) Countries and jurisdictions are moving off fossil fuels. There is too much uncertainty to predict over 40 years China's demand for fossil fuels. Would methanol displace wind energy if cheaper? Currently, China imports fossil fuels because it is cheaper than exploiting their own reserves and helps them dominate world energy supply.

Many countries have goals to decrease or eliminate fossil fuels use. It is likely the US will have such goals soon. Many states like Washington have fossil fuel reduction and elimination goals. As do many cities in Washington like Bellingham. Twenty cities in California, and ten cities on the east coast are developing policies to require new construction to be all electric. Energy use and technology is quickly changing; the economic models included in the SSEIS become misleading and useless as energy use quickly changes.

3) Countries and jurisdictions are moving away from plastics. Many countries, states and cities (including Washington, by 2022) have banned various forms of plastic.

4) The present situation does not predict the future. It cannot be said with any certainty that if we don't build this methanol plant, then China will build something that produces more CO₂, for the same product. Demand and supply are far too uncertain.

5) The relations between China and US are not certain. Recently, we have seen conflicts regarding patents. Recently, the US has pulled out of important international agreements causing countries to distrust the US and leaving a void for Chinese leadership. As China supplants the US in some areas, there could be more conflict over 40 years. Chinese own rights to some Canadian drilling fields. NWIW is controlled indirectly by the Chinese government. Adding the methanol refinery to Chinese control seems unwise. The US should be monitoring contracts and agreements. We may not want Chinese controlled vessels coming up the Columbia.

6) Climate change is predicted to cause stress and possible collapse of governments and societies around the planet as well as significant numbers of climate refugees. With the refinery, climate change will progress more rapidly increasing government instability and creating a situation where conflict between the US and China is more likely. Increasing climate change makes the economic models used in the SSEIS less likely.

The economic models included in the SSEIS should be removed because the SSEIS is largely a scientific study. Baseless assumptions are needed for both of the economic model of methanol replacing dirtier production methods and the model that a certain percentage of the methanol will be used as fuel. These assumptions are far too speculative in our quickly changing world over such a long period of time. Please leave out of the SSEIS every reference to methanol displacing other fuels and every reference dealing with a certain amount of methanol being used as fuel in China.

Thank you.

PS. The methanol refinery affects me personally. My daughter in law's family lost a beloved home last month to Oregon fire.

Pandemics increase with global warming, etc

L Burchard

The proposed Kalama methanol plant would be a disaster for the health and well-being of Washingtonians. As we grapple with the impacts of climate change, with the entire state under hazardous amounts of smog for much of September, it is reckless to consider building one of the largest methanol plants in the world here in our state. Methane, which will be leaked from the facility and in transport, is many more times potent than carbon dioxide as a greenhouse gas. The facility would use more water per day than the entire city of Portland. As a physician, it is inconceivable that we would undergo this endeavor during a time in which population health has been under such assault, from unprecedented pandemics to massive wildfires caused by greenhouse gas emissions.

This project will harm human health.

Debby Felnagle

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. I am deeply troubled about the short sightedness of those companies who are willing to put profit over the health of the planet and our progeny. As humans, we are blessed with the ability to adapt (that's why we're still here but the dinosaurs aren't). For the love of Creation and each other, let's put our intelligence and innovation into solutions that help this planet recover from the damage already done and move towards a sustainable future.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Debby Felnagle

Mary Belshaw

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

I am invested in a low carbon future that includes less cheap plastics and a move away from fossil fuels. The Kalama methanol refinery will increase both. Building this, the world's largest methanol refinery, will make it easier to increase the world's cheap plastics and will not move us away from fossil fuels.

Accidents happen, they always do. Climate warming methane leakages will happen, as happened in the 2018 blowout at a gas well in Ohio. We value our clean air and our clean water and lament that both are becoming more scarce. We value a healthy environment for our children and grandchildren. We need to look beyond today and build a cleaner world, not continue the track we are on.

Please HEED THE SCIENCE and reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. Thank you.

Sincerely,
Mary S. Belshaw

L Detering

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We do not need more fracked gas! Washington does not want the pollution. We need clean energy! We do not need to pollute our state to ship energy to other countries. Companies making a profit off of fracked gas are not paying the real cost to the earth the air & the water. We DO NOT NEED IT or Want It!

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
L. Detering

Marilyn Mayers

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We need to transition to clean energy as quickly as possible. Building out more fossil fuel infrastructure would lock us into higher carbon emissions and pollution which we desperately need to avoid if we are to secure a decent future for our children. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

NW Innovation Works is pushing for this despite widespread community opposition and the adverse environmental impact constructing this facility would cause. I urge you to reject any methanol refinery in Kalama or elsewhere in our state. Do not grant a Shorelines Permit for them to pursue this grossly immoral project. Thank you!

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. Daniel Peterson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. I speak on behalf of many who think this proposal is bad--bad for our environment, bad for our future, bad for people, and ultimately--insofar as it perpetuates the assumption that fossil fuels are a sound, long-term investment--bad for our economy.

Please do not do this!

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. Kristin Follmer

The proposed Kalama methanol plant is bad news. We must think bigger than just the Kalama community.

As we grapple with the impacts of climate change, with the entire state under hazardous amounts of smog for much of September, it is reckless to consider building one of the largest methanol plants in the world here in our state. Methane, which will be leaked from the facility and in transport, is many more times potent than carbon dioxide as a greenhouse gas. The facility would use more water per day than the entire city of Portland. It is inconceivable that we would undergo this endeavor during a time in which population health has been under such assault, from unprecedented pandemics to massive wildfires caused by greenhouse gas emissions.

Leslie Spurling

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We are called to be stewards of the earth and all within it, not compulsive consumers, stripping it bare. We have and are developing renewable, non-polluting sources of energy and we need to stop using these dirty sources. As we move away from them, new jobs in the new technology will develop. Just as in the horse and buggy days as the world converted to coal and oil, some jobs will disappear, some will change, some will be born. We need to move forward with this new conversion, as quickly as possible.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Susan Haywood

The last thing we need in the Pacific Northwest is a project that will worsen the climate chaos, endanger the Columbia River, and harm a community. This project does all of these things.

This project will create air pollution in the extreme. The beauty and value of our region will suffer. LNG and methanol are extremely volatile and are harming our world all along the production line.

Transporting these fossil fuel products is dangerous. Oil trains have exploded, once in the Columbia River Gorge, and the pipelines that carry LNG have leaked into our water supplies. Water is basic to life. Making plastic is not.

Industries and citizens in Washington will suffer if this refinery is built in Kalama. Other entities have made investments in the area, and their needs and wishes should come first. Short-term thinking is not a solution for long-term well-being.

Bonnie McKinlay

In 1899, Commissioner Charles H. Duell of the U.S. Patent Office stated that "everything that can be invented has been invented". It appears that after more than 12 decades laden with miraculous inventions, the Commissioner was incorrect. Also incorrect is the assumption that "everything good for Kalama is and will continue to be methanol".

We now experience, and await further, green energy alternatives to fossil fuels.

Dept of Ecology is well aware of current and continued climate realities. NWIW's promotion of methanol and the future viability of the Kalama Manufacturing & Marine Export Facility is inconsistent with the planet's climate condition and the positive direction of clean energy sources. I urge the Washington State Dept of Ecology to go beyond the faulty standard set by Commissioner Duell by denying NWIW's methanol misdirection.

Diana Gordon

The amount of greenhouse gases that would be released every year from the proposed Kalama methanol refinery make it unacceptable in a year that has seen considerable climate chaos.

Here in the West, we have been plagued by our continuing drought. Droughts have always been a natural part of our landscape, but climate change has transformed a 'normal' drought into a megadrought. The 19 years from 2000-2018 was the driest period since the late 1500's as ascertained by hydrological modeling and new 1200-year tree-ring reconstructions of summer soil moisture reported in the journal Science (April, 2020). With the moisture sucked out of the soil by extreme dryness and vegetation stressed, forests and other areas are sitting ducks for fires, especially during high wind events.

We know most of the factors that cause climate change and we must act urgently to curb anthropogenic greenhouse gas emission. Methane is an efficient driver of climate change because it is quite good at trapping heat in the earth's atmosphere. In fact, it is about 84 times more effective at this than CO₂.

We are faced with the sobering statistic that global methane concentrations rose from 722 parts per billion before the industrial era to 1866 ppb by 2019, the highest in 800,000 years. We also know that the Kalama methanol refinery will add at least 4.6 million tons of methane a year to that.

Unlike Vegas, what happens in Kalama will not stay in Kalama. Our methane will add yet more to the global total with the staggering results that we are already witnessing. The climate has warmed about 1 degree C and the effects are devastating now, in real time.

This project is rife with uncertainty. Will they actually use this methanol as olefins for plastic or repurpose it for fuel which produces even more GHG's? Will the Port use the refinery as an anchor project and require yet another pipeline to supply all its gas needs? Will they require so much of Washington's gas that other industries will be hampered? How many jobs will actually materialize from this destructive project - we know that most refineries require specialized job skills that few in Kalama will possess?

Will this project prevent the Port from developing a more sustainable economic plan with a variety of smaller businesses that will provide a more stable and less risky base?

I cannot see anything in this refinery that will truly benefit Washington. Please deny the Shoreline Permit and let us move on to a viable and more sustainable future.

Mark Keely

Port of Kalama's determination to marry the shell company NWIW to Washington State is a disastrous greenwashing disguise. This refinery proposal will never pan out for the people of Cowlitz County and POK knows it. They are just using this latest project to try to get the 3.1 mile lateral pipeline in so that they lock us into 40 more years of fracked gas infrastructure and consumption. If they cared about jobs, they would have moved to a viable project on that 90-acres years ago. If they cared about climate, they would have moved to a viable green proposal years ago. DON'T BE FOOLED, Dept. of Ecology. You are being sold a line of BS. NWIW and the POK are throwing you red herrings that deprive the people of actual opportunities and bring to a standstill any potential sustainable businesses. DENY Kalama methanol. We must do better NOW.

Howard Shapiro

The methanol refinery must be stopped. NO Kalama Methanol Refinery, it is poison to the Columbia and the Pacific NW.

Howard Shapiro

NO Kalama Methanol Refinery because our important natural resource will be further polluted.
Fracking gas is a danger to our climate, a pipeline across Washington will with ruin air and water resources and will exacerbate our climate catastrophe.

NO
methanol
refinery

CleanAirKalama.com

Alice Shapiro

No methanol refinery, please! We are rapidly depleting the purity of our air and water. Also, there are so many climate catastrophes currently happening--fires, unseasonably hot weather, hurricanes, tropical storms, poor air quality, and many more, that will only increase due to methanol released into our atmosphere. The time to stop is long past due!!!

Alice Shapiro

Our future is at stake. I am an old woman. My own health is at risk, as is my husband's. And, more importantly, the health and well being of my precious family, young, middle-aged, and old, is at stake--as is the future for all species here and to come. NO refinery--no more damage to our already compromised, endangered planet.

Coquette Shapiro

All species are important and must be protected. NO methanol refinery. We must not upset the delicate balance of climate, water, air and the entire web of life!

Linda Leonard

The greatest crisis we face as a civilization is climate change which is driven by the burning of fossil fuels. We are at a tipping point; the warming of the planet is causing the accelerated melting of the Greenland and Antarctic ice sheets.

The effects we are seeing are catastrophic, setting records.

1. The highest temperature ever recorded on earth in Death Valley during August 2020 was 130 degrees.
2. The worst wildfire season in history on the West Coast.
3. The East Coast is experiencing twice the number of tropical storms than normal.

The SSEIS analysis shows that current global greenhouse emissions for the state of Washington would increase substantially if this project were built. The increased pollution from the world's largest fracked gas to methanol refinery in the world, here in Kalama, would add 4.6 million tons of carbon dioxide to the atmosphere each year. This project's demand for fracked gas would exceed the consumption of the Northwest biggest cities combined.

Factor in the fracked gas transportation leakage rates, the usage of methanol being used to make plastics or used for fuel, Northwest Innovation Works' proposed refinery would jump to 9.4 million metric tons of greenhouse gases per year. This project would increase fracked gas demand, resulting in more well drilling, fracking and would require a larger capacity of gas, resulting in a new pipeline being needed, locking in future fossil fuel usage for the next 40 years.

Is this what we want for Washington state or do we need to move toward a low carbon future?

Governor Inslee's Evergreen Action Plan is the clean energy needed. This plan is built upon 5 key principles.

1. Power the economy with 100% clean energy.
2. Invest in good jobs, infrastructure, Industry and Innovation.
3. Build greater Justice and Economic Inclusion.
4. End Fossil fuel Giveaways
5. Mobilizing Global Action

We have a global responsibility to phase out fossil fuel reliance in favor of clean energy.

As a resident of Kalama, I am concerned for the future of Kalama, the consequences of this massive fracked gas to methanol refinery will have on the health and safety of the citizens. We all deserve the right to clean air and water and to protect the Columbia River.

The evidence in the SSEIS demonstrates that the Department of Ecology must deny NWIW the permit needed for this project to proceed. We cannot keep building fossil fuel export infrastructures, the dangers of climate change are real.

Donna Orr

I am a resident of Cowlitz County, not another state or country. I am an ordinary citizen that has watched with amazement at the persistent delays that are crushing each suggestion of economic recovery to our county. There is no "perfect" manufacturing or industrial process. There will always be people opposed to any and all such business, even though it may be a legitimate business that provides a product or result that has a legitimate use. It appears that NWIW has done what has been asked by the state to be able to proceed with their business. Please stop moving the goalposts and let them build. We need jobs, not more "grants" or other public assistance programs. I sincerely hope the decision has not already been made & your request for comments is not just window dressing for the peons.

Bonnie McKinlay

To accept the proposal to advance the construction of the Kalama Manufacturing & Marine Export Facility at the dawn of human-caused climate disruption is unacceptable. I urge Dept of Ecology to reject this plan. We all are entrusted to care for this special planet. To permit NWIW's mega-facility to be dropped on the Columbia Riverbank at Kalama would be irresponsible to the human, plant and animal life in SW Washington. Such an acceptance of the methanol refinery smashes our hopes of addressing climate disruption before time runs out.

Susan Haywood

Just say NO to the refinery in Kalama.

It is a climate catastrophe even before it gets to Washington state. Tar sands are spewing methane as we speak. Pipelines are leaking into water supplies. Oil trains explode---in fact one did here in Mosier, Oregon not long ago. Last year a train hit a concrete pillar just across the river.

Anonymous Anonymous

The proposed Kalama methanol plant would be a disaster for the health and well-being of Washingtonians. As we grapple with the impacts of climate change, with the entire state under hazardous amounts of smog for much of September, it is reckless to consider building one of the largest methanol plants in the world here in our state. Methane, which will be leaked from the facility and in transport, is many more times potent than carbon dioxide as a greenhouse gas. The facility would use more water per day than the entire city of Portland. As a physician, it is inconceivable that we would undergo this endeavor during a time in which population health has been under such assault, from unprecedented pandemics to massive wildfires caused by greenhouse gas emissions.

Timothy Lewis

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Steve LACROIX

I am strongly opposed to the permitting of Kalama Manufacturing and Marine Export Facility. The proposed merit that it will displace coal plants in China is ludicrous. Just because one actor is slightly worse than ourselves does not have us coming out on top. We all lose if we don't curb our emissions and global warming. Please deny permitting of this facility.

MLou christ

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Bill Adams

Please do not let this project happen. It would be an environmental train wreck in the making. According to Sightline Institute, a PNW environmental think-tank, its air pollution would be equivalent to 4.6 million tons of carbon dioxide each year or about 5% of our state's total climate emissions from all other activities combined. We don't need 5% more emissions. We need 5% less if we are to have any climate benefits. This project is not going to make that happen. It would only worsen our climate situation. Please do the right thing and reject it. Thank you, Bill Adams

Liisa Wale

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

jim minick

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

This methanol refinery is a way for Canada to be able to export natural gas to world markets and will cause catastrophic higher energy costs to the NW consumers and businesses by possibly paying 2/3 more for natural gas.

This article below shows Northwest Innovation Works is using this methanol for fuel and how this project is just a way to monetize and release large amounts of stranded Canadian natural gas. I have also enclosed a document showing that exporting natural gas benefits only a small and narrow portion of the U.S. economy, and not in the interest of the public (consumers and economy at large).

Liquid-rich gas production: An imperative opportunity for Canada
13 Feb 2018 Mary Hemmingsen, EVP and CFO, Northwest Innovation Works

When it comes to gas monetisation, Canada is looking for new approaches to remain competitive against the mature exporting markets. NorthWest Innovation Works is a multi-national partnership, committed to meeting the global need of a cleaner source for methanol production. This new technology will not only reduce the global carbon footprint but also introduce new gas monetisation techniques to Canada.

Ahead of the Canada Gas and LNG Conference and Exhibition, 14-16 May, Gastech Insights spoke with Executive Advisory Board Member and Executive Vice President & CFO at NorthWest Innovation Works, Mary Hemmingsen, to discover more about the organisation and what these new opportunities mean for Canada's gas industry.

Gastech Insights: NW Innovation Works is committed to meeting a global need for clean-burning liquid fuels and clean feedstock for petrochemical industry. Can you tell us more about methanol as a clean and versatile energy carrier?

Mary Hemmingsen: Methanol's versatility leads to many important applications as a clean and multipurpose fuel and feedstock: in marine and ground transport, power, heat and petrochemical applications. Adding to this versatility, methanol exists as a clear liquid form in ambient conditions, that is water soluble and biodegradable, ensuring easier and safer shipping and distribution.

Methanol demand is expected to increase steadily through 2035, in part, driven by increasing MTO demand with low-cost gas-based manufactured methanol that is more competitive to coal-based methanol. This rapid rise in MTO is led by China, driven by opportunities in the value chain and for improved environmental performance. Among the fuel applications being expanded is the:

- Marine Sector: Currently consumes 370 million metric tonnes of bunker fuel per annum. IMO standards on SOX & NOX emissions are required to be met by 2020 with methanol poised to capture at least 20% of this market based on methanol's attributes of cost-effective lower emission output.

- **Ground Transportation Fuel:** China, with others following, is leading the growing utilization of methanol as a clean fuel for transportation. Methanol standards have already been implemented in 14 Chinese Provinces mandating methanol blending, and are being implemented in additional Provinces.
- **Small Mid-Boiler Market:** In China, over 600,000 small to medium size industrial boilers consume approximately 700 million metric tons of coal per year or 18% of China's coal consumption. The opportunity to vastly improve environmental performance has motivated the Chinese government to phase out all coal-fired boilers with the capacity of 35 tonnes/hour or less by 2020, creating a corresponding conversion opportunity to methanol-fired boilers on the heels of currently converted boiler units which consume about 1 MTPA of methanol.

Gastech Insights: What monetisation opportunities can the methanol markets sector offer Canadian gas producers and what work needs to be done to ensure these opportunities are realised?

Mary Hemmingsen: Canada needs to realize the first-mover opportunity and accelerate aggressive efforts to capture new high value-add methanol markets in scale development. Leveraging our low-cost natural gas and advantaged gateway to a new growing clean Asian methanol economy, we need to crack the barrier of pipeline access and relentlessly focus our efforts to deliver a cost competitive advantage. Scale development and scale economics using between 1 to 2 bcf of gas would support at least two facilities of up to 28 MTPA of manufactured methanol and would capture a portion of the identified and looming methanol demand.

We need to act on the investment in related development already made in modularized construction and of interested host First Nations. This includes formalizing investments and the sharing of investment, costs and/or corridors for pipelines as well as providing various fiscal support arrangements and removing pipeline and other costs and delay barriers such as import duties and prolonged regulatory process, based on the high value-add for Western Canada and Canada as a whole.

We need to invest as a coordinated industry value chain and supply chain, relentlessly focused on cost competitiveness to be first to this new market. In doing so we can capture both a rapid step function increase in Asian methanol demand toward improved environmental performance and provide a supporting platform for other gas exports including Natural Gas Liquids (NGL) and LNG.

Gastech Insights: How can the industry harness the potential of liquid-rich gas successfully – allowing NGLs to turn from a hindrance to a help for Canadian shale producers?

Mary Hemmingsen: Recognizing the increasing "hotness" of liquid-rich production such as Montney gas, investment in pipeline corridors and support for co-development platforms, complemented by coordination in market development, is not only an opportunity but an imperative. Our Canadian governments and agencies, in partnership with focused industry players, can establish market entry and market penetration in supporting a cost competitive and timely development and manufacturing environment.

Gastech Insights: Why should industry players attend the Canada Gas and LNG Exhibition and Conference in May?

Mary Hemmingsen: The conference will bring together the players who are poised to inform and lead a new thrust for market access and development for our vast Western Canadian gas resources,

and in doing so realize the opportunity of gas value-add export products to contribute to the trifecta of energy, economic and global environmental performance improvement.

The Canada Gas and LNG Exhibition and Conference on 14-16 May, will identify the opportunity, tackle the challenges and set the solutions for long-term gas monetisation in Canada. Hear Ms Hemmingsen speak along with many other industry experts, book your pass today.

The NW Innovation Works and how methanol instead of LNG facilitate and export Canadian stranded gas. The higher costs associated with exporting it and the effects it will have on the NW economy is detailed in the articles below.

BP and China sign methanol plants at Port of Kalama and Port Westward
BP and China create Northwest Innovation Works JV

The UK super major BP and China Academy of Sciences created a cascade of joint venture called Clean Energy Technology Company to run the Northwest Innovation Works joint venture, a newly formed company, to build and operate twin major greenfield methanol plants at Port of Kalama in Washington, and at Port Westward in Oregon, USA.

With a total capital expenditure of \$3.6 billion, BP and China Academy of Sciences intend to use the gas-to-methanol conversion to facilitate the export of natural gas to China.

Methanol proposal arrived in Tacoma after extensive Inslee courtship
By Derrick Nunnally APRIL 09, 2016

A chart in the presentation's slide show described the Northwest's natural gas as a "stranded cheap resource." Another slide said it could become more profitable if converted to methanol for export than if exported as liquid natural gas.

Testimony of Paul N. Cicio
President
Industrial Energy Consumers of America

Excessive LNG exports significantly accelerate consumption of U.S. low-cost natural gas - damaging long-term manufacturing competitiveness and jobs.

Excessive LNG exports are not in the public interest and will increase the domestic price of natural gas and natural gas-fired electricity, reduce global competitiveness, reduce GDP, and impact middle class jobs.

Exporting LNG is a failed public policy. Consuming the natural gas in manufacturing creates eight times more middle class jobs.

Excessive LNG exports significantly accelerate consumption of low-cost natural gas – damaging long-term manufacturing competitiveness and jobs.

Natural gas is not a renewable resource and LNG exports significantly accelerate the consumption of U.S. low-cost natural gas.

Pacific NW Consumers Will Pay More for Energy if LNG Exports Go Forward
Where does Spectra's Westcoast Energy pipeline go at the U.S. border?

July 25, 2014 British Columbia, Canada, FERC, Washington John S. Quarterman

The combined Oregon LNG/Williams Expansion projects will force Pacific Northwest gas customers to outbid high-priced Asian markets for North American natural gas. The project will increase prices for every NW resident. Paul Cicio, President of the Industrial Energy Consumers of America, stated, "In the end, it's going to be every homeowner, every farmer buying fertilizer, and every manufacturer trying to create jobs who is going to be hurt by this."

Monetizing methanol Exporting natural gas in the form of methanol offers several advantages over the LNG pathway, argues an energy security expert.

Why Canada needs more pipelines FEBRUARY 13, 2019

In recent months, Canadian natural gas has been trading as low as one-third the price of U.S. gas, and sometimes close to one-tenth the price it could fetch in new markets, such as China, Japan, Korea and India.

For producers to realize better prices for natural gas they must diversify away from dependence on the U.S. market to areas where there's greater demand.

Rescue stranded gas assets with new markets, urges expert

B.C. has world-class natural gas reserves, but so does the U.S., which has gone from customer to competitor

By Nelson Bennett | March 29, 2016

Cheap gas from the Marcellus shale formation in New York state has been flooding into Eastern Canada, which was once supplied largely by the western provinces.

"That used to be almost all Canadian gas," said Dan Allan, executive vice-president of the Canadian Society for Unconventional Resources. "It's now being displaced by cheaper [U.S.] gas."

From 2007 to 2014, exports of Canadian natural gas to the U.S. declined 29%, according to Geoff Morrison, B.C. manager of operations for the Canadian Association of Petroleum Producers.

The Canadian Energy Research Institute estimates the flow of gas from the U.S. into Canada will double by 2027.

Thanks to the shale gas revolution, the Marcellus shale formation alone now produces more natural gas than all of Canada, Morrison said.

"We've been observing the U.S. [supplying gas to] markets that we traditionally serve, both in the States but also places like southern Ontario and Quebec," Morrison said. "Our biggest customer is now our biggest competitor, both in terms of North America [and] in terms of LNG."

But the U.S. isn't the only country with rich unconventional gas assets. The Montney Formation in northeastern B.C. is considered one of the richest in North America, due to its liquids.

And earlier this month, the National Energy Board updated estimates for the Liard Basin, which straddles B.C., the Yukon and the Northwest Territories. According to that estimate, B.C.'s share of the Liard has four times as much gas as previously estimated.

But without an export market in the form of an LNG industry, it's unlikely to see much

development.

"We've got a big tank of gas up here and we've got limited customers," said Greg Bury, president of the Gas Processing Association Canada. "If we don't get to the coast, ultimately we are going to have stranded gas and we are going to stop building projects.

"It's happening every day as we speak. I have been intimately involved with so many project cancellations that it's ridiculous."

Porter suggested the North American public doesn't realize just how important the shale gas boom has been for the American economy.

"We estimate that more than half of all the jobs that have been created since the Great Recession ended were in energy, or related to energy in one way or another," he said.

Since energy is a huge part of any economy, cheap oil and gas – for both power and transportation – are a huge competitive advantage.

"This has allowed us in the U.S. to have a substantial energy cost advantage over pretty much every other country, except Canada," Porter said.

But both Canada and the U.S. are at a crossroads.

Because of the local environmental concerns that fracking poses, and concerns about the effect on climate change of burning natural gas, shale gas and LNG are getting a rough ride in the department of social licence and the office of public opinion.

But just as North American innovation led to the shale energy revolution, Porter said, it can also address the attendant environmental concerns.

"This opportunity is truly a game-changer," Porter said. "Right now it doesn't feel so good, because oil prices are down and gas prices are linked to oil. But over the long run, this downturn is stimulating another wave of innovation and efficiency and competitive advantage."

Far from thwarting renewable energy investments, natural gas could be a buttress, he said.

"We're going to need a lot of natural gas if we're going to make the transition to clean energy.

Natural gas is a powerful tool we have to make this transition, because it's going to take decades to do it. In the process of using natural gas as a transitional fuel, it's going to also hold down the cost of the transition."

2018 Economic Report Series LEVERAGING OPPORTUNITIES: DIVERSIFYING CANADA'S OIL AND NATURAL GAS MARKETS

Canadian producers are currently faced with insufficient takeaway capacity for both oil and natural gas. This in turn limits Canada's ability to serve existing domestic and U.S. markets, and prevents Canada from accessing emerging overseas markets.

Even more urgently, lack of infrastructure has caused discounted prices for Canadian oil and natural gas exports to the U.S. These price discounts cost Canadians billions of dollars every year. Canadians deserve fair market value for our natural resources.

The key to obtaining better value for our resources in global markets is to build new and improve existing infrastructure, so Canadian energy products can compete for emerging global markets. Even more urgently, lack of infrastructure has caused discounted prices for Canadian oil and natural gas exports to the U.S.

Canadian natural gas growth is limited by pipeline infrastructure bottlenecks and a lack of LNG export infrastructure, resulting in severely discounted prices for western Canadian natural gas in both domestic and U.S. market

Prices for natural gas have been persistently low for a decade, because supply has outstripped demand

This is a highly competitive market. In 2016, Wood Mackenzie conducted a competitiveness study for LNG,⁹ which showed that a Canadian facility could deliver LNG to northern Asia markets at around US\$11 per million British thermal units (MMBtu). While not as competitive as U.S. Gulf Coast projects, Canadian projects were seen to be more competitive than Australian greenfield projects and Alaskan LNG. LEVERAGING OPPORTUN

Canadian pipeline projects currently in development – particularly TMEP – would provide producers with much-needed market access options and reduce reliance on the U.S. as Canada's single export market. In addition, the proposed Eagle Spirit Energy project would transport oil from Alberta and B.C. to a West Coast export facility.

Canada's Natural Gas Industry Really Needs LNG

For western Canada, too much supply, not enough demand, and worsening pipeline constraints have saddled the gas industry with "the lowest prices in the world," even in negative territory.

RECEIVED

By DOE/FE at 3:25 pm, Nov 20, 2018

Driftwood LNG LLC: Supplement to) FE Docket No. 16-144-LNG
Application for Long-Term,)
Multi-Contract Authorization to)
Export Liquefied Natural Gas to)
Non-Free Trade Agreement Nations)
for a 20-Year Period)

NOTICE OF INTERVENTION, PROTEST AND COMMENT

The application seeks to increase the volume of LNG for which Driftwood LNG LLC (Driftwood LNG) requests export authorization from the equivalent of 1,415.3 billion cubic feet per year (Bcf/y) of natural gas. The U.S. Department of Energy (DOE) has not yet issued a final order on the pending application.

Executive Summary

DOE and the applicant have not demonstrated that the application to export LNG to NAFTA countries is consistent with the public interest under the Natural Gas Act (NGA) and should therefore be denied. Figure 1, taken from the DOE report, "Macroeconomic Impacts of LNG Exports from the United States," illustrates that LNG exports create winners and losers. Natural gas producers and exporters are the winners and everyone else in the economy are losers, clearly illustrating that LNG exports are not in the public interest. Figure 1 makes clear that LNG exports are in the interest of the natural gas producer and LNG exporter, a small and narrow portion of the U.S. economy, and not in the interest of the public (consumers and economy at large). DOE approval of LNG export volumes connects low U.S. natural gas prices (\$3.00 MMBtu) to high global LNG prices (Asia \$12.00 MMBtu), which increases prices for U.S. consumers long term. DOE LNG export studies have violated the Data Quality Act, legally disqualifying their use as a resource for decision making. DOE has failed to consider the economic impact of a long list of consumer and economy-wide risks that are created by LNG exports. DOE failed to consider existing and future limitations in natural gas pipeline and storage infrastructure capacity and 'maximum' deliverability capacity needed to supply the U.S. market at peak demand and export LNG. All DOE reports assume that pipeline and storage capacity will be available despite the fact that constraints already exist and the ability to build-out new capacity is threatened by multiple legal and public opposition headwinds.

A Key Point: Consideration of LNG export applications need to lag the build-out of needed pipeline and storage capacity deliverability at peak demand needed to supply the U.S. homeowner, industrial and power generator consumers. If by chance that there is excess infrastructure capacity available to supply LNG export terminals, only then should these applications be considered. Unfortunately, the DOE is doing the opposite which threatens the entire domestic market. Especially at peak summer and winter demand.

If the DOE mismanages the approval volumes of LNG exports, and manufacturers lose competitive advantages, it puts trillions of dollars of manufacturing assets at risk, which is a sector with over 12 million high paying jobs.

I. Industrial Energy Consumers of America (IECA)

IECA is a nonpartisan association of leading manufacturing companies with \$1.0 trillion in annual sales and with more than 1.7 million employees. It is an organization created to promote the interests of manufacturing companies through advocacy and collaboration for which the availability, use and cost of energy, power or feedstock play a significant role in their ability to compete in domestic and world markets. IECA membership represents a diverse set of industries including: chemicals, plastics, steel, iron ore, aluminum, paper, food processing, fertilizer, insulation, glass, industrial gases, pharmaceutical, building products, automotive, brewing, independent oil refining, and cement.

II. The Natural Gas Act (NGA) requires that shipments to NFTA countries must not be inconsistent with the public interest. A U.S. Government Accountability Office (GAO) report¹ makes clear that neither Congress nor the DOE has ever defined the “public interest.” DOE is using guidelines developed in 1984 for LNG imports to inform LNG export public interest decisions.

The GAO report entitled, “Federal Approval Process for Liquefied Natural Gas Exports,” dated September 2014 includes the following statement on page 11.

In passing the NGA, Congress did not define “public interest;” however, in 1984, the DOE developed policy guidelines establishing criteria that the agency uses to evaluate applications for natural gas imports. The guidelines stipulate that, among other things, the market, not the government, should determine the price and other contract terms of imported natural gas. In 1999, DOE began applying these guidelines to natural gas exports.

In 1984, LNG imports were needed and they reduced risks for domestic consumers and manufacturers. Imports of LNG were in the public interest. LNG exports increase risk and especially market-determined LNG export levels by increasing consumer prices and reliability risks. Therefore, criteria used for decision-making in 1984 on LNG imports are inconsistent with what Congress had intended under the NGA, and should not be used to inform decision-making on LNG exports.

There is an explicit intent of Congress, in their asserting the requirement that LNG exports to non-free trade agreement (NFTA) countries must not be inconsistent with the public interest. And importantly, one can only assume they were referring to cumulative LNG export volumes because incremental volumes are too small to measure impact to the domestic price of natural gas. This is a reasonable assumption. When Congress passed the NGA and included the above-mentioned public interest provision, there is no mention of ‘markets’ as a predicate for determining levels of exports.

The U.S. Supreme Court has stated that “in order to give content and meaning to the words ‘public interest’ as used in the Federal Power and Natural Gas Acts, it is necessary

¹ “Federal Approval Process for Liquefied Natural Gas Exports,” U.S. Government Accountability Office (GAO), September 2014.

to look to the purposes for which the Acts were adopted. In the case of the Power and Gas Acts it is clear that the principal purpose of those Acts was to encourage the orderly development of plentiful supplies of electricity and natural gas at reasonable prices.”² Furthermore, the Court also stated that the “primary aim” of the NGA is “to protect consumers against exploitation at the hands of natural gas companies.”³ LNG exports exploit U.S. consumers when low domestic prices rise due to high global LNG demand.

To this point, the DOE report, “Microeconomic Impacts of LNG Exports from the United States” illustrates how natural gas companies exploit U.S. consumers by exporting LNG. You will note from Figure 1 below that the only entities that benefit from LNG exports are producers and exporters of natural gas. Everyone else is negatively impacted. The public loses. Natural gas costs increase, wages decrease, capital investment decreases, especially in manufacturing, and there is a reduction in indirect economic income.

Figure 1

U.S. consumers are benefiting by a U.S. natural gas market whereby domestic demand versus domestic supply is resulting in low relative natural gas prices. U.S. consumers are benefiting from our vast natural gas resources.

Why ‘markets’ cannot and should not be used to justify levels of specific LNG export applications volumes like this one or cumulative volumes of LNG exports is illustrated today with U.S. crude oil and gasoline prices. Because the U.S. crude oil price is connected to the global market, U.S. gasoline prices are at the highest levels in over four years. Global demand from other countries are dictating demand and price versus the

² NAACP v. Fed. Power Comm’n, 425 U.S. 662, 669-70 (1976).

³ FPC v. Hope Gas Co., 320 U. S. 591, 610 (1944).

U.S. supply and demand. The net result is that the U.S. consumer is NOT benefiting from our vast crude oil resources. This can and will happen to natural gas if our low natural gas prices are connected to the high price of global LNG markets. It is for this reason that connecting the low U.S. price of natural gas to the high global market price is NOT in the public interest.

What happened to Australia is another real time example that using markets to determine levels of LNG exports is not in the public interest. Australia has vast natural gas resources. Historically the consumer prices have been around \$3.00 MMBtu. Now, because of LNG exports, the Australian consumer pays the Asian LNG net back price. This means that the Australian consumer pays the high Asian LNG price less transportation and liquefaction costs, which has resulted in Australian domestic consumer prices at \$8, \$9 and \$10 MMBtu.

In fact, the Australian Competition and Consumer Commission started publication of LNG netback prices in order to boost price transparency.⁴ The story highlights that the Australian consumer net back prices have increased from 7.27 GJ in 2017 to 10.69 GJ YTD 2018, a 47 percent increase. In approving LNG export terminals, the Australian government let markets determine the volume of exports. A disastrous impact to their consumers and manufacturing sector as jobs continue to decrease.

The DOE study entitled, “Macroeconomic Outcomes of Market Determined Levels of U.S. LNG Exports”⁵ illustrates that LNG exports would substantially increase U.S. natural prices. Page 54 of the reports states that “for all the reference supply scenarios in the more likely range, natural gas prices could be from \$5.00 to \$6.50 per MMBtu in 2040. These mid-range scenarios have a combined probability of 47%.” This is the highest probability the study gave any scenario. Since today’s Henry Hub price is roughly \$3.00 MMBtu, the study confirms that natural gas prices could more than double causing domestic natural gas prices to rise to a level which would harm energy-dependent manufacturers and every homeowner. Consumers do not have an alternative. This is clearly not in the public interest.

There is all pain and no gain for consumers. The DOE report confirms that market determined U.S. LNG exports will connect U.S. prices to higher global LNG prices. The DOE report says that LNG exports will reduce the price that Asian countries pay and increase U.S. prices and eventually our prices will reach parity with Asia. At that point, the U.S. will have lost its competitive advantage. The report is explicit in highlighting the economic damage to especially manufacturing companies who are large users of natural

⁴ Australian Competition and Consumer Commission started publication of LNG netback prices in order to boost transparency. October, 2018. LNG World News https://www.lngworldnews.com/australian-watchdog-starts-lng-netback-price-publication/?utm_source=email&utm_medium=email&utm_campaign=daily-update-lng-world-news-2018-10-05&uid=55872

⁵ “Macroeconomic Outcomes of Market Determined Levels of U.S. LNG Export,” U.S. Department of Energy (DOE), June 7, 2018, <https://www.energy.gov/sites/prod/files/2018/06/f52/Macroeconomic%20LNG%20Export%20Study%20018.pdf>.

gas. Importantly, manufacturers will have lost their competitive advantage, with very serious long-term implications for a viable manufacturing sector, jobs, and investment.

IECA urges the DOE to conduct a rulemaking to define the public interest for LNG exports to NFTA countries before giving consideration to this and future application to export. The DOE should not give final approval to any LNG export application without having established the definition and evaluated the cumulative impact to the public interest. LNG volumes that connect low U.S. natural gas prices to high global LNG prices long term cannot possibly be in the public interest.

III. Violation of the Data Quality Act

DOE economic evaluations of LNG export public interest considerations must not violate the Data Quality Act (DQA). Other than the first EIA report, all DOE LNG export study reports have used proprietary economic modeling whose results cannot be duplicated by others, a violation of the DQA. (see appendix).

IV. DOE has not addressed vital short and long-term risks to consumers and the economy that are core issues in considering whether an LNG export application is consistent with the public interest.

a. DOE failed to consider pipeline and storage capacity risk constraints (and at peak demand), and their cost and reliability impact.

DOE failed to consider existing and future limitations in natural gas pipeline and storage infrastructure capacity and ‘maximum’ deliverability capacity needed to supply the U.S. market at peak demand ‘and’ export LNG. All DOE reports assume that pipeline and storage capacity will be adequate despite the fact that constraints already exist and the ability to build-out new capacity is threatened by multiple legal and public opposition headwinds.

The Henry Hub basis differential is an example. There are at least five pipelines with about 9 Bcf/day of capacity moving gas from Marcellus toward the Gulf, but only 2 Bcf/day has pipeline capacity to actually get the gas to LNG export terminals in Louisiana and Texas. This means that when a Gulf coast LNG export terminal starts up, the demand will drive up (blow-out) the HH basis price for consumers in the region. A direct cause and effect.

Today, gas marketers and industrial companies have difficulty securing capacity on pipelines because gas producers have locked in firm capacity and there is no excess capacity for manufacturing companies. We cannot grow our facilities without increased pipeline capacity.

The cost impacts of natural gas pipeline and storage peak demand limits are stunning as we saw from January 1 to January 8, 2018. Winter demand prompted severe gas and electricity price spikes in PJM at an estimated cost of \$10 billion. The 2014 Polar Vortex estimated cost was \$49 billion. Any one of these types of events greatly exceeds any “net

economic benefit” from exporting LNG. During the time frame of January 1 to January 8, 2018, 58.6 percent of total ISO gas fired electricity capacity was idle because of inadequate pipeline capacity. Nearly 45,000 MW of gas-fired capacity was idle in three NE ISOs.

b. DOE’s failure to consider infrastructure pipeline deliverability and storage limitations is inconsistent with the President Trump’s concern for reliability and resiliency of the electric grid.

Approving more applications to export is getting the cart before the horse. The DOE Electricity Office is doing the right thing examining vulnerability of the pipeline infrastructure. Studies are underway that will confirm what everyone already knows is that there are existing pipeline capacity problems.

c. DOE’s failure to consider that LNG export consumers are fundamentally countries who have the ability to buy LNG from the U.S. at any price, even during winter peak demand, to keep their countries operating, results in higher marginal prices for consumers.

LNG buyers are basically countries. Either state-owned enterprises (SOEs) and or government-controlled utilities with automatic cost pass through. It is troubling that the largest LNG consuming countries have winter when we do which means that their highest demand is when we have our highest demand.

d. Failure to address cumulative demand versus natural gas resources.

A comparison of the U.S. Energy Information Administration’s (EIA) AEO 2018 cumulative demand through 2050 to EIA’s estimates of technically recoverable natural gas resources in the lower 48 shows that this demand would consume 69 percent of all resources. And, EIA has LNG exports peaking at only 14.5 Bcf/day. A very conservative forecast. While over time resources have been increasing, forecasted demand is out-stripping new resources. IECA did the same analysis using EIA AEO 2017 demand. That analysis concluded that 57 percent of all resources would be consumed. We anticipate that AEO 2019 will show substantially higher and faster consumption of available resources.

e. Failure to consider the uncertain nature of technically recoverable resources. Caution is warranted by DOE to not over-commit.

It is also important to keep in mind that *technically available* resources do not mean that they are *economical* to produce. To this point, the natural gas industry’s Potential Gas Committee’s most recent report of July 2017 states that 58 percent of all natural gas resources are classified as either ‘possible’ (new fields) or ‘speculative’ (frontier fields), which adds more uncertainty that these resources may not produce low-cost natural gas. All DOE LNG export reports assume that all of this natural gas is economical to produce when no one really knows because no one has ever drilled a well in these ‘new fields’ or ‘frontier fields’.

f. Failure to consider future political decisions to limit acreage available for drilling or regulations on water or hydraulic fracturing that increase costs that must be recovered in higher prices of natural gas.

We have Presidential elections every four years that can change everything. As we have seen with some past Administrations, there were regulatory actions to limit access to federal lands for drilling and regulations to control drilling processes that increase the cost of production. A new Administration could inflict all of these and more thereby increasing natural gas costs and prices. States have and will continue to take action to limit drilling. Caution is warranted.

g. Failure to consider that the majority of producers of natural gas do not have a positive cash flow business.

Even with relatively higher crude oil prices for the first half of 2018, only 3 of 33 oil and gas companies posted positive cash flow. This is not sustainable long-term. Wall Street is concerned about the indebtedness of producers. Investors demand certain ROE's to continue to invest or lend money for drilling more wells. The fact that interest rates are also increasing puts further pressure on costs. Combined, this means that the price of natural gas must rise. DOE LNG studies do not address this fundamental issue.

h. Foreign consumers of U.S. LNG exports are receiving the benefits of using our infrastructure that is paid for by U.S. consumers, without paying for it. Their use of it increases our costs.

LNG exports use of U.S. infrastructure increasing the costs to all U.S. consumers. DOE has failed to consider these costs.

IECA wishes to intervene and be made a party to this proceeding, with all of the rights attendant to such status pursuant to 10 C.F.R. 590.303(b).

Sincerely,

Paul N. Cicio

APPENDIX

IECA letter on Data Quality Act to the DOE

July 27, 2018

Mr. Max Everett
Chief Information Officer (CIO)
U.S. Department of Energy
1000 Independence Avenue, SW
Washington, DC, 20585

Re: Data Quality Act Request for Correction: U.S. Department of Energy (DOE) Study on Macroeconomic Outcomes of Market Determined Levels of U.S. LNG Exports, Docket No. 2018-12621

Dear Mr. Everett:

The Industrial Energy Consumers of America (IECA) requests a correction of the U.S. Department of Energy's (DOE) study on "Macroeconomic Outcomes of Market Determined Levels of U.S. LNG Exports," docket no. 2018-12621. The study uses a proprietary and non-reproducible economic model which violates the Data Quality Act (DQA). IECA seeks other important DQA corrections as well.

The DQA passed through Congress in Section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (Public Law 106-554, HR 5658)⁶ and mandates that agencies ensure "maximizing the quality, objectivity, utility, and integrity of information (included statistical information) disseminated by Federal agencies" to the public.

The DOE's "Final Report to the Office of Management and Budget on Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Department of Energy"⁷ sets specific guidelines that must be met for the quality of information to be distributed to the public. Under the DOE guidelines, the study qualifies as "influential," meaning that it may result in an annual effect on the economy of \$100 million or more.

The DQA guidelines, some of which are provided below, provide specific and important definitions. The study fails to meet these DQA standards.

- "Reproducibility: means the capability of being substantially reproduced, subject to an accepted degree of imprecision, and with respect to analytical

⁶ Treasury and General Government Appropriations Act for Fiscal Year 2001(Public Law 106-554)

<https://www.fws.gov/informationquality/section515.html>

⁷ https://www.energy.gov/sites/prod/files/nepapub/nepa_documents/RedDont/G-DOE-67FR62446OMBquality.pdf

results, “capable of being substantially reproduced” means that independent analysis of the original or supporting data using identical methods would generate similar analytical results, subject to an acceptable degree of imprecision or error.”

DOE’s own guidelines say, “At minimum, DOE Elements should assure reproducibility for those kinds of original and supporting data according to “commonly accepted scientific, financial, or statistical standards.”

- “Objectivity: means the information is presented in an accurate, clear, complete, and unbiased manner and the substance of the information is accurate, reliable, and unbiased. The guidelines require formal, independent, external peer review.”
- “Integrity: means the information has been secured and protected from unauthorized access or revision, to ensure that the information is not compromised through corruption or falsification.”

1. The DOE study uses a NERA proprietary economic model.

Third party economists have concluded that the results of the study are not reproducible, a requirement of the DQA. For this reason, a correction is necessary. A correction meaning that the study cannot be used for its intended purpose. Or, it must be redone with a non-proprietary economic model.

2. IECA seeks proof of paperwork and DOE decisions that the owner of the model, the peer review panel participants and study contributors fully complied with the DQA.

IECA believes that possibly every one of the individuals/entities involved have or will receive financial benefits from the natural gas and LNG export related industries, with the exception of John Staub of the EIA, and would not be independent in their views. A correction is necessary to comply with DOE DQA guidelines of objectivity and integrity.

IECA requests the documents that were required to be filed by study participants. The DQA guidelines state that “peer reviewers be expected to disclose to agencies prior technical/policy positions they may have taken on the issues at hand, (c) per reviewers be expected to disclose to agencies their sources of personal and institutional funding (private and public sector), and (d) peer reviews be conducted in an open and rigorous manner.”

If you have any questions, please contact me directly at 202-223-1661 or via email at pcicio@ieca-us.org.

Sincerely,

Paul N. Cicio
President

The guidelines, some of which are provided below, provide specific and important definitions. The study fails to meet DQA standards.

- “Reproducibility: means the capability of being substantially reproduced, subject to an accepted degree of imprecision, and with respect to analytical results, “capable of being substantially reproduced” means that independent analysis of the original or supporting data using identical methods would generate similar analytical results, subject to an acceptable degree of imprecision or error.”

DOE’s own guidelines say, “At minimum, DOE Elements should assure reproducibility for those kinds of original and supporting data according to “commonly accepted scientific, financial, or statistical standards.”

- “Objectivity: means the information is presented in an accurate, clear, complete, and unbiased manner and the substance of the information is accurate, reliable, and unbiased. The guidelines require formal, independent, external peer review.”
- “Integrity: means the information has been secured and protected from unauthorized access or revision, to ensure that the information is not compromised through corruption or falsification.”

JJ L

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Devon Kellogg

Department of Ecology:

As a parent, teacher, and longtime WA resident, I am deeply concerned about the effects of adding more greenhouse gasses to our atmosphere, increasing global temperatures and denying the children I raise and serve a stable climate system if we don't reverse course immediately.

Already we are experiencing the severe and costly effects of our warming world. We know from IPCC SR1.5 that we have just 10 years to reduce the offending emissions by 50% or more for our best chance at avoiding the worst effects. We cannot afford to add any more warming gasses to the mix!

For this proposed facility, fracking the gas, leaking it for transport, then producing methanol which is then shipped overseas to be used to make plastic is dirty, unhealthy and harmful at every step of the process. Permits for this project must be denied.

Thank you for your attention to this critical and urgent matter,
Devon Kellogg

Alexandra Richardson

This refinery would cause measurable and severe respiratory health problems due to air pollution to thousands of Washintonians and Oregonians, would harm iconic NW salmon and orca populations, and will fast-track our corner of the world to the climate tipping point. You know this is really bad. Please halt this project now.

Dimitri Stephanopoulos

In light of the recent IPCC report on the impending climate chaos and doom it would be completely foolhardy to go forward with this project. Please consider what this would mean for a warming planet. Nothing is more important now than reducing greenhouse gas emissions and informing the public to reduce their carbon footprint. Otherwise, it's going to keep getting hotter and more unstable until the planet will no longer be able to support organized life. It's not that far off at the rate we are emitting greenhouse gasses.

Julie Henling

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Julie Henling

Shelley Hickman

The methanol plant proposed/rammed down throat here in Kalama is astoundingly stupid. This project was planned and marketed before any input from local citizens. This plant will be below my house and that means that whatever is being discharged from the plant on most days flows up the hills, targeting the north hills side of Kalama. Should this eyesore had been planned to billow out in the South side, the outrage from those folks with big beautiful homes that include a magnificent clear and clean view would have been overwhelming. As usual, poorer neighborhoods get dirty air. Stop this madness. Save our air and water for Washington State interests. Not Chinese.

Bonnie McKinlay

Thank you for accepting public comments on this crucial issue.

It boggles my brain to think that there is a possibility that Washington state which has benefited economically from science, can consider approving the Kalama Manufacturing & Marine Export Facility. The methanol facility proposal runs counter to the prevailing scientific wisdom on ending fossil fuel expansion. Please examine the extreme environmental harms caused by the hydraulic fracturing process. I urge you to study the report, "Too Dirt, Too Dangerous" from Physicians for Social Responsibility (2017).

Bonnie McKinlay

In the words of Washington State Governor Jay Inslee, "Climate change is a matter of great peril but also one of great promise. We can pioneer the industries of the future, create millions of good-paying jobs, and build the clean energy economy of the future." Washington is fortunate to have a governor who advocates for action on climate and who has the vision to see the economic advantages of abandoning fossil fuels and moving toward renewable energy. Listen to your governor, do not accept the Kalama Manufacturing & Marine Export Facility.

Robert Brown

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. Climate change is real, and this plant would add to the problem without fixing much. I see very little promise in producing methane.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

larkbrown@comcast.net

William Falk

This project would easily be one of the worst polluters in our state. The Kalama Methanol project is an environmental disaster in the making. This project will rely on an enormous amount of fracking to provide gas to make ethanol. This would be a catastrophe for the climate.

This project makes no sense financially or environmentally. I strongly object to this project and urge our NW policymakers to oppose it.

Sara Drescher

The proposed Kalama methanol plant would have severe negative health impacts for Washingtonians. As we grapple with the impacts of climate change, with the entire state under hazardous amounts of smog for much of September, it is reckless to consider building one of the largest methanol plants in the world here in our state. Methane, which will be leaked from the facility and in transport, is many more times potent than carbon dioxide as a greenhouse gas. The facility would use more water per day than the entire city of Portland.

This project will harm human health. As a physician, I cannot condone to building of this plant in our state.

Sara Drescher, MD

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

I am having concerns about how many verbal promises the Kalama methanol officials making to the local elected leaders like this one stated at the Cowlitz County Commissioner Debate between Kurt Anagnostou and Commissioner Weber.

What can you do to open public lands in Cowlitz County if elected?

Commissioner Weber replied at 22:53 of the video, "The third area is one that is intriguing and it involves the methanol plant. As you remember, the Kalama methanol plant carries within it a promise and expectation from the company that they will mitigate 100% of the cost of the fossil fuel that they used in the production processes to the tune of about \$8 million dollars a year.

They have at least verbally that they would like a lot of that, if not all, of it, spent here in Cowlitz County to help build appropriate quality of place activities. So, you get that by supporting that application and getting that mill built.

Re Kalama Refinery

Dear Mr. Doenges

The proposed refinery at Kalama has come to my attention; and I must take the time to write to you in your position of power.

May I ask, Who exactly would profit from this terminal?

Certainly not to residents of Washington state, nor the planet. Certainly not the salmon in the Columbia River, nor the Orcas who depend on them.

I hope you already plan to SAY NO to this disaterous idea. Future generations will look at the decisions we are making now, and either thank us or throw up their hands and cry.

Please take a Firm Stand and **stop this before it happens.**

Thank you,

Dear Mr. Doenges,

All over the globe, fires rage. Glaciers and polar ice steadily melt at alarming rates. Climate change is happening now. We are in a crucial time regarding the survival of humankind and life as we know it.

It is our responsibility now to reject any new fossil fuel infrastructure. We must deny the Kalama Methanol Refinery. Instead we must look to create jobs and careers within sustainable industries.

The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not.

We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution and use more fracked gas than all of Washington's gas-fired power plants combined.

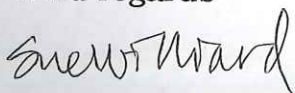

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's be bold, and redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Thank you for your attention to this important matter.

Kind regards -

Sue Williard

Proposed Kalama-turbo Plant
Kalama Manufacturing & Export Facility

I've had Natural Gas in 2 homes. ✓
Lived the side effects and use of it.
Gas causes rotten-eggs smells, like the
old Tacoma, Wa. plants that my daddy & I
use to drive by to work.

Some concerns use of water
4 time more than Ny. uses in
one year - just their guess or more!
How long would it take to drain down
the water so far that it would possible
harm other water front Seaport bussiness,
where they could not run? Who's
going to pay for water be transported
if we get low, from where, how
much to pay for water? We cannot
promise the water. Even the Kalama City
has flooded almost every year, not
promise. We've had droughts too!
Who would pay to bring water in?
Mother Earth, wind, clouds dances;
Snow clouds, Hail, water we cannot promise.

When Investor hear selling of high yield
how fast they could make monies. They
didn't think about the result. It's Greed,
lots of monies, Sounds good on paper &
meetings of investing money. How soon
they could retire. But what about people
in the area they didn't think of that.
Or even future children unborn
because of this. These people
meant well. Sometime money blinds
people's thoughts. Even people that
first were invited to the (Country Japan)
to see small fraction. Wine & dine, room,
thought wow. Jobs, money to our city.
But they didn't think of environmental
water, air toxins, and human problems,
effects. We all need money to live and jobs
to pay our bills at what expense!

Save our Mother Earth, oceans, wetlands,
Kalamia, people lives and air and forests.

We are keepers and protectors entrusted
to not damage mother earth or energy
field.

Kalama Manufacturing and Marine Export Facility Second Supplemental EIS

My husband John & I retired to Kalama, Wa. NWIW is proposing to build a fracked gas to Methanol refinery here. There is no way this project would reduce carbon emissions, in fact it would increase carbon pollution in huge amounts. This is their shell game and we would be the losers. Dept. of Ecology needs to protect the citizens from this Polluting nightmare.

Thank you

This proposed Methanol Refinery by NWIW does not meet the State of Washington's goals for reducing climate pollution. No Kalama Methanol Refinery! Thank you Teresa Flynn Kalama, WA.

610 Taylor Rd. #1813
Kalama, WA. 98625

Kalama Manufacturing and Marine Export Facility Second Supplemental EIS

My husband and I live in Kalama and are against the proposed Methanol Refinery This would be a out of control use of our resources. The pollution left behind would be enormous. The select few that would get rich ,from this never before built design is a pipe dream. Our own governor Jay Inslee has come out against this project. Please this has gone on way to long, put an end to this proposed Kalama Methanol . Refinery. Teresa Flynn Kalama, Wa.

Thank you
Teresa Flynn
610 Taylor Rd #18B
Kalama, Wa.
98625

The main purpose of this proposed project is to provide the Chinese government with a source of methanol that they can use as either a source of olefins for the plastic industry or as a fuel for transportation and industry. NWIW has stated that the intent of the methanol they will produce is intended for plastic manufacturing. The truth of the matter is that once the methanol is sold on the open market there is no way to control what it is used for.

The speculative theory that methanol produced by NWIW would result in a net reduction of global green house gas emissions due to global methanol market displacement is ludicrous. Fracking gas, transporting it through pipelines, refining the gas into methanol, transporting the methanol via tanker ship and ultimately burning the methanol all add to the global climate change crisis.

Department of Ecology needs to focus on what they can control within the State of Washington and not buy into the speculative theories that the proposed project would be "good" for the global environment. The fact of the matter is that reliance on fossil fuels is what got us to where we are now in the first place; global warming, ocean warming, sea level rise, shrinking sea ice and ocean acidification.

I encourage the Department of Ecology to adhere to the facts that this project would add a total of 3.6 million metric tonnes of green house gas emissions per year and deny the project on that basis. Than you for your consideration

Dear Mr. Doenges,

I am opposed to the Kalama Manufacturing and Marine Export Facility in any form. The first rule of "holes" states that when you are in one, stop digging. We are in a climate crisis. We need energy solutions that don't add to the problem. There is no way to mitigate the downstream effects of this facility: the health impacts to the people of Washington, (it turns out that pollution even exacerbates the effects of Covid), the fuel needed for transport, and the risk of spills to and from the facility, to name a few. All of this so the people in China can make more of the plastic that clogs our oceans.

At some point, if we are going to save this planet, we need to start saying, "NO", to more fossil fuel facilities. Please do the right thing.

Sincerely,

Carol von Borstel, Sequim, WA

RE: Kalama mtg. and Marine Export Facility
Draft Sound EIS

Dear Mr. Doenges:

I am writing regarding the above project and to express my strong hope that the permit for this project be denied. While the draft EIS goes into great length regarding methanol / greenhouse emissions, I did not see where it addressed the issue of potential contamination of the Columbia River. Is Innovation NW prepared to evacuate all of the people downstream from the plant in the event of an accident and assume full responsibility for its cleanup? This project is a disaster on many environmental levels and is not in the best interest of the State.

of Washington — not its land, not its
rivers, and not its people. I strongly
urge that this proposal be denied.

Thank you for your consideration,

Dear Decision-Makers at the Washington State Department of Ecology and other responsible Decision-Makers;

Regarding the proposed permitting of the methanol plant in Kalama, WA:

Your commission is to protect the air quality in Washington State. Will permitting this plant and its addition of "almost one million metric tons of carbon dioxide equivalent a year" execute that commission?

Your charter is to protect the air quality in Washington State. If "the Kalama facility would be one of the 10 largest sources of greenhouse gas emissions in the state", will you fulfill your charter?

Your ethical responsibility is to preserve the good air that we have in Washington State so that it does not become more like the air in China (where my son lived for three years and still suffers lung distress). Will trading carbon emission chips with China fulfill your responsibility to the citizens of Washington State?

Do you trust China to reduce their methanol production emissions in exchange for our increase in CO₂ in a world that demands more methanol? Is this a good bet for reducing world carbon numbers, or is it a deal with the devil? Isn't it your job to protect our air, in Washington and world-wide? Where is your political logic?

Do you trust the onsite Chinese managers and chemical engineers to have Washington State air quality in mind, when compared to their own, it will still seem pristine to them after the "almost 1,000,000 metric tons" per year (= 2,204,640,000 pounds) have been added to our air. Chinese companies are ultimately managed by the Chinese government and its billionaires. Do your job please. Stop this backward thinking.

Has Homeland Security weighed in on this proposed methanol site? Will it be a good policy to allow a Chinese managed plant to sit on the only narrow piece of land where the three corridors of commerce come very close together? Interstate 5, the Columbia River, and all the North-South rail-lines converge exactly on this site. Will you let the Chinese build this bomb on this regional corridor? Have you heard of Beirut in the news lately?

This failure in leadership and foresight does not need to be your legacy. The banal corruption of leadership for profit is a never-ending story. Your job is to protect the clean air of Washington State, not to add 2 trillion pounds of CO₂ per year to it. Please fulfill your charter, commission, and ethical responsibility.

Sincerely,

James K. Bruckner, Ph.D.

Greetings:

I am asking that Washington reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama.

I live on the banks of the Columbia River and I believe that we must be stewards of this river and as such we must do all we can to prevent unreasonable risks to its waters. Additionally, I see no reason to add to the world's greenhouse gases by encouraging the dangerous methods of fracking gas and transporting it great distances via pipelines.

NWIW misled your agency, and the public, about the purpose and impacts of the refinery. I am counting on Ecology to dismiss NWIW's misleading claims and accurately account for the project's upstream and downstream climate pollution. God knows there is enough plastic in the oceans. But NWIW is telling their investors they have other goals than just making plastic.

There is no reason to risk our environment on a wink and a promise that the methanol will be used appropriately once it reaches China's shore.

For the community of Kalama, and others on the Columbia River and for our climate, the risk is simply too big. A methanol plant is a design based on fuel designs of the past and not of the future. I am counting on you to do the right thing and stop this dirty, dangerous fossil fuel export project.

Sincerely;

M. Laurel Whitehurst

My question is "why are we dealing with China". We are trying to rid them from our lives. They have caused death to our pets through dog food, medicine shortages and now COVID-19 to name a few. I see other counties, cities, groups, etc. in WA wanting the methanol plant, but no one is having it built in their back yard.

Well, no one asked us. I believe the citizens of Kalama and Cowlitz County should have the opportunity of voting whether we want it in our back yard or not.

We have a pristine river which won't be staying pristine once the plant is built. Same for the air. Some of the jobs will be good for building the plant but when it's in operation, there will be only a few jobs.

I have lived here in Kalama for 45 years and will be sad to see the demise of our beautiful area.

The proposed project runs counter to climate-related statutes and aspirations in our region and poses a serious environmental danger. First, the SSEIS clearly shows that the project in itself would substantially increase greenhouse gas emissions. Further, the economic case for the project is premised on increasing consumer demand for natural gas in the Northwest over a period of decades, which could only occur by continuing to expand the current gas production and delivery infrastructure, rather than transitioning to renewable energy sources as is urgently needed. Finally, I am concerned about the proposed methanol plant's vulnerability to a major earthquake. Projections I've seen for a Magnitude 9 quake in the Cascadia Subduction Zone indicate the potential for catastrophic damage along major rivers due to shaking and soil liquefaction. The Willamette is already lined with fuel terminals on ground that is likely to be liquefied by a big quake, leading to a massive release of volatile chemicals. I assume the site of the Kalama facility would be vulnerable as well, though I did not see this addressed in the SSEIS. Thank you for your consideration.

Akaya Kreger

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Kalama Manufacturing and Marine Export Facility Second Supplemental EIS

My husband and I live in Kalama and are against the proposed Methanol Refinery This would be a out of control use of our resources. The pollution left behind would be enormous. Washington Department of Ecology
PO Box 47775
Olympia, WA 98504-7775

Mr. Doenges:

The Woodland Chamber of Commerce writes today in support of Northwest Innovation Works' proposed methanol facility in Kalama. We believe the draft report released by Ecology answers all the questions it was directed to address in a thorough and comprehensive manner. It should be finalized without further change or delay and the permits for this project should be approved.

As the report makes clear, the benefits of this project will extend well beyond the roughly 100 acre site where it will be built. Woodland residents will benefit from the number of family wage jobs the project will bring. And the new tax revenue from this project will be critically important to funding critical services from our local and state governments.

In addition, the net environmental benefit globally is now well established. These are exactly the kinds of projects we need to fight climate change. And the mitigation plan for in-state emissions sets a new standard for how Washington State can be a leader in building a sustainable economy.

With this project we don't have to choose between jobs and the environment. Our community has supported this project since it was first proposed over six years ago. Given the events of this year, the need for jobs and tax revenue is greater than ever. The questions around the plant's emissions have been thoroughly answered – the science has spoken – and it is now time to get to work.

On behalf of the Woodland Chamber of Commerce, we ask that you finalize this report without changes or delays and approve the necessary permits immediately. Our environment and our economy can't wait any longer.

Sincerely,

Janice Graham
Woodland Chamber President

Dear Rich Doenges,

I am a Washington citizen who wishes
to protect our precious NW environment. The
surrounding smoke is evidence of the urgency
to move quickly to a low carbon future. The
Kalama Methanol Refinery is not the way to
get to that future. I am counting on the Dept.
of Ecology to safeguard our health and environment
by rejecting NWI's proposed Kalama methanol refinery.

Comments re: Draft Second SEIS for the proposed Northwest Innovation Works Methanol Refinery and Export Project in Kalama WA.

To: Mr. Rich Doenges, Washington State Department of Ecology
PO Box 47775, Olympia, WA 98504-77753

I am a resident of San Juan Island in Washington State.

I am writing to you to ask you to deny the proposed Kalama Methanol Refinery project for these reasons:

Even though our islands are almost 300 miles away, the Columbia River is connected to us because of our island icons, the endangered Southern Resident Killer Whales. Orcas have been tracked following the salmon to the mouth of the river where they forage on the fish from the Snake and Columbia Rivers. These salmon, and therefore the orca, depend on the health of the rivers for survival. With this refinery, the river and its food chain would be threatened by: oil and fuel spills, ship strikes, air pollution, noise pollution, and water consumption and contamination.

As we recently experienced from the harmful air quality resulting from the wildfires in Oregon and California, air moves. What happens on the Columbia will not only affect our state, but the region and eventually the globe. This project should not even be considered due to the staggering amount of greenhouse gas emissions which would be produced as a result of before/during/after the fracking/piping/refining/shipping process associated with it. Where does this project fit in with Governor Inslee's push to reduce carbon emissions in our state? How does this project make any sense when all federal report on climate change warns that our nation is in great social and economic peril as a result of pollution of our own making? Why would we make more, on purpose?

The argument made by the backers that if we don't pollute then someone else will? How about NO POLLUTING by anyone? Our state should not be duped into becoming pollution enablers, and paying for it as well -- both in money and our health. I urge denial of this project. There is too much to lose, such as clean air and clean waters of the Columbia River, our state, region and planet.

Thank you for your consideration of these comments.

Dept. of Ecology
State of Washington

Howdy -

I, like many other people in southwest Washington, do not wish to see the Kalama Manufacturing and Marine Export facility put into operation.

Is Washington state really interested in curbing climate change or not? Lowering greenhouse gas emissions is a worthy cause and this methanol plant is not the way to do it. Whether the methanol is used for fuel or plastics - does it really matter? Either one is detrimental to our area, as well as Mother Earth.

Will the owners of this facility be held strictly liable for troubles that will undoubtedly

occur over the years? The Columbia river
has been a dumping ground for too long and one
or more ship, or trans-loading, mishaps will
only exasperate the problem.

I hope the department of ecology will
look at, and trust, the facts and not just the
temporary economic benefits - if any.

Thank you.

Sincerely,
D. Sieler

In Re: Kalama Manufacturing and Marine Export Draft Second Supplemental EIS

Dear Director Doenges,

The Grays Harbor Audubon Society is opposed to the NWIW methanol refinery proposed to be built on the Columbia River. At a time when we must reduce carbon pollution and the impacts of climate change, considered a major threat to our security, introducing the proposed refinery would cause millions of tons of greenhouse gas pollution. This level of pollution is inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C. The fact that this is a permanent installation being constructed means that methanol will continue to be exported to (probably) China for many decades to come, a strong source of greenhouse gases out of control of any U.S. regulations.

The SEIS argues that methanol could "displace" dirtier energy when in actuality it will add to the amount of dirtier energy. Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year. Combustion of the full methanol production capacity of the plant would generate 5 million tons of pollution each year.

Over 62 bird species comprising thousands of birds were identified in the area of the Columbia River near the proposed refinery by Washington Audubon members in September 2019. Birds are seriously affected by everything, from changes in the timing of their food (insects) items to massive die-offs from huge regional fires during migration. Greenhouse gases causing global warming is upsetting many of the intricate timing regimes of natural systems, including flowering, insect emergence, wildlife food sources, migration and others not yet recognized. Life as we know it depends on lowering greenhouse gases, not allowing them to persist well into the future.

In addition, the proposed facility would negatively impact public health and negatively.

1. Fracking pollutes water systems and causes physical harm from earthquakes and the devastation of surrounding habitat.
2. The pipeline required to transport fracked gas has a high-risk potential for leakage and spills, releasing harmful chemicals into ground and surface water.
3. On-site operation of the facility would pollute the Columbia River and its tributaries with harmful runoff and contribute to reduced air quality leading to increase instance of asthma and other respiratory illness.
4. Methanol emits a wide range of hazardous air pollutants including ammonia, carbon monoxide, nitrogen dioxide.
5. Methanol is highly flammable and extremely toxic if ingested or inhaled.
6. Spills into large natural bodies of water, such as rivers and oceans, cannot be contained.
7. Increase in tanker traffic would harm endangered salmon and increase risk of ship strikes that harm or kill whales near the mouth of the Columbia River.
8. Pipelines will need to be built to supply the refinery, endangering communities along the route.

9. Accumulations of methanol vapors in confined spaces may explode if ignited, and containers filled with methanol may rupture violently if exposed to fire or excessive heat for a prolonged duration.
10. The proposed plant would be built on soil with moderate to high risk of liquefaction in a known earthquake zone.

Washington cannot contribute to the goal of keeping global warming "well below 2 degrees Celsius" by allowing major polluters to move forward. A low-carbon future demands investment in lower-emitting production processes. Ecology should not assume that future energy needs must be met by fossil fuels. All fossil fuel pathways would be massive polluters. None of them will solve our climate crisis.

Ecology also fails to consider whether cleaner energy technologies may dramatically displace the need to use methanol for transportation fuels. Industry studies show that more investment in fossil fuel industries yield much less job growth than greener energies. There is a greater job return in moving to a green economy. All of these high-carbon paths are unacceptable and inconsistent with Washington's clean energy and climate goals, and will not bring the jobs promised.

Thank you for your careful consideration of these concerns. The risk is too great.

Mr. Doenges:

The Port of Longview ("Port") writes today in reference to the Second Supplemental Environmental Impact Statement ("SSEIS") the Department of Ecology ("Ecology") is currently conducting on Northwest Innovation Works' ("NWIW's") proposed Kalama methanol facility.

The Port believes that the draft SSEIS prepared by Ecology is extremely thorough and examines all the questions it was asked to answer. In addition, Ecology's highly detailed and rigorous analysis proves the argument that NWIW'S Kalama facility will result in a net reduction in global Greenhouse Gas (GHS) emissions. Using Ecology's own best estimate, this project would result in a net reduction of over six million metric tons of GHGs every year—equal to eliminating approximately two times the number of GHGs as the entire city of Seattle emits annually.

With this project, our region has the opportunity to create up to 1,000 family wages jobs during a three-year construction window and generate \$30-\$40 million in new tax revenue for our local and state governments. This represents a transformational opportunity for our county's economy. Not only will this project benefit the State and Cowlitz County, it will benefit the Port of Longview by showing the world that Washington State is open for business. Unfortunately, that is not currently the perception we see when meeting with potential tenants.

In addition, the mitigation plan to account for NWIW's in-state emissions is comprehensive and sets a new standard for how Washington State can be a national and international leader in creating a sustainable economy.

Since 1921, the Port of Longview has relied on the Columbia River system for its livelihood. And today, the Port continues to rely on it to support nearly 20,000 jobs, \$34 million in state and local taxes and \$2.9 billion in overall economic value for its community. From strong environmental practices and economic prosperity to protecting health and safety, the Port of Longview Commission and staff unanimously urges the SSEIS to be finalized without further amendment and the permits for this project to be approved.

Sincerely,

Allan Erickson
Commission President

Jeff Wilson
Commission Vice-President

Doug Averett

I have been reading about the proposed methanol plant that may be built in Kalama, WA. My understanding is that this facility will be processing fracked natural gas, to be made into methanol which would then be shipped to China, where it would be used in the manufacture of plastics. I do not think this is a good plan for several reasons:

1. The source of the natural gas—fracking—is a major concern. The chemicals used in fracking are toxic, and once they go down into the ground they are irretrievable. This means they could be contaminating groundwater into the distant future. Capped wells also leak methane-- a compound that traps forty times more heat than CO₂. I believe we have a responsibility to discourage fracking.
2. The CO₂ generated by the trains that bring the fracked natural gas to Kalama must be taken into account, although it doesn't show up in the articles I have read. The CO₂ generated by the ships that take the methanol to Asia is another factor that needs to be considered, along with the CO₂ used in the plant's construction.
3. I imagine jobs for the people of Kalama will be a big issue, and Northwest Innovation Works, which is proposing this methanol plant, will no doubt be pitching the job issue to county officials and the Kalama Chamber of Commerce. There is a short-term appeal to new jobs, but many of the jobs are likely to go to outside people with the skills needed to build a complicated processing plant. In the long run, the local people are likely to suffer the higher rates of cancer and other diseases that many people in Louisiana suffer who live near petroleum processing plants. Those who make the real money will be far away from the Kalama site.
4. The Columbia River itself also has to be considered, and it is of interest to Oregonians as well as Washingtonians, since it borders both states. By the time it reaches Kalama, it has been dammed fourteen times. It takes in the treated sewage of many towns and cities. It takes in the effluents from paper mills, farms and streets from hundreds of towns and cities in the greater Columbia River watershed. Yet the lower Columbia River is still a prime area for wildlife. How will this methanol plant affect the last portion of the river?
5. Finally, I just heard that China has pledged to have a carbon-neutral economy by 2060. That is admirable, especially since the USA has made no such pledge. However, the carbon a country generates outside of its own borders does not count, so China would be "farming out" its carbon emissions to our country, and this puts us in a position similar to that of many "developing" nations, doing the developed world's dirty work.

WA State Department
of Ecology (SWRO)

Dear Mr. Doenges,

I am Deena Tyrrell Grossman writing from Portland, Oregon, less than 35 miles from Kalama, Washington. Thank you for taking public comments on the second greenhouse gas analysis, NWIW Kalama fracked-gas to methanol refinery.

We can't breath!

This week Governor Jay Inslee wrote a letter to President Trump, saying:

"It is time to abandon the disastrous course that now envelops us in smoke and ash. Rapid climate change driven by human activity has created a fusion of natural risk and man-made catalysts to accelerate these unnatural disasters. Your reckless statements that climate change is a hoax and your gutting of environmental policies benefit no one but fossil fuel companies. Deliberate and decisive action must be taken on a global scale with the United States in the lead."

NWIW SEIS tries to whitewash the issue of greenhouse gas emissions exceeding 40 million tons per year from the proposed Kalama fracked-gas to methanol refinery. Their straw man argument pits these numbers against even more enormous imaginary numbers if the plant were built elsewhere. This is a form of environmental blackmail, essentially saying, "If you don't let us build this polluter here, our corporation or another one will build a worse polluter elsewhere." They insist it has to be built and they are wrong. It does not.

NWIW says it has to be built because the world needs more methanol for plastic and fuel. The sheer amount of plastic waste choking our oceans and piling up on the earth is yet one more environmental catastrophe they want to perpetuate and enlarge. NWIW, A Chinese government fossil fuel corporation, would become the single largest greenhouse gas polluter in Washington.

Please, people of Department of Ecology, lead us to a future of clean air we can breath, cool, clear water, thriving forests and healthy communities for your sake, for all our children and grandchildren. Please take the path to reducing greenhouse gas pollution and take your own mission statement to heart:

Protect, preserve, and enhance the environment for current and future generations.

Oppose actions which will intensify the environmental destruction of our beloved Pacific Northwest and deny permits for building the world's largest fracked-gas to methanol refinery in Kalama. Thank you sincerely for your attention.

To Richard Doegnes;

These letters are from the children who will inherit whatever it is we leave them.

These last weeks, with fire, smoke, hurricanes, flooding, have gone on what feels like forever. This is climate change.

Not building a methanol plant in Kalama will not solve what our planet is facing, but it's a start. We have to adapt to climate change. If we do maybe these children will have a chance to maybe even a better life than we have had.

Please do not build a methanol plant in Kalama. (By the way, I'm 73 years old)

Thank you.

Dear Mr Doenges,

I urge you to put a stop to the Kalama Manufacturing and Marine Export facility. This plant cannot be allowed to be constructed as it will increase the states greenhouse gas emissions by almost one million tons. This proposal does not take into account the adverse effects on water quality, fish and wildlife health. Nature is a finite resource that must be preserved, not destroyed. This will damage the delicate ecosystem of the Columbia river. The most alarming of all man's assaults on the environment is the contamination of air, earth, rivers and sea with dangerous and even lethal materials.

Sincerely Jane Yarrick
JUNE YARRICK

9-15-20

Dear Dept. of Ecology;

The Methanol Plant that NWIW wants to build in Kalama will be a mega-polluter for its entire life. Washington cannot contribute to the goal of keeping global warming "well below 2 degrees Celsius" by allowing major polluters to increase our state's fossil fuels contamination. A low-carbon future demands investment in lower-emitting production processes. Comparing coal-based, oil-based, or gas-based pathways as NWIW is attempting to do, is outright misleading for assessing the need to steeply reduce global emissions altogether. The use of all fossil fuels is only making our climate crisis worse, creating bigger storms and fires, longer droughts and more extensive pandemics.

Ecology's analysis also fails to consider how dumping high-polluting methanol into the market could negatively impact a transition to cleaner transportation alternatives and vehicle electrification. Ecology should base its permit decision on the known dramatic pollution and damage caused by fracking gas, producing and refining methanol, and burning or using methanol to make plastics. The rest is largely speculation. Please deny the methanol plant permit.

Dear Mr. Doenges:

Sometimes the allure of perfection eclipses the possible. The dream of a giant leap threatens an incremental step.

Kalama Manufacturing and Marine Export Facility's Draft Second Supplemental Environmental Impact Statement demonstrates that KMMEF's proposed methanol plant is an important incremental step.

The Draft Second SEIS, using foreseeable variables and thoughtful and exhaustive analyses, demonstrates several things, among them:

1. KMMEF's proposed methanol production will reduce net GHG compared to filling the demand with available alternatives.
2. Worldwide demand for methanol is projected to increase over the next several decades.
3. Whether methanol is used as fuel or olefin production, KMMEF's methanol production is better for the environment than existing sources.

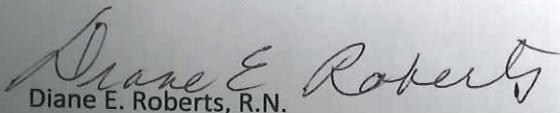

As health care professionals, we have previously looked carefully at the health effects of methanol manufacturing, reviewing the medical research over the past several decades. Because the toxic effects of methanol have been well documented and the physiology well understood, appropriate safeguards limiting exposure have long been in place. As long as these are maintained, the process is safe both for employees and for the community.

As environmentally sensitive retired physician and nurse and former Kalama residents, it is apparent to us that KMMEF has made a compelling case that its planned facility will result in less global GHG emissions and deserves ecology's approval.

Sincerely,

Daniel D. Roberts, M.D.

Diane E. Roberts, R.N.

Rich Doenges re: NWIW SSEIS
Washington Department of Ecology
Southwest Regional Office
P. O. Box 47775
Olympia, WA 98504-7775

Dear Mr. Doenges,

The proposed Kalama Manufacturing and Marine Export Facility to build the world's largest fracked gas-to methanol refinery exporting product to China is of grave concern to me and my family, to the State of Washington and to the residents of Kalama because life on this planet is being impacted by global warming, a very real event. The methanol refinery is of concern to me personally as I own three fourplexes in Kalama and landlord to 12 families, many of which are single women and some with children. I am concerned for their health and welfare and for property values. Kalama is not a refinery city. It is a quaint waterfront town on the Columbia River with a port, light industry, small town cottage industry and surrounding Cascade outdoor recreational areas.

My professional experience since 1970 in the maritime field of international trade and transportation and as the Director of Marketing for the Port of Longview from 1991 until retirement in 2008 took me to ports all over the world. I am very familiar with most ports in the Pacific Northwest, their challenges and their good news. I believe the Port of Kalama is making a big mistake in fostering green house gas emissions (GHGs) putting the Columbia River and the global environment at risk for the economic benefit of China. For a decade the citizens of Washington have been fighting hard to keep fossil fuel exports from taking a foothold in our state and on the Columbia River. Methanol is no different and should not be permitted as was the case for coal exports.

When the current President of the United States withdrew our nation from the Paris Agreement to counter global warming, the Governor of the State of Washington along with other Governors committed to a U.S. Climate Alliance to take up the challenge to reduce GHGs. I am committed to this endeavor and fully support whatever we (the State of WA) can do to beat the clock that is ticking to keep the planet from warming 2 degrees F. The recent wildfires in CA, OR and WA have caused widespread loss of property, loss of life and irreparable damage to people's lives. Science is saying that global warming is the primary cause. The economic impact of wildfires should be considered in the evaluation of GHG emissions put out by the refinery. How can we expect the climate over the next 40 years, the lifetime of the refinery, to be any different if fossil fuel refineries are allowed to proliferate or coal fired power plants are not shuttered? No, in fact, likely worse.

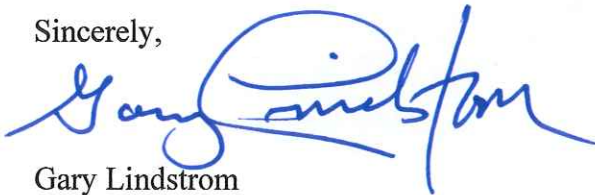

Ecology's analysis showed that the KMMEF refinery would produce 4.6 million metric tons of carbon pollution annually. It could be more, as much as two times? Proponents initially stated that the product would be used to make olefins, plastics. Then there was a serious finding that the product would really be used in the fueling of vehicles. Once the product is on board ship and departs to international waters there is no way to control its final use. China (the government) will decide the final use of valuable energy resources. In fact, it would be best for Ecology to assume that all of the 10,000 MT per day of methanol production would be used as fuel for vehicles thereby increasing GHG emissions.

From fracking, upstream emissions, plant emissions, and downstream emissions methanol exports to China should be considered too dangerous for the local environment, the Columbia River and too toxic for the planet's fragile atmosphere. Our lives are insulated from the perils of the sun by a very thin layer of atmosphere. We must do all possible to keep that thin veil intact.

I ask Ecology to find that the refinery's output of GHG's is beyond the threshold in our State's passionate commitment to fight climate change and to therefor deny the shore line permit application for KMMEF.

Thank you for the opportunity to address this vital issue before the Department of Ecology.

Sincerely,

Gary Lindstrom

To: Washington State Department of Ecology c/o Rich Doeges

Thank you for the opportunity to comment. Thank you for requiring the SEIS be redone. Thank you for the changes made.

I am very much against the building of the Kalama methanol refinery because we are in a climate crisis and must stop our use and worldwide use of fossil fuels as soon as possible. I love hiking, kayaking and studying nature. Therefore, I am a member of the Audubon Society, Sierra Club and Columbia Riverkeepers and other outdoor groups. My daughter-in-law's family lost a beloved home this month to fire in Oregon but this is nothing compared to the devastation experienced by so many worldwide due to a warming climate.

Please revise your methane leakage rates to 1 to 3% to align with current findings and the Stockholm Environment Institute. 1% leakage is far below what should be expected. As you are familiar, the Stockholm Environmental Institute wrote (SEI-1800-db-towards-a-climate-test) "the US Department of Energy estimates that an average leakage rate for natural gas supply systems nationally is 1.6%"...However, research based on atmospheric measurement suggests that bottom up estimates...consistently under estimate methane emissions. Brand finds leakage could be 25-75% higher than inventory based estimates which would mean leakage rates of more like 1.5 to 2.6% for the US average." Rodney Mountain was found to be 2.8%; global average is accepted at 4.3% for shale gas production. SEI concludes that 1-3% leakage would be plausible for the Kalama methanol refinery.

Downstream impacts for the methanol refinery should assume that all methanol produced will be burned. We do not know the end use; China can use it in any way desired. Even if a percentage is used to produce plastics, the plastics will most likely also be burned. Similar to the purchase of insurance, it is imprudent to plan for less than the worst case scenario. 100% eventually burned is likely. There is no evidence that 40% of methanol will be burned.

Looking at the big picture, the refinery would encourage significant fracking at a time when it is imperative that the world reduce use of fossil fuels. The project would likely necessitate an additional north-south pipeline which in turn encourages more fossil fuel extraction. Increased extraction of fossil fuels violates Washington clean energy goals. Increased extraction will likely soon violate national goals. It is wrong to accelerate harm to the people and species of the world by increasing fossil fuel extraction and infrastructure. It is wrong to be party to the effects from the refinery and the acceleration of storms, fires, droughts, political unrest, climate refugees, expense...

The portion of the draft second SEIS which deals with displacement of dirtier methanol production in China should be eliminated. It is far too speculative with no evidence. Also, it sets a precedent for future projects to request approval on the basis that there exists a more polluting method which could be displaced.

In its present form, the second SEIS clearly shows a significant, unmitigatable increase in global greenhouse gas emissions. It is morally wrong for Washington and the USA to be a partner in this increase. Please deny the shoreline substantial development and conditional use permit on the basis of unacceptable greenhouse gas emissions.

Kristin Edmark

Comment regarding mitigation of greenhouse gas emissions

WA State Department
of Ecology (SWRO)

To: Washington State Department of Ecology
c/o Rich Doeges
Washington Department of Ecology
PO Box 47600
Olympia, WA 98504-7600

Thank you for the chance to comment. The section of the draft second SEIS which deals with mitigation is not workable because 1) The plan is too vague. 2) The project is too large to mitigate. 3) NWIW and Port of Kalama have repeatedly shown they cannot be trusted with monitoring.

The mitigation plan is unclear. As written, it is unlikely the components of the plan would be in place and working before any methane is produced. No methane production should be allowed without equal mitigation. Even funding for the salaries is unclear. The Department of Ecology or other state organizations should not be expected to donate time to NWIW.

I do not believe it is possible to mitigate a project of this magnitude. As the draft second SEIS clearly shows, the project has significant upstream and downstream emissions. A plan which mitigates only emission in Washington State does very little to mitigate the full effect of this project and should not be considered mitigation. Real mitigation can only be done by removal of CO₂e from the atmosphere. Most assuredly, NWIW does not plan to plant enough trees to remove that enormous amount of CO₂e and certainly would not wait until the trees were large enough to sequester equal CO₂ to the CO₂e produced. Even if enough trees could be planted worldwide to mitigate the greenhouse gas produced, the warming planet is increasing the numbers of trees burning each year. Proposing to mitigate by other means like contributing to a wind farm or battery plant is not acceptable and will not prevent acceleration of warming.

Mitigation involves monitoring emissions. An outside entity must do all monitoring. Some examples of ways NWIW has shown that they cannot be trusted include:

1) The unacceptable SEIS from 2019 concluded that the methanol refinery would decrease greenhouse gas emissions worldwide based on too many unfounded unpredictable assumptions. Only data which would support their desired conclusion was used. NWIW continues to state that the refinery will decrease world greenhouse gas emissions.

- 2) The 2019 SEIS repeatedly dismissed, discounts or leaves out methane leakage from drill sites, pipelines, pump stations and transport including such statements as: 1.2.1.2 "There are no permanent sources of operational emission for the proposed pipeline with the exception of minor fugitive methane emissions".
- 3) NWIW insisted for years that the methanol would be used only for plastics until the evidence (the Powerpoint presentation to investors and statement by Mr Lebin) proved this was false.
- 4) The large amount of conflict of interest NWIW promotes is unethical. NWIW hired Richard DeBolt, a ranking member of the Washington State Capital Budget Committee. DeBolt is NWIW Director of External Relations. \$143 million in tax loopholes have been negotiated with the State of Washington; \$11.5 million for the dock and road has been in the state budget; Washington Public Employees' Retirement Funds are to be invested in NWIW through Stonespeak. NWIW has also hired Rick Desimone, a former Chief of Staff for Senator Murry for advisor, George Raiter, a former Cowlitz County Commissioner, as an outreach director. Gary Locke, a former Governor, as Chairman of an advisory board for NWIW, and two members from the Center for Urban Waters, Tom Luce and Rick Desimone.
- 5) NWIW violated Washington State public meeting laws. At the Dec 13th 2018 hearing on the draft supplemental EIS about 1000 members of the public came and almost 500 signed up to speak overwhelmingly against the refinery. Washington law requires the public free access to public hearings but on 12/13/18 we were asked to wait in a 45 minute line to provide name and address to enter the building. Since the hearing was only 3 hour long and there was a break the last 10 minutes of each hour, some members of the public missed almost the first 1/3 of the hearing before being allowed to enter. I was one of the many who prepared a comment and asked to speak but was not allowed time under the lottery system used.
- 6) NWIW/Port of Kalama sent a letter of support to the BUILD grant from the Cowlitz County Board of Commissioners. The Port of Kalama/NWIW conducted County Commission business at odd unannounced meetings. At the regular public Cowlitz County Commissioner's meeting, July 3rd, 2018, the vote on the endorsement letter for the grant application was included as "consent agenda" meaning when the agenda was approved so was the letter. Public comment was only allowed after the vote. The letter was pushed through quickly; Commissioner Axel Swanson admitted at the meeting that he had not read and did not know the contents of the letter.
- 7) In 2019, the NWIW website listed the average salary (to the penny) for employees once the refinery is operational. The average is misleading because it includes the high salaries of the executives. NWIW has applied for at least 4 visas for Chinese employees.

The mitigation plan presented in the draft second SEIS should not be accepted because it is nowhere near adequate, incomplete and does not include trustworthy monitoring. To leave it in as is makes it seem that the plan has validity; so the entire mitigation section should be rejected. Please deny the shoreline substantial development and conditional use permit on the basis of unacceptable, unmitigatable greenhouse gas emissions.

Kristin Edmark

Julie Martin

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

DeeAnna Holland

I actually live just a few minutes away from the proposed location which means I will have to experience whatever pollution and damage this facility will create. It was bad enough growing up across the river from an active nuclear power plant and the daily threat that it could fail, I would rather not live with another ticking time bomb minutes from my house.

Catherine Bax

Thank you for the opportunity to comment on this very disturbing project that is being pursued by Northwest Innovation Works (NWIW) in Kalama. My name is Catherine Bax. I am a retired medical professional and a resident of Oregon.

I do not want to see this methanol refinery built because it would be a huge emitter of greenhouse gases and cause further warming of our planet. NWIW's fracked gas to methanol refinery would cause millions of tons of greenhouse gas pollution. The refinery would use more fracked gas than all the gas-fired power plants in Washington, combined. And the refinery would induce new fracked gas pipeline expansions throughout the region. This is a huge project that will cause huge amounts of pollution and environmental degradation to our area in order to ship methanol overseas to be used to make more plastics or to be used as fuel.

The only path forward for our long-term survival on this planet is a low carbon future. The vast majority of scientists who study climate change and our experience as people in the 21st Century tell us this. Washington state has set some thoughtful clean energy and climate goals. This project is not consistent with those goals. NWIW's refinery would produce 4.6 million tons of greenhouse gas pollution each year, for 40 years, a staggering quantity of pollution that will undermine Washington's greenhouse gas reduction goals.

The idea that a NWIW methanol refinery in Kalama, Washington could produce less pollution and GHG's than another high carbon factory somewhere else (in China?) is speculative, tenuous and ridiculous. A project (Kalama Methanol Refinery) that will produce tons of pollution, but less than an existing project that is producing more pollution is not a good reason to go forward with the project (Kalama Methanol Refinery) that produces tons of pollution. You can always find something that is worse than the terrible thing you want to do. Neither project is acceptable. Future energy needs do not need to be met by fossil fuels. There are alternatives if you and I demand them. Kalama needs economic stimulus and good jobs for the people who live there. But projects that profoundly contribute to global warming, ocean warming and rising shorelines are not the answer for Kalama, for Washington State, for the Pacific Northwest or for the planet. There are alternatives if we demand and support them.

I implore you, The Washington State Department of Ecology, to reject NWIW's methanol refinery project and to deny the Shoreline permits for the project.

Catherine Bax

Don Steinke

To recap:

The DSSEIS for Kalama methanol:

Relies on a trust that other countries will not establish policies that alter the market for energy and plastic.

Fails to recognize that countries around the world are banning various types of plastic.

<https://www.theladders.com/career-advice/14-unexpected-countries-that-have-banned-single-use-plastics#:~:text=Rwanda,ban came into full effect>.

Fails to recognize that California now requires 50% recycled content in soda bottles.

Does not verify assumptions of methane leaks from pipelines

Does not account for abandoned wells that will leak methane forever.

Does not acknowledge that pipeline companies don't bother to repair pipeline leaks promptly unless there is a threat to public safety.

Does not acknowledge that China is committed to begin reducing emissions in 2030, and be carbon neutral by 2060.

Does not consider Inslee's Clean Air Rule

Does not consider HB2311, which establishes a state goal of 45% below 1990 levels by 2030.

Does not account for the emissions associated with ships while docked.

Linda Horst

Note to Ecology:

Admittedly, the following comment listed below does not critique GHG emissions, displacement or mitigation issues. My comment will, however, address the bona fides, or lack thereof, for Northwest Innovation Works to reliably and fully implement during the next 40 years their commitments contained in the DSSEIS: lowering GHG emissions; displacement of other dirty fuels; and 100% mitigation of all in-state direct/indirect GHG emissions.

The saying "All hat, no cattle" comes to mind when I consider the role of Northwest Innovation Works in their high-stakes, paper shell game they are waging with Ecology in this Draft SSEIS process.

While Ecology has invested considerable time and money researching and analyzing the myriad aspects and ramifications of this proposal, alarmingly zero attention has been devoted to the qualifications of the proponent of this climate/life altering refinery!

It is unconscionable that this upstart company that has never built a methanol refinery, never operated a methanol refinery or ever produced a drop of methanol is, in fact, proposing to build, operate and produce methanol in what would be the largest fracked-gas-to-methanol refinery in the world! Too ludicrous to be true? Tragically it appears not to be too ludicrous for every governmental agency in Washington state that has been tasked with reviewing this proposal for the past 6 years!

How did this meritless company get this far?

NORTHWEST INNOVATIONS WORKS LLC:

- No employees—according to WA Secretary of State, NWIW Kalama LLC has no active license with L & I—no covered employees
- No income—since forming their LLC, zero income from methanol sales
- No assets—business office rented not owned
- No credentials—no documentary evidence
- No experience building a methanol refinery
- No experience operating a methanol refinery
- No EPA approval for the ULE technology proposed to decrease GHG emissions
- No methanol refinery has ever used both ULE and ZLD technology together

They say "The devil is in the detail". The preceding "No—" details are red flags I trust Ecology will

not ignore.

There are all most as many red-flag comments submitted against this refinery proposal as red-shirted "No Methanol Refinery" opponents! All of us urge you to deny this permit.

R. David Goldberg

"The accelerating threat of climate change and the emerging science on the damaging impacts of natural gas production and distribution mean we must our full efforts on developing clean renewable, and fossil-fuel free energy sources."

-Gov. Jay Inslee
May 2019
Coming out against
the Kalama methanol
project.

Washington state has plans to reduce GHG emissions 45% below 1990 levels by 2030 and 95% below 1990 levels by 2050. To have a chance of hitting these goals it is necessary to find cleaner, renewable alternatives to fossil-fuels. This kind of thinking is necessary for solving the climate crisis. But it is the kind of thinking absent from the Kalama SSEIS when it states it is "not possible" to consider possible alternatives to the use of methanol. The SSEIS feels confident in predicting market trends 40 years out but is blind to Chinese policy makers setting different goals in the near future. Case in point: the Chinese government recently announced the goal of becoming carbon neutral by 2060. The market displacement theory put forward by the SSEIS is the current status-quo. But we need bold visionary thinking to solve the climate crisis. Too bad that thinking isn't coming from the Washington Department of Ecology.

William Forbes

There is no excuse for building more plastics manufacturing infrastructure when there is no longer any way to recycle plastics! This is clearly unsustainable and Washington deserves better. It's as simple as that. Just look at your own weekly trash and how much volume is plastics that can no longer be exported to other countries for processing and reuse. Exporting methanol to other countries just creates more global waste! Stop it - now!

Subject: Don't allow the world's largest fracked gas-to-methanol refinery to harm our climate and Kalama -- Kalama Manufacturing and Marine Export Facility Second Supplemental EIS

To Washington State Department of Ecology:

I strongly urge Washington State to reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama, Washington.

"Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose and method."

-- Theodore Roosevelt

The project would use more fracked gas than all of Washington's power plants, combined. The company has sought to mislead regulators and the public about the purpose and impact of the refinery, falsely claiming that the project will displace "dirtier" forms of fossil fuels. We know that fracked gas is a potent greenhouse gas pollutant, and we are counting on Ecology to accurately account for the project's upstream emissions as well as the downstream pollution from the likely combustion of NWIW's methanol for fuel.

"As we peer into society's future, we--you and I, and our government--must avoid the impulse to live only for today, plundering for our own ease and convenience the precious resources of tomorrow. We cannot mortgage the material assets of our grandchildren without risking the loss also of their political and spiritual heritage. We want democracy to survive for all generations to come, not to become the insolvent phantom of tomorrow."

-- Dwight D. Eisenhower

For the community of Kalama and for our climate, the risk is simply too big. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution. We are counting on you to stop this dirty and dangerous project.

"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."

-- Aldo Leopold

Thank you for your consideration of my comments. Please do NOT add my name to your mailing

list. I will learn about future developments on this issue from other sources.

Sincerely,
Christopher Lish

David Hupp

Washington State Department of Ecology:

I testify again in opposition to the proposed Northwest Innovation Works (NWIW) Kalama Manufacturing and Marine Export Facility in any form. NWIW proposes a similar facility in Oregon and I oppose that as well. This is a followup to my first comment, dated September 19, 2020. This comment again refers to the "Draft Second Supplemental Environmental Impact Statement", Publication 20-06-011, dated September 2020.

The entire document, but particularly the sections dealing with economics (the profession in which I was trained) is written with slick, but dehumanizing language that reminds me of a quote I encountered a couple of years ago:

""Spills can have both positive and negative effects on local and regional economies over the short- and long-term ... spill response and clean-up creates business and employment opportunities for affected communities The net overall effect depends on the size and extent of a spill, the associated demand for clean-up services and personnel, the capacity of local and regional businesses to meet this demand, the willingness of local businesses and residents to pursue response opportunities."

Source: "Trans Mountain [oil pipeline] Expansion Project, Risk Assessment and Management of Pipeline and Facility Spills", volume 7 of Kinder Morgan's Application Pursuant to Section 52 of The National [Canada] Energy Board Act proposing to triple pipeline capacity.

This absurd statement is manufactured by people who have lost their humanity. The sort of "economics" perpetrated in the second draft SSEIS connects to another absurdity inherent in this market-fundamentalist economic philosophy: the national accounts (e.g. Gross Domestic Product) reckon a polluting manufacturing process productive, with no subtraction for the human and community harm caused by the pollution. If the pollution is cleaned up, that also is considered productive. Thus both the process producing the pollution and the process for cleaning it up are "income".

The economics philosophy behind the SSEIS is rancid and inhuman and leads to great harm. The NWIW promises of "jobs" and "mitigation" should be seen in this light.

M Judith Ferguson

Director Watson, Regional Director Doenges and Department of Ecology staff –

Thank you for your issuance of a 2nd SEIS on the Northwest Innovation Works (NWIW) Methanol refinery in Kalama after finding the project's initial submissions inadequate and inaccurate. I have read the document. As a resident of Tacoma in close proximity to the original Methanol refinery siting, I am more than aware of NWIW's modus operandi and am very sorry to see that their misleading and speculative theories of operation have changed very little over the last 6 years- - while during this same time span much has been revealed regarding the negative climatic and environmental impact of fracked gas. Building the world's largest fracked gas-to-methanol plant in Washington State does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Its current siting on the Columbia River at Kalama is as inappropriate and outrageous as its original siting in the Port of Tacoma was.

My fervent hope is that your Department will reject the project and deny Shoreline permits based on your new analysis, as well as the 'climate change' summer we have experienced this year - from the wildfire devastation on the west coast to the hurricane and derecho destruction in the Gulf and Midwest. It is an unfortunate truth that NWIC is a Chinese owned company that lies to regulators and the public. They enticed the Port of Kalama and Cowlitz County to sacrifice the health, safety and long term viability of the Columbia River ecosystem for profits and promises that may never be realized. NWIW cannot be trusted to mitigate negative impacts of this fracked gas refinery. The fact that this project had to abandon its initial Tacoma siting due to outspoken community opposition and is facing equal opposition and additional reviews in Kalama is a 'red flag' indicator that there is something wrong with it at its core. I appreciate that you addressed the likelihood that methanol produced in Kalama will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public that it would be used solely for plastics manufacturing.

Your new SEIS analysis reveals what the NWIW backers have long denied - that the refinery would cause more methanol to be burned as fuel in China and result in significant methane pollution from fracking. The methanol refinery would quickly become one of Washington's most significant sources of climate-changing pollution and use more fracked gas than all of Washington's gas-fired power plants combined. If built, our state will be locked into decades of additional climate pollution, even though we know it's past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

When I read the Public comments of so many others who are equally concerned, I feel hopeful. The pandemic has impacted systems and business practices across the board, as well as altered assumptions at many levels. Uncertainty and volatility abound in energy market dynamics, and the predictability of global fuel markets, technology development, consumer behaviors or regulations of any kind are equally uncertain. For those same reasons, one must not expect that what NWIW states they will or won't do will actually come to fruition. Talk is cheap and actions speak louder than words.

I am concerned that your SEIS provides too little detail on the actual mitigation that would be accomplished within the VMPF framework – and concerned that NWIW is the 'architect of the voluntary program.' Does this mitigation address the full impacts of NWIW's overseas emissions?. Without defined benchmarks to achieve, it can't be expected that NWIW will address issues in a forthcoming, transparent manner. Once in operation, the NWIW's working relationship with the State of Washington could abruptly change, as could the plant's operational plan. Promises to the community and State regarding mitigation, etc. could easily be dismissed and abandoned.

I do have four questions/concerns that I would like you to consider:

#1 - Have emissions from activities at the adjacent dock and wharf site been included in your analysis?

#2 - In regard to SW Washington Clean Air Agency, will they be monitoring the cumulative emissions of the methanol refinery in conjunction with the emissions of the other commercial industries in the area? It is my understanding that Puget Sound Clean Air Agency in my Port of Tacoma area monitors only individual emissions of each facility and does no monitoring of the cumulative emissions in the air. In addition, the Agency only monitors certain emissions and not all emissions. It may be that the list of monitored emissions needs to also be updated as the current list may not be capturing newer pollutants. I assume that such an update would need to be instigated by the State of Washington.

#3 - Wilma Subra spoke in Tacoma in 2016 regarding the initial proposed plant and expressed concern regarding the measuring of emissions during startups, shutdowns, testings and flarings. Will all emissions during these procedures be monitored or will some be 'self reported' or not reported at all? It's my understanding that these types of emissions do happen on a frequent basis and are most likely not reported. I would hope that their reporting would be mandated. NWIW's 10/30/2019 letter to Dr. Placido is vague to me in its 'mitigation list of emissions' on page 2.

#4 – September 2020's week of hazardous air quality throughout the region due to smoke and an inversion layer may be a precursor of events to come. What regulations will be put into place to ensure that the Methanol facility does not contribute to increased human health risks in similar situations? Will a facility shutdown be mandated in such circumstances?

Should this Refinery be completed, a local ecosystem will be forever altered - - this time by a Refinery that will be the largest in the world and whose operation will contribute millions of tons of greenhouse gas pollutants yearly for 40 years. It is profoundly inconsistent with achieving Washington's climate goals.

Thank you again for initiating a 2nd SEIS on the Methanol facility. I appreciate the opportunity to share my concerns about this Refinery yet again. I do hope that you will deny the Shoreline permit. The Methanol refinery is a project that was/is a bad fit for both the Port of Tacoma and the Port of Kalama.

Kathy Boylan

My sister and I are sending you a strong message about Kalama. Stop the project, save the salmon, save the environment!

Joana KIRCHHOFF

Stop Kalama and stop environmental degradation!!!

Bob Carroll

I am in favor of the NWIW Kalama Methanol project. the science shows that methanol (which we have need of) will be produced with no liquid discharge and severely reduced emissions. it is better to produce it here in this way instead of it being produced using coal in china, and have the emissions blow over here anyway. it will also create good local jobs.

Cowlitz Indian Tribe

My name is Celine Cloquet. I'm an elected council member of the Cowlitz Indian Tribe. The proposed Kalama methanol manufacturing and marine export facility lies within our homeland. The Cowlitz tribal council has determined that this project is inconsistent with the tribe's stewardship ethic, and today, force our opposition to this project moving forward. The Columbia River's ecosystem including floodplains, wetlands, aquatic habitat, and cultural sites are in a depressed state. As we stated in our testimony and letter to the shorelines hearing examiner in January 2017, the existing review documents under-represented the project's impacts. The Washington State Department of Ecology is responsible for ensuring shorelines compliance, critical areas protections, and floodplain management actions.

Our comments until now have focused generally on localized impacts. For the GHG emission review, we have attempted to take a broad view from many perspectives. The tribe considers the recent firestorms, flooding events, and other severe weather outbreaks demonstrate a clear link between global conditions and local impacts. The SSEIS does little to persuade us that this is a green project. While this project may move forward, its contribution to global emissions is still significant. Whether this project brings more vehicles to the road or more shampoo bottles that is supporting throwaway consumer culture, which is undermining our climate stability. We ask that the Department of Ecology review the project's impacts and findings relative to greenhouse gas emissions and mitigation carefully, thoroughly, and with an eye to the seventh generation.

In closing, the tribal council has concluded that the project's objective to produce methanol is not consistent without our belief that our actions are critical to our planet's warming trend. Thank you

Robert Wagner

Hello, I am glad The Department of Ecology extended the comment period giving me the opportunity to voice my opinion on this critical SSEIS. This is critical to me because I am concerned about the negative impacts of the NWIW methanol project on my community which is just nine miles away and it's impact on the Washington and the world.

I am not a scientist but I have reviewed the SSEIS as best I could and done some homework on some of it's conclusions. While there are many questions that the study answers and raises, I came away with two major concerns/questions.

First of all the study notes that the plant would produce 4.6 million tons of carbon emissions per year for potentially 40 years. It is my understanding that this would put it in the top ten of Washington industries that emit green house gases. To me this is totally inconsistent with our States goals of reducing green gases and the rate of global warming. Our State has pledged to work towards these goals but allowing this type of project makes the pledge hollow. Are we serious about our goals?

My second major concern is the lack of commitment and/or a plan that NWIW has for mitigating the impacts of it's plant. To me this would be a critical element of the SSEIS and leaving it vague and voluntary is a recipe for disaster. Apparently NWIW has already been less than honest about it's intent for the uses of the methanol, plastics or fuel, and so nothing should be left to chance.

In closing I believe it is in the best interest of my community and my State that your department deny the shoreline permit for the NWIW project. This project needs to be rejected if we truly want to protect our local and global communities.

Sincerely, Bob Wagner, Longview Washington

Sally Keely

DSSEIS Table 3.5-11 states KMMEF will emit approximately 4.6 million metric tons of CO₂e per year, every year, for the 40 year planned lifetime of the Kalama Methanol Refinery. There is simply no way to mitigate this level of climate pollution. Per the U.S. government's own GHG equivalencies calculator at <https://www.epa.gov/energy/greenhouse-gas-equivalencies-calculator> (screenshot attached) this is comparable to burning over 5 billion pounds (that's billion with a B) of coal, per year, every year, for 40 years. Is this what Ecology wants? Is this what Gov. Inslee wants? Is this what the people of Washington state want? NO, of course not! NWIW = Not What I Want. We all need to REDUCE our GHG emissions not massively increase them. This level of emissions added to our already swollen carbon footprint would be a death sentence for our citizens, young and old. Do not permit this insanity. DENY shorelines permits.

Ron Lee

My name is Ron Lee. I'm an 18-year member of the Operating Engineers Local 701. I'm in support of the project. I appreciate the review done by the Department of Ecology, and I'm concerned about those who want to ignore the science. I believe more than enough study has been done. I ask and encourage [inaudible] it is time for the department to permit this project to proceed. Even this more conservative study sets a clear picture of the benefits of the project, both on a statewide basis and globally. Please proceed swiftly to [sound cut] allow positive impacts.

Thank you, Department of Ecology. Good work. Please move swiftly.

Jordan Van Voast

My name is Jordan Van Voast. I'm a licensed acupuncturist and member of 350 Seattle. I urge you to reject the permit application for the Kalama Manufacturing and Marine Export Facility, which is based upon a flawed and incomplete analysis of negative impacts not only to the local environment, but to the global climate. 2020 is on track to be one of the warmest years on record. This summer's historic wildfire season with mega fires still burning in California, Oregon, and Washington have thus far killed at least 37 people, burned six million acres and blanketed hundreds of thousands of square miles with a plume of thick, toxic smoke that was tracked as far as Europe; 5,000 miles away.

Health experts recommended everyone in Seattle to stay indoors for 11 days. But even with high-quality indoor air filters, many of my clients reported negative effects. How many people living unsheltered died or are still ill from the smoke? Nobody tracks those numbers so we will never know. These fires are a direct consequence of human-caused climate change, and the impacts are always going to be inequitable.

The proposed construction of this facility contradicts Washington State's climate goals and will accelerate the climate emergency. As we enter the Anthropocene, when actions of decision-makers like yourselves will determine whether human civilization will survive another generation or two, I urge you to listen to the cries of Mother Earth. Please act boldly and with conscience to reject this permit. Help Washington State become a true climate leader by exercising leadership while we still have a little time left. Thank you very much.

10/8/2020

Submitted by: Gloria Uhart, Kalama, WA

SUBJECT: Deficient KMMEF EIS Environmental Assessment and Risk Analysis

NWIIW's assertion that the KMMEF will not have an environmental impact on the indigenous people of Washington State is laughable. Although not a subject of review in this SSEIS, it is an open matter in the EIS and FSEIS and must be considered by Ecology in their decision. It appears only the Cowlitz tribe was included in the early discussions, but it was limited to the KMMEF facility and lateral project, not the potential impact of 185 MMTs of GHGs over 40 years to their native fisheries.

Chapter 11 of the Draft EIS addressed "Historic and Cultural Resources." The scope of the environmental impact was inconsistent with the culture and rights of the indigenous people as defined in multiple Washington treaties. On pages 17-123 and 17-124 of the FSEIS it states, "The NOI was published in the Federal Register and was mailed to approximately 300 interested parties, including federal, state and local officials; ... "potentially interested Indian tribes, ..." Based on the potential impact of the Native peoples' way of life all of the tribes in WA should have been notified, not just the two Washington confederated tribes (Chehalis and Umatilla Reservations) and the Columbia River Inter-Tribal Fish Commission listed in Chapter 18 (Distribution List) of the FSEIS. The other tribes are in Oregon (Grand Ronde, Siletz and Warm Springs.) What was the logic in notifying these Oregon interior tribe confederations at the exclusion of notifying 16 Washington coastal and Puget Sound tribes, and seven Puget Sound interior tribes who depend on salmon and steelhead as a way of life?

There are 29 federally recognized tribes throughout Washington, consisting of some 140,714 Native citizens. The livelihood for many Washington Native people rely on fishing, agriculture and timber, as is with the Yakima Nation. Sea life and salmon are especially culturally and economically important for the Coast Salish people. Their dependence on the earth's resources was unrecognized by NWIIW in the FSEIS, and not even mentioned in the SSEIS. The GHGs spewed out by the KMMEF will impact nearly all tribes in Washington, but particularly the coastal, Puget Sound and Columbia River tribes due to increased ocean acidification and higher water temperatures.

The regulatory context used in Chapter 11 of the EIS was described as "the cultural resources within the Area of Potential Effect (APE) for the proposed project, and probable impacts on such resources." The APE used was the approximate 100 acres of the KMMEF building site, Kalama Lateral Project (the proposed pipeline), and proposed electrical service improvements. The cultural resources were as identified in a cultural survey using the Washington State Department of Archaeology and Historic Preservation (DAHP) database. There were no changes to Chapter 11 in the FSEIS. This is an extremely narrow scope considering that the increased GHGs, which will exacerbate climate change, will continue to affect Washington fisheries in Native American waters.

As described in the "Marine Spatial Plan for Washington's Pacific Coast (June 2018)," "the management of the marine environment is crucial to each of the coastal tribes, as the marine environment is integral to their history, culture, identity, and future. Marine resource management as a matter of law is shared

with the State and federal government. The MSP Study Area overlaps with 3,924 square nautical miles (67%) of the combined, adjudicated tribal fishing Usual and Accustomed Areas (U&As) and can be seen in Map 2 (next page.)

“Four counties (Clallam, Jefferson, Grays Harbor, and Pacific Counties) border the Study Area, along with the reservations of five federally-recognized tribes (the Hoh, Makah, Quileute, and Shoalwater Bay Tribes, and the Quinault Indian Nation) (Map 2). At the Study Area’s southern boundary is the Mouth of the Columbia River, the largest river in the Pacific Northwest with source waters from the Rocky Mountains. At the northern boundary is the Strait of Juan de Fuca, with source waters from Puget Sound and the Strait of Georgia (Canada). Two-thirds (67%) of the MSP Study Area overlaps with the Usual and Accustomed Areas (U&As) of one of the coastal treaty tribes – the combined area for adjudicated tribal fishing U&As is approximately 3924 nautical miles of the Study Area. The Makah U&A extends into the Strait of Juan de Fuca, which is not displayed on this map.)

Map 2: Cities, Coastal Tribal Reservations, and Combined Tribal Usual and Accustomed Areas (U&As)

- Washington Coastal Tribal Reservations (DNR)
- Incorporated City (WSDOT)
- County Boundary (DNR)
- Latitude and Longitude (ESRI)

- Washington MSP Study Area (State Ocean Caucus)
- WA State Boundary (NOAA)
- Combined Tribal U&As (NOAA Fisheries)

* This represents the combined U&A footprints, within the MSP Study Area only, for the Quileute, Quinalt, and Makah tribes. Each tribe's U&A varies within this area.

Map coordinate system: North American Datum of 1983 (NAD83), Washington South State Plane Coordinate System, meters. Not to be used for legal purposes.

Four of the five tribes adjacent to the MSP Study area signed treaties and include the Hoh, Makah, and Quileute Tribes, and the Quinault Indian Nation (referred to collectively as the coastal treaty tribes). The treaties with the Makah Tribe and Hoh Tribe, Quileute Tribe, and the Quinault Indian Nation govern the relationships between the federal government and the coastal treaty tribes. “Through signing those treaties, the treaty tribes agreed to allow the peaceful settlement of much of western Washington and ceded land to do so, in exchange for, among other things, their reserved right to harvest fish, shellfish, wildlife, and plants, and exercise other cultural practices both on and off-reservation. The treaties reserved the right to fish in “usual and accustomed grounds and stations” beyond a tribe’s reservation boundaries. Other tribes were recognized by the federal government through federal processes and maintain tribal reservations, but do not have treaties with the United States.

U.S. District Court and Supreme Court decisions (1974, 1979 and 1994), upheld the tribes’ treaty fishing rights, affirming the tribal right to harvest up to 50% of all fish, including naturally occurring shellfish and salmon within their respective U&As. The KMMEF, indirectly through its unmitigated GHG emissions and projected effects of climate change, will deny the tribes of Washington their fundamental treaty rights.

Furthermore, the In January 2017, the Makah Tribal Council approved the Makah Ocean Policy. The purpose of this Policy is to “protect and exercise the treaty-reserved rights and culture” of the Makah Tribe that are inextricably tied to the health of the ocean. The Policy acknowledges that in order for the Makah Tribe to preserve its treaty rights, “it is critical for the Tribe to be informed of, and actively involved in, decisions on actions that may affect the Tribe’s use of treaty resources or the health of the ecosystems upon which these resources depend (emphasis added.)” The Makah Ocean Policy contains consultation procedures that establish the requirements for when consultation is needed, including when it should begin, as well as pre-notification requirements, points of contact at the Tribe, and what is required of state and federal permitting agencies to initiate formal closure of consultation. (To obtain a copy of the Makah Ocean Policy, please contact the Makah Tribe, Rosina DePoe, Chief of Staff for tribal council).

In my quest for bringing facts to the table, facts that NWIW would prefer to obscure behind a curtain of deception, I read nearly 50 scholarly peer-reviewed research papers on the aquatic biodiversity of our oceans and the Pacific Northwest, and the effects of climate change on our fisheries. Ocean acidification and increasing temperatures are affecting the survivability of shellfish, salmon and steelhead in the Pacific Northwest. This includes the Pacific Ocean all the way to the coast of Alaska and the Bering Sea where salmon spend a good part of their time in the ocean. Our fisheries are not the only ones in decline. The 2020 salmon returns in Alaska so poor that many Alaskan communities are claiming fishery economic disasters and requesting government assistance. As of 8/12/20 all sockeye, chinook, pink and chum salmon fisheries are below projections, with some areas completely closed to commercial fishing. Bristol Bay appears to be the only area with good returns.

I reviewed the 2019 and 2020 Washington Coho Forecast Summary published by the Dept. of Fish and Wildlife. The forecasted and actual returns for hatchery and natural Coho salmon went from 2,013,316 in 2019 to 987,494 in 2020 (forecasted), less than half. Runs will likely be just above 50% of the 10-year average. Every production unit is forecasting significantly fewer natural fish. Although this is a

snapshot, and only represents one of the 19 species, the running 10, 20 and 30 year averages indicate nearly all species of salmon and steelhead are in decline. Many species will be on the edge of extinction by 2050 as a result of climate change, and here we are still considering the approval of a shoreline permit that will clear the way for a foreign-owned and operated GHG-emitting methanol plant to be built in our community at the expense of our economy and Native Americans. I'm in shock. What are we thinking? Ecology must deny the KMMEF shoreline permit.

Mark Uhart
LTC. USA Ret.
Kalama, WA

Vikki Nelson

My name is Vickie and I'm a new resident of Kalama and Cowlitz County. I am asking the Department of Ecology to reject this project. I am greatly disheartened to see that state and county officials clearly have no interest in protecting the residents this county, nor in providing safe long-term jobs and innovative and growing industries.

Northwest Innovation Works is a dubious company that is primarily backed by the Chinese government, and according to documents obtained by OPB, has been telling different stories to different interest groups. While it has been telling Washington officials that this plant would mainly produce plastic, it has been telling Chinese investors that it will play a large role in feeding China's insatiable fuel appetite. Company stakeholders are lying to US officials and fully intend to use this plant primarily for burning fuel, making this environmental assessment invalid.

Another issue is that the current pipelines that transport methane gas from Whatcom County lack the capacity to supply the plant. This means that an entirely new pipeline would need to be built along the length of I-5, requiring the use of eminent domain to remove citizens from their homes and significantly increasing the risk of methane leaks. According to a study done by the Environmental Defense Fund, a methane leak rate of even 3% would result in significant climactic damage. There are no reliable studies that show that any methanol company has been successful in limiting these leaks. Even the current DEQ study has estimated leakage rate of at least 3%, or about nine million cubic feet of methane per day.

Furthermore, this project is a dud and will not lead to long-term job growth or stimulus. Countless economists and studies have shown that there is a glut of fossil fuels on the market, and so many of them are struggling to be profitable that they must rely on taxpayer subsidies. Northwest Innovation is no different and has already applied for a two-billion-dollar loan guarantee from the US Department of Energy. By the time this plant comes online it will be losing money, leaving US taxpayers with the bill. Fracking in gas is on its way out; we should not be part of a dying and destructive industry.

Finally, methanol is a highly toxic flammable and volatile compound. It is not only capable of causing an explosion that would destroy the town of Kalama, but loose methanol can also cause toxic gas vapor clouds that can travel with the wind.

Diane Dick

2020 10 08 Comment #6

Washington State Department of Ecology
Olympia, Washington

Re: Formal Comments on Kalama Manufacturing and Marine Export Facility Draft Second Supplemental Environmental Impact Statement, September 2020

Please deny Kalama Manufacturing and Marine Export Facility (KMMEF) a shoreline substantial development and a conditional use permit. The environmental impacts from the project are significant and cannot be mitigated.

Greenhouse gas emissions are insufficiently explained in the draft second supplemental environmental impact statement (SSEIS) and the data contains errors and omissions.

The data on purchased power is incorrect and based on speculative assumptions.

Purchased power is detailed in Appendix C of the SSEIS and includes the following:

"Purchased power

The proposed project will import 100 MW (864,000 MWh) of electric power from the regional power market through the Cowlitz PUD transmission system during continuous operation. Power demand is reflected in Megawatt Hours (MWh). Total power demand is shown in Table C-17 for the ULE Alternative. Power demand over the 100 MW provided by purchased power is provided for by the on-site natural gas combustion turbines (emissions from the on-site power generation are captured in the ULE Production Scenarios)." P. C-20

"Electrical power demand

Electrical power will be required for KMMEF operations. A portion of the power required will be generated from onsite combustion turbines, and the rest, estimated to be 100 MW by NWIW, will be purchased from the power market. Emissions from electrical generation by the onsite combustion turbines are included in the emission calculations for methanol production for the ULE alternative. Emissions for the 100 MW of purchased power are based on three generation scenarios:

- Low Scenario. All purchased power is generated from renewable sources. The current renewable mix from Cowlitz PUD is 86% hydroelectric, 8% nuclear, and 6% wind.
- Mid Scenario. Purchased power is from a mix of generation sources, which changes over time in line with the expected, future energy mix in accordance with the Washington State Clean Energy Transformation Act (CETA) signed into law on May 7, 2019. In the mid scenario, generation from 2020 to 2030 is from the current marginal power source (defined as the source of electricity that is first or cheapest available to meet an increased power demand), generation from 2030 to 2045 is from a mix of 20% marginal power and 80% renewable power, and generation from 2045 and beyond is all from renewable sources.
- High Scenario. Purchased power is all from the current marginal power source.

A NW Power and Conservation Council study of CO2 emissions in the NW power system published in 2018 concluded that the expected emissions over the time frame of the project from

marginal power sources were in a range that correlates well with the emissions from a combined cycle natural gas-fired powerplant. Therefore, for the purposes of this study, a combined cycle natural gas-fired powerplant was assumed as the current marginal power source. Emission factors for combined cycle natural gas-fired powerplants, hydroelectric generation stations, nuclear powerplants, and wind turbines were derived from GREET and are shown below in Table C-1." SSEIS p. C-3

Table C-1 shows range of emissions from power purchases from low to high scenarios. [extracted data]

Purchased Power GHG Emission Factors (g/kwh)
CO2e 0.61 216.57 431.43

The 864,000 MWh from 100 MW demand for continuous operation is incorrect. Multiplying 24 hours of 100 MW demand for 365 days yields 876,000 MWh.

As noted in a previous comment, nowhere in the SSEIS are the electrical power requirements and sources for operating the KMMEF marine dock, including shore power provided to over 80 vessels at berth annually, evaluated. The GHGs generated from this power and marine dock vessel operation are not evaluated.

Based on scenario descriptions above, GHG emissions from on-site purchased power range from 526.7 for low estimate, 187,112 mid estimate, to 372,752 MT CO2e/year for high estimate per Table 3.5-2.

So which of the electrical power resource scenarios and resulting GHG emissions are most likely and reasonable?

All the estimates are low given the absence of including KMMEF dock operations and error in calculating the hours of operation in a year.

The low estimate is unlikely given a large new industrial load will not be allowed as a priority customer for Cowlitz PUD's hydropower resources. NWIW will be required to purchase power from the open market.

The mid estimate is speculative based on the ability of current electrical power resources to move towards clean and renewable resources. [It is also speculative dirtier generation from coal will be replaced by arguably cleaner gas generated electricity given the huge amount of gas NWIW will be sucking out of the limited PNW gas infrastructure.] It is speculative and dubious NWIW will even be operating at the farthest time frame that includes the cleanest power.

The high scenario, with estimate of 372,752 MT CO2e/year by using current marginal resources, is the most likely and reasonable number to work with.

To put the high scenario GHG emission number in larger context, the EPA GHG calculator states 876,000,000 kWh of electricity produces 619,367 metric tons of CO2e.

Refining the power resource further, the following is the result from 2018 eGRID data for the same amount of electricity:

"Using the eGRID subregion NWPP (WECC Northwest) emission rates and 4.80% percent line loss, your estimated annual use of 876,000,000 kWh of electricity results in 586,632,672 pounds CO₂, 367,219 pounds SO₂, and 550,829 pounds NO_x emitted in one year from the power plants in your area.

It would take 6,896,152 seedlings grown for 10 years or 313,053 acres of forests in one year to offset those CO₂ emissions."

<https://www.epa.gov/egrid/power-profiler#/NWPP>

Converting the above to metric tons, the CO₂ alone represents about 262,000 metric tons of GHG. Nitrous oxide has 298 time the global warming potential of CO₂.

<https://climatechangeconnection.org/emissions/co2-equivalents/>

Even the estimate of GHGs from purchased electrical power for on-site consumption in the high scenario is lowballed. Please redo the purchased power calculations and emissions to reflect reality.

Thank you,

Diane L. Dick
Longview

Cynthia Svensson

Dear Mr. Rich Doenges,

Here are my comments about the DSSEIS:

1. As a resident of Kalama, the State of Washington, and the Pacific Northwest I do not find any reassurance in the meager mention of mitigation plans in the DSSEIS. The plans need to be spelled out in detail; what, where, when, how much, etc. Saying the Washington Department of Ecology will be part of the process really just throws the responsibility on the State of Washington, much the same as your Department having to redo the DSSEIS. Why are State employees working for NWIW for free? If we can't depend on the permit applicants to do straightforward reports, how can we trust them to run what would be the World's biggest methanol plant (using an untried on full scale process) safely? Please demand a real, detailed mitigation plan from the applicants and allow citizens to review that plan. Living in Kalama, I need to know that my quality of life and safety will not be degraded.

2. I know that this plant would be in Washington and that you work for the State of Washington. Still, there are people in Oregon living closer to the proposed plant than most citizens of Kalama. They need protection and they have not even been mentioned let alone considered in mitigation or safety plans. Do we need to drag the State of Oregon into the discussion? Let's just be good neighbors and insist that NWIW do the right thing by mitigating GHGs in Oregon, as well, and include that in the mitigation plan.

3. I don't believe I saw water mentioned as a GHG in the DSSEIS and yet it is a big player when localized in a giant plume over a relatively small area. Recent wildfires really brought air quality issues to the forefront with unhealthy to hazardous conditions in the area. Now imagine a plume helping to seal that in. Sadly, if our experience with the Tillamook Burn is any indicator, we can expect more wildfires in the next several years just because of fire-dried forests. Please, give some consideration to water as the GHG that it is.

4. Please recheck the mileage used for the pipeline distance from the fracking fields to Kalama. I don't believe it will be possible to put in pipe "as the crow flies." The actual distance may raise figures by 50%.

5. How many GHGs are released in the average pipeline explosion? How often do the explosions happen? How is that correlated to the age of the pipeline? We have had an explosion very near Kalama. There was a bad one in Bellingham not too long ago. How many GHGs were released? This estimate needs to be added in to the GHG volume, if it has not already been done.

6. The DSSEIS has spent a lot of time on market analysis and comparing different processes. Unfortunately, there is one key process for which we have no data. The ULE has been tried in a pilot plant but never on a large scale, and certainly not on a World Class scale. There is a reason that the Methanol Industry has not taken up the ULE process and I don't believe it is just about profit. It is simply too big a risk for too little gain. It may not be any cleaner at all if the electricity needed to run the process is from fossil fuel rather than hydro and if the use of hydro causes some other user

to have to turn to fossil then there may be no savings at all.

7. The DSSEIS proves that there will be huge amounts of GHGs produced in the State of Washington. No one can prove that producing those GHGs will result in the failure to produce an equal amount of GHGs elsewhere. In an expanding market, which the DSSEIS fully stands by, the Kalama GHGs will be added to the ever growing amount of GHGs on the planet. Someone who is making good money doing something is not going to stop that venture just because someone else starts to make the same product. As long as there is money to be made, the first guy will keep going. There is money to be made by using cheap coal as feed stock or fuel in China and that will continue no matter what we do here in the State of Washington.

8. The DSSEIS reports that at least some of the methanol will possibly be burned as fuel. Thank you for considering that. Of, course, all of it can be burned as fuel. Please use figures reflecting all of it as fuel because even if it goes for olefins, it will free up other methanol to be used as fuel.

9. I know the DSSEIS is about GHGs and I have focused on that, but please, don't forget the many other problems that this proposed methanol plant would create such as 7 times the ASIL for DPM generated by the tugs needed to control the Panamax tankers. We already have so much DPM in our air from !-5, the railroads, and ship traffic. Please, don't let anyone add to that and then seal the whole mess in under a vapor plume.

Thank you,

Cynthia Svensson
MS Chemical Oceanography, U. of W.
Kalama resident

Annemarie Dooley MD

My name is Anne-Marie Julie, and I'm a kidney doctor and a member of Washington Physicians for Social Responsibility. I'm speaking tonight because we face multiple crises. The first in March, when I treated COVID patients, many of whom died. Then in the last week, as I prescribed inhalers to patients unable to breathe from wildfire smoke, a deadly disease followed by life-threatening wildfire smoke; both a direct result of our climate crisis.

Yet, inexplicably, I'm having to explain why it's not a good idea to build a greenhouse gas-producing methanol refinery on the banks of the Columbia where I stood last summer with the local community in Kalama. This Refinery will be fed by fracked gas that is toxic from source to delivery. I assume no one listening has seen the effects of methanol exposure on people. I have. It includes blindness, vomiting, and unless I clean the blood of the dialysis machine, death. But somehow we're to believe that carbon-intense methanol refining here is clean because it reduces coal burning in China. It sounds like the same flimflammy that came from Volkswagen when they promoted low-emission diesel engines; it was all an illusion.

To be blunt, the corporation and the paid experts behind this methanol refinery are part of a system of indifference that does not care if refining methanol imposes a cost of methane leaks and air pollution on state residents. Cost including chronic ill health, increased medication use and days lost from work; costs that are never counted because they fall on small and lower-income communities; costs that far outweigh the benefits offered by a small offering of local jobs.

I'm asking the Department of Ecology not to allow this refinery. A facility that would increase greenhouse gas emissions and contribute to a future of Northwest skies; yellow with smoke. The Shoreline Permit for this project should be denied. Thank you.

Sharon Rickman

>> My name is Sharon Rickman, and I live in Vancouver, Washington. Building a new fossil fuel infrastructure refining fracked gas is wrong and will negatively impact all of us and future generations. I lived in Western Pennsylvania and witnessed firsthand the harms of fracking to air and water quality. The oil and gas industry built fracking wells on our local small farms, targeting a vulnerable community with false promises. When the farmers' entire ecosystem was poisoned from hundreds of trucks hauling in water and hauling out toxic wastewater and open-air evaporation ponds, the oil and gas industry responded by proof to us that the air and water was not contaminated before we came here.

This EIS statement is misleading and does not address cumulative upstream impacts of all phases of fracking; including emissions of hundreds of trucks bringing in water, trucking out toxic wastewater, operation of compressor stations, and storing poisonous water in open-air evaporation ponds. The health from this toxic fracking chemicals is hazardous to people, air, animals, and land. We need new sustainable clean energy jobs in Washington. Building a new fossil fuel infrastructure using fracked gas will not provide that.

Please do the right thing and reject this proposal and all permits to stop this dangerous project.

George Raiter

>> Thank you for the opportunity to testify. My name is George Raiter. I'm a 45-year resident of Cowlitz County. I've served eight years on the Longview City Council, two terms as the Mayor of Longview in the state legislature, and for 12 years as a Cowlitz County Commissioner. I've contracted with Northwest Innovation for community outreach for the past three years.

I'm well aware that the social and spiritual health of our community is directly tied to the health of our economy. The approval of this project will both benefit our community and improve the global environment. I believe in some fundamentals; including equal application of the law and the rule of science. The studies you have are mandated by state law and indisputably based on sound science. By granting this permit, Washington can set the highest standard and be a national leader.

The [inaudible] emission technology results in the air emissions being classified as a minor source; similar to a new gas station.

The investment in zero liquid discharge allows no discharge whatsoever into the Columbia River. There's no solid waste generated by the process. Although there will be no rail or truck traffic moving raw material or product, this project will pay millions of dollars annually to the Cowlitz County Road Fund. Global greenhouse gases will be reduced equivalent to twice that emitted annually by the entire City of Seattle. The company has agreed to go further and mitigate local greenhouse gases.

Please do not move the goalpost. Follow the science, follow the law, grant these permits.

Longview/Kelso Building Trades Construction Council

>> Good evening. For the record, my name is Mike Bridges. I'm the current President of Longview/Kelso Building Trades Construction Council, and a lifelong resident of Cowlitz County. For over six years, you have heard me and many other local leaders and residents promote the many benefits of this project, and applaud the environmental protections and extra mitigation that Northwest Innovation has agreed to do.

I want to go on record that the Building Trades is in support of making mitigation a requirement in the final permitting documents to further secure the positive environmental impacts that it will create. We trust that Ecology will provide the same level of quality oversight for mitigation that they have throughout this year in the permitting process.

Over the years, I've seen a lot of parallels between the work we do as union leaders and the work being done by some of the environmental

groups. You've heard me speak during these hearings while I might not agree with all of the tactics and antics I've seen from the opposition. I know it is a noble cause to fight for the future of our planet and the future of our children, but I think the time for fighting is over. The department of ecology has included everything in this study that those opposed here today have asked for. The project still proves out to be a net benefit for the global environment.

While some of the numbers and variables have changed, we cannot argue the results of the math and the science that have been done to get to where we are now. We have a SCIS that clearly illustrates a huge reduction in global greenhouse gases. I sincerely hope our friends on the opposition side will see the environmental wind that is right here in front of them, the wind that they helped to create. To my friends that still oppose this project, I would urge you to reconsider. There is no one silver bullet that will fix global warming. We must look at things that we can do right now.

To those who still oppose the project based on politics, well, ignoring six years of study and science, I would say your position is disingenuous, to say the least. In closing, I would like to thank the department of ecology for this process and their due diligence to bring this project to the point we are now. We have the ability to make real positive changes while setting a standard for the rest.

>> Michael, thank you so much for your comments. Anything additionally you need to let us know, I ask you to submit in writing

Althausen Rayan Abbarno Attorneys at Law

>> My name is Peter Abbarno. I'm a small business owner, Attorney, mayor pro tem in the city of Centralia in Lewis County. But most importantly, I'm a father of two young school-aged children. I'm in favor of the methanol facility because of the positive regional impacts it'll have on jobs and the economy for my family and many other families, and the impact it will have on helping flattened the global greenhouse gas emission curve. Good-paying and family-wage jobs shouldn't be the sole province of the future sound. Southwest Washington deserves greater work opportunities and this project will not only create construction jobs, but 200 plus permanent family-wage jobs.

I have no doubt that high schools and community colleges will be creating curriculum and programs that complement this type of facility who will need employees with trade vocational training, as well as education in the science and math mathematics. The methanol facility will be huge factor in reducing the unemployment rate in Southwest Washington, which has over nine percent in Cowlitz County, and over nine percent here in Lewis. In addition, ecologies and analysis predicts that the facility will reduce global greenhouse gas emissions by about six million tons. That is assuming a large amount of methanol would be used as fuel rather than the intended use without factoring in future technological improvements and additional mitigation factors.

This type of displacement is a positive step towards reducing greenhouse gases globally. Washingtonians want their kayaks, tents, cars, and computers so why not contribute it to contribute to their production here and produce it in a way that will reduce global GHG? The alternative is that those products will be produced solely in other countries without any emission regulations. Actually, this facility is contributing more to GHG emissions than acting on the facility, which would help reduce global GHG and create local jobs. Thank you.

Jamie Weingarten

Jamie Weingarten, I'm a Kalama County resident. I like to think that I was involved in the Sovereign Citizens Movement, really believe in President Trump, and everything he's doing to fight against China and the Chinese influence overseas. I never thought I'd say this, but the Kalama Patriot Militia is really into supporting what the work being done here by the Riverkeeper and the Sierra Club. We stand with you in your fight against the Chinese influence in our region. I just want to say that, as a supporter of our president and America, I really am excited and enthusiastic about how much support we're getting for the fight that we have by all these good people who are calling in, and talking about this.

I just really want to make that testimony heard, and that as true-blooded Americans and believers in this country, we're standing together with all these wonderful folks that are calling in from out of state. I don't typically agree with them, but I'm going to have to join up with them on that. I thank you and I hope that you do what is right, what you know is right, and what we don't know is right here. Thank you very much.

Bob Carroll

Bob Carroll. I'm a member of IBEW Local 48 in Southwest Washington. I'm a resident of Vancouver, Washington. I'm fully in support of this project, and I hope that you will okay the permits to get this project going. The mitigation that will be done in order to support lower emissions is a great thing. Since there'll be no water emissions or water discharge into the river, that's a good thing because I'm also a fisherman. The river and the port is designed for projects to be built on it, to provide products for our country, as well as other countries too.

This is American made product that will be used to make the plastics that we all use. I'd rather have them made with lower emissions and made out of coal. Thank you very much for the work you've been doing. I encourage you to permit this project and let's get it going. It will also provide a number of jobs, but not only that it's going to provide careers. Because there are going to be apprentices that work on this job that we'll go to having 35 or 40-year careers in the construction trades. Thank you very much. Have a good day, and please permit this project.

Washington State Labor Council

Larry Brown. I'm President of the Washington State Labor Council. I'm here in support of the Kalama Manufacturing and Maritime Export Facility. This facility will help reduce global greenhouse gases for products that will be produced elsewhere if we don't produce it here. We know that it'll help sequester carbon in the products that had built, eventually, and then save tons of greenhouse gases. We work on economic development across the state.

One of the problems that our state has is the uneven benefit of the economy, that [inaudible] project that is going to work well for our rural areas of the state, providing jobs, providing for economic activity, provide for local governments and schools. I appreciate you giving me the opportunity to testify tonight and urge your support. Thank you.

Aedan McCall

>> I would like to say I oppose the construction of the Kalama Methanol Refinery because the project's goal of converting frac gas to methanol in order to export as fuel or for plastic, doesn't serve the interest of people living in and around Kalama or the rest of Washington. The facility may offer high paying jobs to residents, but the costs are similarly high. The pollution will have adverse effects on the people living in the area of the refinery and degradation of its surrounding environment.

With the analysis that almost a million tons of methane would be released each year throughout the fracking and conversion process, air and water quality would worsen, exacerbating the existing issues that living near a freeway with coal and oil trains traveling through consistently has created. Based on this information, I ask that a refinery ought not be built. Thank you for your time.

David Radtke

>> My name's David Radtke. I'm a union member of IBEW Local 48. I'm a Journeyman Electrician. I'm a rural resident and I've lived in the greater Portland area my whole life. We were working on a lot of different projects, schools solar projects, wind, the hydroelectric dams in Oregon and Southwest Washington. I understand the need for renewable energy and a greener future. I think that this project is going to help reduce the global greenhouse gas emissions related to methanol, and the use of plastics. Northwest Innovation Works that agreed to implement the zero liquid discharge technology to keep the Columbia River protected. That's something that we all care a lot about.

This facility will meet and exceed requirements for clean operation. The state of Washington is going to create something like a thousand construction jobs over a three-year period, 200 full-time jobs, 500 indirect jobs in the local community, much-needed tax revenue, and it's going to be done in a responsible way. I think it's time to move this project forward and I'm hopeful it can be a model for the future of construction in this country. Thank you.

Sept Gernez

Hi, my name is Sept Gomez. I'm an organizer with the Sierra Club, and I'm representing our 3.8 million supporters across the country who are counting on you to deny this project. The Sierra Club's mission is to explore, enjoy, and protect the planet. This project would destroy the local environment while massively contributing to global warming, and as such, we're working to stop it.

I'd like to remind you of your mission statement. The Department of Ecology's mission is to protect, preserve, and enhance Washington's land, air, and water for current and future generations.

Approval of this project would be a counter to your mission. We've given you facts so you don't need facts from me. I'd love to share where I'm coming from personally on this.

I am a transgender non-binary person and many youths in the trans community are unhoused. While the Clean Air Agency has been telling everybody to stay inside with the wildfire smoke fueled by climate change, our youths are out there suffocating. Unhoused individuals cannot stay inside. During this pandemic, my sister has been pregnant. She's due in December. It's a strange time to be welcoming my niece into the world and I'm counting on you to fight for a future where these kids can survive.

Please deny this project. Thank you

No methanol plant in Kalama for China.

Oct 4, 2020

The Chinese used to say, " Hide your light and bide your time".
Now, it is "Strive for achievement"

Please don't give the permit to this project because it isn't in the best interest for the American people.

It's known that the Chinese are buying their way into controlling as much of the world as they can and have been doing so quickly and quietly.

Don't be so naive as to give them our PORT, OUR CLEAN AIR AND OUR WATERWAYS TO FACILITATE THEIR MILITARY AND GOVERNMENT,.
We have been complacent and have stood by like children watching a freighter pass by.
The methanol sent overseas can only be detrimental to our safety and peace of mind.

If the argument is for clean air: be aware that China has been building coal plants in rural areas as it pushes through their " belt and road " plans across Asia to Africa and eventually, to Spain. They advance their plans and do not tell us..

If the argument for jobs: we can use the methanol here for our own use and encourage development and industry just as well as the foreign developers By using it here we know what it will be used for and don't take the risk of having it used against us.

Be reminded: imperialist China thinks Australia is " chewing gum on its boot". It has conflicts around the world, with us the U.S., Canada, Taiwan, India, Britain and Argentina just to mention a few.

To transport Huge quantities of methanol in container ships up and down the Columbia River is a trespass on all who consider it a safe passageway. The idea that this Large methanol plant will be BUILT DIRECTLY ACROSS FROM THE TROJAN NUCLEAR DEPOT containing caskets of highly contaminated nuclear waste is unbelievable. One destabilizing explosion could be disastrous for the communities close by and for the whole river. AND United States of America and its people.

The long term implications of this proposed methanol plant is only for Chinese expansionism. PLEASE DENY IT.

Margaret J. Cemulini

Washington Dept. of Ecology

RECEIVED

OCT 08 2020

WA State Department
of Ecology (CWN0)

John Flynn

The mission statement of the Washington Department of Ecology is to "protect, preserve and enhance Washington's environment for current and future generations." It is the responsibility of the Department of Ecology to protect the residents of the state from harmful health and environmental impacts.

The proposal by Northwest Innovation Works to build a fracked gas to methanol refinery on the shore of the Columbia River for shipment to China is in direct juxtaposition to that responsibility. Even the Governor of Washington, Jay Inslee, who was originally a supporter of the project, has come to the realization that this proposed fossil fuel project is not supportable.

I encourage the Department of Ecology to follow the governors lead and deny any and all permits for this unsustainable project.

Thank you.

John Flynn

RE: Comments Regarding the Draft Second Supplemental Environmental Impact Statement for the Northwest Innovations Methanol Manufacturing and Marine Export Facility Revised Mitigation

To Mr. Doenges, SEPA Responsible Official

The Cowlitz Indian Tribe has reviewed the revised Port of Kalama Draft Second Supplemental Environmental Impact Statement (Draft SSEIS) Greenhouse Gas Report associated with the Northwest Innovations methanol manufacturing and marine export facility. We thank the Washington State Department of Ecology for the one-week comment period extension which allowed our tribal council to discuss this important matter.

The Cowlitz Indian Tribe is a Federally Acknowledged Government entity located in the Pacific Northwest. Our historic area of interest includes a large portion of the Lower Columbia River Basin that spans both sides of the Columbia River in Washington and Oregon States. The proposed Kalama Methanol Manufacturing and Marine Export facility (also identified as the 'methanol facility') lies within our homeland, which has been established through historical adjudication processes. The Cowlitz Tribe has held neutrality on the project to evaluate company statements and actions. However, the Cowlitz Tribal Council has now determined this project is inconsistent with the Tribe's stewardship ethic and we today voice our opposition to this project moving forward.

The Cowlitz Indian Tribe does not evaluate project impacts based only on narrow regulatory definitions. Project impacts are, in reality and in fact, permanent impacts to a landscape. Within the Columbia River, features such as floodplains, wetlands, aquatic habitat, and Cultural Sites are in a depressed state. Landscape features, such as dredge spoils at the project site, are temporary, manmade features. Development is a habitat restoration opportunity that is lost – once a site is developed, the site cannot and will not be restored within the Cowlitz's seven-generations world view. The landscape of the Project's proposed APE and surroundings are rich with Cowlitz Heritage and significant Cultural and Natural Resources.

The Cowlitz Indian Tribe Culture Resources Department and Natural Resources Department work together to address important project-related impacts to natural resources which are integral parts of

our heritage and traditions. Clean water, culturally significant fish, plants, and the various species and habitats that will be affected are parts of our continuing Cultural Heritage. These components of the landscape, which are interdependent on each other, are priorities for the Tribe. The Tribe holds Indigenous knowledge about surrounding Cultural Resources, i.e. archaeological sites, fishing stations, root gathering locations (and the like). Though the landscape has changed over the period since European contact, there are still important Cultural Resources that need to be protected.

The Cowlitz Indian Tribe are stewards of the land. As such, the Tribe and Northwest Innovation Works have engaged throughout the permitting process. NWIW has been respectful and conscious of the Tribal interests in land, sea, air, water, fisheries and wildlife. We have, we believe, influenced some environmentally sound changes to the project proposal. In the event Kalama Methanol Manufacturing and Marine Export Facility moves forward in permitting, it is our expectation to have an ongoing involvement in mitigation portfolio discussion and review.

Please contact our Natural Resources Department Director, Taylor Aalvik, Cultural Resources Department Director Nathan Reynolds or our Natural Resources Program Assistant, Tiffini Alexander for follow up communications and scheduling. Taylor or Nathan can be reached via email taylor.a@cowlitz.org, or NReynolds@cowlitz.org, and Tiffini can be reached at: 360-577-8140, or talexander@cowlitz.org.

Sincerely Yours,

Philip Harju
Chairman of the Cowlitz Indian Tribe

Re: Comments on the Draft Second Supplemental Environmental Impact Statement for Northwest Innovation Works' Kalama Methanol Refinery and Export Terminal.

Director Watson:

We are experiencing a climate emergency; the Washington Department of Ecology (Ecology) should act accordingly. Ecology must re-examine its conclusion that the world's largest fracked gas-to-methanol refinery would somehow benefit our climate. Northwest Innovation Works' (NWIW) proposal and climate rationalizations—which are essentially the same as previously rejected coal, crude oil, and LNG export schemes—have no place in Washington's “carbon-free future.”¹ Recognizing that new fossil fuel infrastructure is incompatible with climate progress, Governor Inslee publicly stated that he can no longer in good conscience support NWIW's proposal. Ecology's willingness to accept NWIW's speculative, self-serving, and defeatist climate rationalizations—especially after the company was caught misleading Ecology about the refinery's purpose—jeopardizes Governor Inslee's credibility and accomplishments as a climate leader.

¹ Governor Inslee (quoted in Columbia Basin Bulletin, *Federal Climate Report Suggests More Warm Years Such As 2015 Will Be A Reality For Columbia Basin* (November 30, 2018)).

I. The Kalama Methanol Refinery Has No Place in a Low-carbon Future.

The intensifying climate crisis cannot be resolved by speculative half-measures, like NWIW's proposal, that deepen our dependence on fossil fuels. Governor Inslee explained that locking in multidecadal fracked gas infrastructure projects is not sufficient to accomplish what's necessary for our climate.² Even experts sympathetic to the methanol and the fossil fuel industries admit that "[w]e have no room to build anything that emits CO₂ emissions."³ Governor Inslee understands that Washington has a "dwindling window for action" in which we must reduce emissions to half their *current* levels to avoid reaching an irreversible tipping point.⁴ In this context, NWIW's proposal to increase current emissions between **4.17 and 5.41 million metric tons a year**⁵ (in hopes of slowing the growth of hypothetical future emissions) is unconscionable. There is no margin to entertain NWIW's gamble; Governor Inslee knows that "we don't have the luxury of a 50-year transition phase."⁶ Accordingly, NWIW's proposal to cause 4 or 5 million metric tons of climate pollution every year is not part of the "carbon-free future"⁷ that Governor Inslee has charted for Washington.

II. The DSSEIS Assumes, Without Explanation, That NWIW's Methanol Would Be Used *Instead of* Other Sources of Methanol.

As it must, Ecology has abandoned the Supplemental Environmental Impact Statement's (SEIS) flawed economic rationalizations for why NWIW's methanol would be used instead of other methanol.⁸ The SEIS' displacement theory "was based on the assumption that the methanol produced by [NWIW] would displace an equal quantity of methanol derived from coal in China because it is more expensive to make methanol from coal."⁹ Columbia Riverkeeper and others

⁷ Governor Inslee (quoted in Columbia Basin Bulletin, *Federal Climate Report Suggests More Warm Years Such As 2015 Will Be A Reality For Columbia Basin* (November 30, 2018)).

⁸ DSSEIS, Appendix B, pp. 4, 17.

⁹ DSSEIS, p. 22.

explained why this assumption was unreliable and untethered from basic economic principles.¹⁰ Recognizing these flaws, Ecology informed Washington legislators that NWIW's assertions about displacement did "not appear to be supported from an economics or emissions standpoint."¹¹ Ecology also requested "an improved explanation of how the proposed project would displace (i.e., reduce) coal-to-methanol production in China."¹² Upon further scrutiny in this Draft Second Supplemental Environmental Impact Statement (DSSEIS), Ecology has discarded NWIW's rationale for the displacement theory.¹³ Accordingly, NWIW's central climate argument for building a massive fracked gas-to-methanol refinery in Washington is without merit or justification.

Yet instead of admitting that substitution is speculative and uncertain, the DSSEIS just assumes that substitution would occur.¹⁴ The DSSEIS blithely claims that (1) demand for methanol in China will increase in the future,¹⁵ and (2) NWIW would meet that new demand instead of other, dirtier forms of methanol.¹⁶ But Ecology's new iteration of the "displacement theory" does not provide a reason *why* Chinese methanol consumers would choose NWIW instead of other methanol sources. Assuming, rather than explaining, substitution is especially galling because Ecology repeatedly asked for a *better* explanation of why substitution would

¹⁰ See Columbia Riverkeeper *et al.*, *Comments on the Draft Supplemental Environmental Impact Statement for Northwest Innovation Works' Methanol Refinery and Export Terminal*, pp. 10–17 (December 27, 2018).

¹¹ Ecology, *Letter to State Legislators Re: SEPA Process for the Northwest Innovation Works Methanol Facility*, p. 5 (February 25, 2020).

¹² DSSEIS, p. 23; *see also* DSSEIS, Appendix B, p. 5 ("Ecology has directed that the intent of the second SEIS is to, 'quantify . . . how the methanol produced would affect other sources of methanol production'").

¹³ *See* DSSEIS, Appendix B, p. 17 (explaining that the DSSEIS' economic analysis "is based on entirely different reasoning than was used in the First SEIS.").

¹⁴ Rhetorically, assuming displacement allows Ecology skip ahead to a straw-man comparison between coal and natural gas as methanol feedstocks. Logically, however, Ecology's inability to propose a new mechanism for substitution should have terminated the exercise in greenwashing referred to as the "displacement theory."

¹⁵ DSSEIS, p. 50 ("methanol market is forecast to continue growing"); *see also* DSSEIS, Figure 3.5-8.

¹⁶ DSSEIS, p. 50 (asserting that "if KMMEF sells 3.6 MMT per year to China, then the emissions for 3.6 MMT of methanol produced under alternate cases would be replaced with the emissions from the KMMEF-produced methanol each year."); *see also* DSSEIS, Appendix B, p. iii (suggesting that "low-cost methanol from Kalama would replace other low-cost Chinese suppliers – those that would be more likely to expand with the growing market"); *see also* DSSEIS, Appendix B, pp. 17–18 (claiming that that "low-cost coal-based methanol will expand production in China as demand for methanol increases").

occur.¹⁷ The DSSEIS jettisons NWIW's flawed rationale for substitution but provides no alternate mechanism. Instead, Ecology just assumes that perfect one-to-one substitution—a central contention of NWIW's climate claims—would occur. The competing explanations offered in the DSSEIS and the SEIS indicate that the “displacement theory” is a pre-determined result desperately searching for justification, which is clearly arbitrary

Evidence in the DSSEIS actually contradicts Ecology's assumption about substitution. The DSSEIS contains information suggesting that Chinese methanol customers would have no incentive to purchase NWIW's methanol instead of other methanol—and, in fact, might prefer domestic methanol sources. First, the DSSEIS reiterates that all methanol is the same; NWIW's methanol is not superior to other methanol.¹⁸ Second, the DSSEIS concludes that NWIW would be a “price-taker,”¹⁹ meaning that NWIW would sell its methanol at the same price as other methanol producers.²⁰ Third, worldwide methanol production capacity significantly exceeds demand, and capacity is increasing faster than demand.²¹ If NWIW's methanol would be no better or cheaper than other methanol, and there will be no shortage of methanol producers to choose from, a methanol consumer in China would have no reason to select NWIW instead of a different methanol source. Add to that scenario the DSSEIS' admission that China prefers

¹⁷ Ecology, *Letter to State Legislators Re: SEPA Process for the Northwest Innovation Works Methanol Facility*, p. 2 (February 25, 2020) (“Ecology does not have enough information to determine if the SEIS's central assertion driving the net beneficial conclusion, displacement of Chinese coal-to-methanol plants, will occur. Ecology has questioned this assumption and asked for more information to be included in the analysis on which the assumption is based.”); *see also* DSSEIS, p. 23 (Ecology requested “an improved explanation of how the proposed project would displace (i.e., reduce) coal-to-methanol production in China.”); *see also* DSSEIS, Appendix B, p. 5 (“Ecology has directed that the intent of the second SEIS is to, ‘quantify . . . how the methanol produced would affect other sources of methanol production’”).

¹⁸ DSSEIS, p. 73 (“[U]nlike products that can be uniquely distinguished by their qualities, methanol is a uniform commodity.”); *see also* DSSEIS, Appendix B, p. 6 (“methanol is a commodity, in that the quality doesn't vary noticeably from one producer to the next”).

¹⁹ DSSEIS, p. 50; *see also* DSSEIS, Appendix B, p. iii (explaining that all future methanol from Kalama or other sources will be sold at the same, “market clearing price.”).

²⁰ If the DSSEIS is wrong about NWIW being a price-taker, and NWIW would actually sell its methanol for less than the prevailing market rate (as suggested at DSSEIS, p. 52), the increased availability of cheaper methanol could drive additional (rather than substitute) consumption. *See* Columbia Riverkeeper *et al.*, *Comments on the Draft Supplemental Environmental Impact Statement for Northwest Innovation Works' Methanol Refinery and Export Terminal*, p. 13 (December 27, 2018) (explaining the relationship between decreasing commodity prices and increased consumption).

²¹ DSSEIS, Appendix B, Figure 3-4.

domestic methanol production to imports when possible,²² and Ecology’s assumption that Chinese consumers would purchase methanol from NWIW instead of other sources becomes even more arbitrary and unsupported.

If NWIW can sell all of its identical methanol at identical prices to its competitors, that means that the methanol market is absorbing NWIW’s methanol *in addition to* other sources of methanol. In fact, the analysis in the DSSEIS finds no cause-and-effect connection between the Kalama proposal and reduced coal-to-methanol production in China. The market analysis essentially concludes that the methanol market is expanding so quickly that any new source of methanol will be price competitive.²³ If this is true—and it would almost have to be, in order for NWIW to find buyers based on the information in the previous paragraph—NWIW’s methanol, and its greenhouse gas emissions, would be additive. The DSSEIS, like the SEIS, has failed to address a fundamental problem with the displacement theory: namely, that increasing the supply of cheap methanol available to a rapidly expanding market is likely to result in additional, rather than substitute, consumption.²⁴

Ecology’s failure to explain *why* substitution would occur—even though so much of the climate analysis rest on this assumption—violates the State Environmental Policy Act (SEPA). When an agency “entirely fail[s] to consider an important aspect of the problem,” the resulting SEPA²⁵ analysis is illegal.²⁶ By merely assuming, rather than explaining, substitution, the DSSEIS “entirely failed to consider”²⁷ whether substitution would actually occur. And whether NWIW’s methanol would substitute for, or add to, consumption of other sources of methanol is an important aspect of the DSSEIS’ climate analysis.²⁸ Accordingly, Ecology’s failure to explain

²² DSSEIS, Appendix B, p. 18 (“within China there is likely a preference for expanding domestic [methanol] production where feasible”).

²³ DSSEIS, Appendix B, p. 19.

²⁸ See Ecology, *Letter to State Legislators Re: SEPA Process for the Northwest Innovation Works Methanol Facility*, p. 2 (February 25, 2020) (“Ecology does not have enough information to determine if the SEIS’s central assertion driving the net beneficial conclusion, displacement of Chinese coal-to-methanol plants, will occur.”); see also Ecology, *Comments on Draft Supplemental Environmental Impact Statement*, p. 6 (December 8, 2018) (“One of the central

an important aspect of NWIW's displacement theory—namely, why displacement would occur—violates SEPA.

III. The DSSEIS' Assumptions About the Future are Defeatist, Almost Certainly Incorrect, and Illegal.

Even if Ecology could explain why substitution would occur under *current* market conditions (which it cannot), the DSSEIS' prediction that the fundamentals of methanol production and consumption will remain the same for the next 40 years is defeatist and unreliable. As the United States Court of Appeals for the D.C. Circuit noted, “projections of energy markets over a 25-year period are highly uncertain and subject to many events that *cannot be foreseen*, such as supply disruptions, policy changes, and technological breakthroughs.”²⁹ Undeterred, the DSSEIS attempts to predict the future—and its prediction is bleak: no economic events, environmental regulations, or technological breakthroughs will materially alter the way methanol is consumed or produced during the next 40 years.³⁰ Continuing down our current trajectory of rampant fossil fuel consumption would be disastrous for our planet and civilization. NWIW shrugs and says: this “how the world actually works.”³¹ Fortunately, the DSSEIS' fatalistic assumptions about the future are not reliable.

The DSSEIS' cynical guess about the next 40 years of human history does not constitute the “hard look” that SEPA requires. SEPA mandates a hard look at the impacts of a proposal that are reasonably foreseeable—no less, and no more. An agency “cannot close its eyes” to a project's negative impacts;³² by the same token, an agency cannot impute to a proposal benefits that are not reasonably foreseeable.³³ Because, as explained below, Ecology's predictions about the future of China's methanol market are unreliable, NWIW's supposed climate benefits premised on those predictions are also unreliable. The DSSEIS' attribution of speculative and uncertain benefits to NWIW's proposal violates the requirement that Ecology take a “hard look”

points of the Draft SEIS is that the emissions displaced by this project are greater than the emissions created by the project . . .”).

³² *Cheney v. City of Mountlake Terrace*, 87 Wn.2d 338, 344 (1976).

³³ Cf. Ecology, *Comments on Draft Supplemental Environmental Impact Statement*, p. 6 (December 8, 2018) (asking NWIW to “use expected and worst case assumptions, not just best case assumptions, to support an analysis that is as accurate and inclusive as possible”).

at NWIW's impacts on the environment and human health.³⁴ The current displacement theory is as speculative and selective as the first; Ecology should not rely on displacement when calculating the emissions from NWIW's proposal.

a. Demand for methanol may fluctuate or decrease over the next 40 years.

The DSSEIS' assumption that demand for methanol will increase in line with current³⁵ projections throughout the next 40 years³⁶ is speculative and unreliable. In reality, whether demand for methanol grows, shrinks, or stays the same over the next 40 years will be determined by a wide range of factors that "cannot be foreseen"³⁷ or controlled by Ecology. Chief among those unknowable factors is the future of the global and Chinese economies; without robust global economic growth, the projected growth in demand for methanol will not materialize. Recent unforeseen economic disruptions—including the Great Recession, the COVID19 global pandemic, and natural disasters intensified by the climate crisis—demonstrate our inability to predict reliably future economic conditions.

Demand may also decrease or stagnate if substitutes; technological innovations; or trade, environmental, or other policies emerge that discourage methanol or plastics consumption. Specifically, industry watchers are beginning to question the assumption of ever-increasing demand from the plastics sector in China and worldwide. The Center for International Environmental Law recently explained that "the proliferation of social and political changes . . . call into question industry assumptions of unfettered growth in plastic demand and consumption."³⁸ For instance, Chinese policies to reduce single-use plastics will significantly erode demand for plastic feedstocks.³⁹ Other analysts have noted that "Plastics, like oil and gas, are suffering from the dual malady of overexpansion and *underconsumption*."⁴⁰ Additionally, the

³⁴ See *Pub. Util. Dist. No. 1 of Clark Cnty. v. Pollution Control Hearings Bd.*, 137 Wash. App. 150, 158 (2007); see also *Coalition for a Sustainable 520 v. U.S. Department of Transportation*, 881 F. Supp. 2d 1243, 1259 (W.D. Wash. 2012) (holding implicitly that NEPA's "hard look" standard applies to SEPA).

³⁵ Or, more accurately, pre-COVID19 projections.

³⁶ DSSEIS, Figure 3.5-8.

³⁷ See *Sierra Club v. United States DOE*, 867 F.3d 189, 194 (D.C. Cir. 2017) (describing the difficulty in predicting fossil fuel and energy markets over a 25-year period).

³⁸ Exhibit 1: Center for International Environmental Law, *The Long-Term Prospects for the Plastics Boom*, pp. 2–3 (April 2018).

³⁹ Exhibit 2: Independent Commodity Intelligence Services, *INSIGHT: China ban on single use plastics threatens 4m tonnes/year of polymer demand* (January 24, 2020).

⁴⁰ Exhibit 3: Vox, *Coronavirus stimulus money will be wasted on fossil fuels* (June 29, 2020) (emphasis added).

DSSEIS acknowledges that demand from traditional methanol customers is already weakening.⁴¹ Flagging demand from traditional methanol consumers “due to environmental protection policies and weak prices”⁴² corroborates existing concerns that 40 years of steady demand growth from fuel and olefins producers is not a foregone or reliable conclusion. NWIW’s alleged climate benefits come from supplying marginally cleaner methanol to meet projected future increases in methanol demand.⁴³ Because those demand increases are not foreseeable throughout the life of the proposal, neither are NWIW’s climate benefits.

b. Climate policy will change significantly in the next 40 years.

Ecology’s assumption that China, the State of Washington, and the rest of the world will not adopt new policies⁴⁴ to address the climate crisis during the next 40 years is contrary to the evidence and, frankly, disheartening. The DSSEIS’ market analysis is expressly premised on no new climate regulation occurring in the next 40 years.⁴⁵ Undercutting this key premise, however, the DSSEIS describes current efforts to improve climate policy⁴⁶ and admits that new environmental regulations could significantly affect decisions about methanol production and

⁴¹ DSSEIS, Appendix B, p. 8 (“The traditional downstream sectors are seeing a slowdown in methanol demand. For example, formaldehyde and DME capacity barely expanded in 2019 primarily due to environmental protection policies and weak prices.”).

⁴² *Id.*

⁴³ DSSEIS, Appendix B, p. iii (suggesting that “low-cost methanol from Kalama would replace other low-cost Chinese suppliers – those that would be more likely to expand with the growing market”).

⁴⁴ In addition to climate policy, the DSSEIS also assumes that trade policies will not change in next 40 years—while acknowledging that trade policy has a significant impact on methanol prices and the fundamentals of the market analysis. *See* DSSEIS, Appendix B, p. 15 (international trade in methanol is “subject to ongoing trade relationships with many different countries”); *see also* DSSEIS, Appendix B, p. 1 (explaining that “trade policies” play a role in methanol consumption and production decisions). As Columbia Riverkeeper and others previously explained, the current U.S.-China trade tensions are just one example of how changes in trade policy could upend the DSSEIS’ assumptions. *See* Columbia Riverkeeper *et al.*, *Comments on the Draft Supplemental Environmental Impact Statement for Northwest Innovation Works’ Methanol Refinery and Export Terminal*, pp. 11–12 (December 27, 2018).

⁴⁵ DSSEIS, p. 49 (excluding potential “different global policies (fossil fuel/plastics phase outs or bans for example)” from the analysis); DSSEIS, p. 105 (The DSSEIS does not “consider the possibility of new policies or market shifts to occur in the markets for fossil fuels or plastics. For example, a ban or phase-out of those products could have results that would alter the assessed impacts of the KMMEF.”); *but see* Exhibit 2 (describing China’s new ban on some single-use plastics) *and* Exhibit 1 (describing the proliferation of plastic bag bans worldwide).

⁴⁶ DSSEIS, pp. 33–37.

consumption.⁴⁷ Difficulty in precisely predicting future climate policy choices⁴⁸ does not justify or excuse the DSSEIS' assumption that global climate policy will remain the same for the next 40 years. Instead of making obviously false and defeatist assumptions, Ecology should admit that climate regulations may change significantly and that such changes make NWIW's impact on future global emissions tenuous and unpredictable.

China's recent pledge to achieve carbon neutrality by 2060 obliterates one of the DSSEIS' key assumptions. The DSSEIS' market analysis is premised, in part, on China not adopting more progressive climate policy before 2060.⁴⁹ But on September 22, 2020, President Xi announced to the U.N. General Assembly an ambitious plan for China to achieve carbon neutrality in the next 40 years.⁵⁰ This announcement casts many of NWIW's key claims,⁵¹ and the assumptions in the market analysis, into serious doubt. While the details of China's pledge are still emerging, and there is no absolute guarantee that China will meet its goal, President Xi's statement makes new climate policy in China substantially more foreseeable than not. Ecology should not give NWIW credit for China's progressive climate policy.

Similarly, the market analysis' assumption that climate policy will not progress in the next 40 years ignores state and international goals for combating climate change. Many nations remain committed to the Paris Accord, which calls for limiting global warming to well below 2 °C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5 °C above pre-industrial levels. Reducing emissions consistent with limiting warming to 1.5 °C is also the policy of the State of Washington. To reach these goals, global greenhouse gas emissions from fossil fuel combustion and industry will need to decline by more than 75%, which is roughly the reduction codified into Washington law this year. The market analysis does not explain how these climate policies would impact NWIW or NWIW's ability to displace other forms of methanol.

⁴⁷ DSSEIS, p. 105 (explaining that new policies leading to "a ban or phase-out of" fossil fuels or plastics "could have results that would alter the assessed impacts of the KMMEF"); DSSEIS, Appendix B, p. 14 (the "production of methanol, MTO and coal-to-olefin (CTO) development in China are potentially affected by environmental regulations"); *see also* DSSEIS, p. 68 (admitting that evolving "environmental policy in China and globally" complicates the market forecast).

⁴⁸ *See* DSSEIS, p. 49 ("Scenarios with substantially different global policies (fossil fuel/plastics phase outs or bans for example) are too uncertain to include in this analysis."); *but see* Exhibit 2 (describing China's new ban on some single-use plastics) *and* Exhibit 1 (describing the proliferation of plastic bag bans worldwide).

⁴⁹ *Id.*

⁵⁰ The Guardian, [China pledges to become carbon neutral before 2060](#) (September 22, 2020).

⁵¹ Because NWIW's methanol—and its end uses, fuel and olefins—are not even close to carbon neutral, it is uncertain whether methanol consumers in China would be able to purchase or use NWIW's product throughout the next 40 years.

c. New technologies could alter the methanol market and the displacement analysis.

The DSSEIS's assumption that no technological progress would impact methanol production or consumption over the next 40 years is arbitrary and contrary to NWIW's own predictions. Methanol production and consumption have experienced "a host of evolving technologies" in recent decades;⁵² such innovation will not stop if NWIW begins producing methanol. New production technologies—and technological development of substitutes for methanol or its end uses—may significantly alter the methanol market or cause NWIW to "displace" less-carbon-intensive sources of methanol. Nevertheless, the DSSEIS' market analysis pretends that no new technological developments or substitutes will emerge over the next 40 years to disturb the current market dynamic.⁵³ Ecology admits this assumption is wrong,⁵⁴ but then relies on this assumption claiming that the inevitable technological changes are difficult to predict.⁵⁵ Not knowing what will happen next is not the same as knowing that nothing will happen. Instead of making bad assumptions, the final SSEIS should admit that next 40 years of technological developments—and their effects on the production and consumption of methanol—are not foreseeable.

NWIW might displace emerging technologies that are better for our climate. The DSSEIS' faulty assumption that no new technological alternatives will emerge in the next 40 years sets up a one-sided comparison between NWIW and existing, dirtier forms of methanol production.⁵⁶ But as new production technologies and substitutes develop over the next 40 years, NWIW could wind up "displacing"⁵⁷ cleaner sources of methanol, olefins, or transportation. For example, NWIW predicts that a nearly carbon-neutral source of methanol—from electrolysis driven by solar power⁵⁸—will become available in the Chinese market during the lifetime of

⁵² Cf. DSSEIS, p. 51 ("Key drivers of increasing demand are . . . a host of evolving technologies for using methanol for fuel transportation and cooking fuels"). For instance, 40 years ago, no one used the "ULE" process—or any process—to make methanol for plastics or transportation fuel on a commercial scale.

⁵³ DSSEIS, p. 75 (explaining that the DSSEIS' market analysis "assumes that methanol production technologies are not materially improved in the future").

⁵⁴ DSSEIS, p. 75 ("In reality, methanol technology is likely to change and improve.").

⁵⁵ DSSEIS, p. 75.

⁵⁶ SEPA requires consideration of a reasonable range of alternatives and choices, as opposed to the kind of constrained choices that lead to only one conclusion. *Solid Waste Alternative Proponents v. Okanogan Cty.*, 66 Wn.App. 439, 444–45 (1996).

⁵⁷ This assumes the DSSEIS explains *why* displacement would occur—it does not.

⁵⁸ See, e.g., Uusitalo *et al.*, *Potential for greenhouse gas emission reductions using surplus electricity in hydrogen, methane and methanol production via electrolysis*, Energy Conversion and Management, Vol. 134, pp. 125–34 (February 2018).

NWIW's proposal, and perhaps even before NWIW would begin production.⁵⁹ Additionally, many climate experts tout vehicle electrification as a necessary step towards a truly low-carbon future, but an abundance of cheap fossil fuels (like NWIW's methanol) could disrupt the adoption of electric vehicle technology. The DSSEIS' conclusion that any "displaced" methanol would be dirtier than NWIW's methanol rests on assumption that no cleaner methanol or substitutes will attempt to enter the market in the next 40 years. Even NWIW predicts otherwise.⁶⁰

d. A market analysis cannot reliably predict methanol consumption in China's planned economy.

The DSSEIS' market analysis is unreliable because market forces only partially determine how methanol is produced and consumed in China.⁶¹ The Chinese economy is still a planned economy in many respects, subject to substantial government control over how, where, and when to produce and consume certain commodities.⁶² The DSSEIS acknowledges that, while China has begun moving toward a mixture of market and planned economy, this transition will take a long and uncertain amount of time.⁶³ Nevertheless, the analysis proceeds under the false premise that only market principles determine methanol production and consumption decisions in China. In blindly applying a pure market analysis to a planned economy, Ecology "entirely failed to consider an important aspect of the problem"⁶⁴ and generated a DSSEIS that is unreliable and illegal.

Below are a few examples illustrating how non-market forces could significantly alter methanol production or consumption in China, undermining the market analysis on which the DSSEIS' conclusions rest:

⁵⁹ See Northwest Innovation Works, *Investment Overview*, pp. 20, 22 (March 2018) (suggesting a new source of renewable methanol could be available before 2025 and at latest 2040); *see also*, generally, Choon *et al.*, *Powering the Future with Liquid Sunshine*, 2 Joule 10 (2018).

⁶⁰ Northwest Innovation Works, *Investment Overview*, pp. 20, 22 (March 2018).

⁶¹ DSSEIS, p. 73 ("It is difficult to know how far [China] has progressed toward a free market economy, and how much it retains the planned, or control economy where the government makes the decisions about what is produced where. China has been transitioning toward a mixed economy where market forces play a role in determining supplies."); *see also*, e.g., DSSEIS, Appendix B, p. 18 ("within China there is likely a preference for expanding domestic production where feasible").

⁶² *See*, e.g., DSEIS, Appendix A, p. 59 (describing China's strict regulation of natural gas consumption by economic sector).

⁶³ DSSEIS, Appendix B, p. 16 ("China does not currently operate a completely free market," and China's current perceived movement toward a free market "is an enormous transition and will take a long time to accomplish.").

⁶⁴ *Lands Council v. McNair*, 537 F.3d 981, 987 (9th Cir. 2008).

- China's government could simply forbid the use, or cap the increase, of coal as a feedstock for methanol. This is not farfetched; China's government has already forbidden new domestic natural gas as a methanol feedstock.⁶⁵ China recognizes the problematic nature of its coal-to-methanol industry and is actively taking steps to reduce coal-to-methanol production and its GHG footprint.⁶⁶ Indeed, China will almost have to prohibit or curtail coal-to-methanol in order to achieve China's recently announce goal of carbon neutrality.
- Alternatively, China's government could mandate the continued, or increased, production and consumption of coal-based methanol. Commentators have noted that the growth of China's coal-to-methanol industry appears to be driven at least in part by domestic "labor policy" and "social incentives," including China's government's desire to "foster downstream plastic processing as well as upstream coal mining employment in China's poorer interior regions."⁶⁷
- Many of NWIW's international competitors also do not operate in free markets. The price of naphtha, a key substitute for methanol, is tied to crude oil production.⁶⁸ Crude oil production and price is significantly influenced by the Organization of Petroleum Exporting Countries (OPEC), which can artificially move oil prices through controls on output. OPEC has historically used its partial monopoly on oil production to advance the geopolitical, as well as economic, goals of its member states. Future OPEC decisions to increase, reduce, or maintain crude oil production are not foreseeable but could make naphtha cheaper or more expensive than current market forces would dictate.

Despite these possibilities, the DSSEIS claims that its pure market analysis reliably predicts how China's largely planned economy would respond to increased methanol supply from NWIW. In reality, the scenarios above demonstrate that China could decide to produce and consume more *or* less coal-derived methanol than market conditions dictate.

⁶⁵ See DSSEIS, Appendix B, p. 15.

⁶⁶ DSEIS, Appendix A, pp. 59–60.

⁶⁷ Center for International Environmental Law, *Fueling Plastics: How Fracked Gas, Cheap Oil, and Unburnable Coal are Driving the Plastics Boom*, p. 6 (2017); see also DSSEIS, Appendix B, p. 17 (admitting that China's decisions about whether to curtail or increase coal-to-olefin production may depend in part on "government policies related to local employment.").

⁶⁸ See DSSEIS, p. 70 ("[T]he profitability and economic feasibility of naphtha-to-olefins over MTO is highly dependent on oil prices since naphtha is derived from oil.").

Myopically examining only market forces is even more arbitrary because the Kalama methanol refinery would be owned and financed by the Chinese and American governments, respectively. As Columbia Riverkeeper has explained elsewhere in detail, the Chinese government, through the Chinese Academy of Sciences, controls Northwest Innovation Works.⁶⁹ Additionally, the U.S. Department of Energy is contemplating a \$2 billion investment in the construction cost of the Kalama methanol refinery.⁷⁰ State control and subsidy of companies like NWIW is the antithesis of a free market and strongly suggests that factors other than pure market forces could influence how NWIW makes and sells methanol.

IV. If NWIW's Defeatist Assumptions Are True, Displacement Is Temporary and All Methanol Consumption Is Additive in the Long Term.

If all of the DSSEIS' assumptions discussed in Sections II and III are correct, all of NWIW's lifecycle emissions would *still* be additive to emissions from Chinese coal-based methanol in the long run. The DSSEIS assumes that: demand for methanol in China will continue to grow;⁷¹ all new demand will be met;⁷² and the demand will be met either by NWIW or a dirtier source of methanol.⁷³ What the DSSEIS should have explained is: what happens after NWIW stops operating or all of its available fracked gas feedstock is turned into methanol and used as olefins or fuel in China? By the DSSEIS' logic, China's demand for methanol would still be increasing, that demand will be met, and China (without NWIW) will resume using dirtier fossil fuel resources and pathways to meet that demand. The DSSEIS' assumptions only suggest that China would use NWIW's methanol first or before—not instead of—using other, dirtier sources of methanol.

Because NWIW's carbon dioxide pollution would remain in the atmosphere for 300 to 1000 years,⁷⁴ NWIW's purported ability to displace dirtier forms of methanol is relatively meaningless if that displacement is not permanent. Ecology must consider impacts that would

⁶⁹ See Exhibit 4: Columbia Riverkeeper, *Letter to the Committee on Foreign Investment in the United States regarding potential foreign governmental control of Northwest Innovation Works*, p. 2 (April 18, 2019).

⁷⁰ See Exhibit 5: Desmog, *Washington Petrochemical Plant Subsidies Would Violate Federal 'Double Dipping' Rules Say Environmental Groups* (October 4, 2019).

⁷¹ DSSEIS, Figure 3.5-8.

⁷² DSSEIS, pp. 51 ("all methanol demand will be met"), 75, 79.

⁷³ DSEIS, Appendix A, p. 58 ("[I]n the absence of attractive imported methanol, coal based domestic methanol production will continue to rise to meet growing industry needs based both in economic and market forces as well as policy direction.").

⁷⁴ NASA, *The Atmosphere: Getting a Handle on Carbon Dioxide* (October 9, 2019).

occur after the lifetime of a proposal where, as here, it makes sense to do so.⁷⁵ The long-term accumulation of carbon pollution in our atmosphere—not the rate of carbon emissions during any given year—is driving the climate crisis. According to the DSSEIS’ logic, the only way to prevent China from consuming NWIW’s methanol *and then other sources of methanol* is to prevent NWIW from exporting North American fracked gas as methanol to China. This aligns with the need, becoming more widely recognized, to leave a significant portion of the earth’s remaining fossil carbon in the ground.⁷⁶

NWIW will doubtless argue that China’s production and consumption of methanol (and potential substitutes) after the lifetime of NWIW’s proposal are too difficult to predict.⁷⁷ But it would be completely arbitrary for Ecology to employ one set of market assumptions during the proposal’s lifetime but abandon those assumptions the instant NWIW exits the methanol market. NWIW cannot have it both ways. Either the market analysis’s assumptions are too speculative (in which case the displacement theory should be removed from the SSEIS) or those assumptions are reliable (in which case displacement would not occur in the long run). Under either analytical approach, the climate pollution caused by NWIW’s proposal would add to—not displace—pollution from other types of methanol production.

V. The Kalama Methanol Refinery’s Climate Pollution Would have Significant Negative Environmental Impacts.

For almost five years, NWIW, the Port of Kalama, and Cowlitz County have twisted themselves in knots to avoid an obvious conclusion: the Kalama methanol refinery’s climate pollution would have “significant adverse impacts” within the meaning of SEPA.⁷⁸ For all of its flaws, the DSSEIS does admit that the methanol refinery’s climate pollution would be “significant.”⁷⁹ Ecology could hardly have found otherwise;⁸⁰ the DSSEIS estimated greenhouse

⁷⁵ See WAC 197-11-060(4)(c) (Agencies must “carefully consider the range of probable impacts . . . that are likely to arise or exist over the lifetime of a proposal or, depending on the particular proposal, longer.”).

⁷⁶ See Scientific American, *The Biggest Climate Challenge: Leaving Carbon in the Ground* (November 30, 2015).

⁷⁷ How such conditions could be reliably predictable for 40, but not 41, years is difficult to understand.

⁷⁸ RCW 43.21C.060.

⁷⁹ DSSEIS, p. 105.

⁸⁰ See *City of Federal Way v. Town & Country Real Estate, LLC*, 161 Wn. App. 17, 55, 252 P.3d 382, 401 (2011) (rejecting argument that contributions of 0.05 percent and 0.12 percent to Washington’s total carbon emissions would be insignificant for SEPA purposes).

gas emissions from NWIW's proposal at between 4.17 and 5.41 million metric tons a year.⁸¹ By any measure, that is an extraordinary amount of climate pollution and clearly significant.

Like much of the DSSEIS, however, Ecology's reasons for finding significance are internally inconsistent and violate SEPA. The DSSEIS specifically concludes that the "in state" emissions attributable to NWIW are significant, requiring mitigation.⁸² SEPA contains no authority for constraining the "significance" question to in-state impacts—all reasonably foreseeable impacts are part of the significance inquiry and, where applicable, the mitigation requirement.⁸³ Further, Ecology's conclusion that the methanol refinery's impacts would be "significant" implicitly rejects the displacement theory. But it is arbitrary to rely on displacement in one section of the DSSEIS and ignore it in another. Ecology appears to be searching for a way to make mitigation enforceable, but only within the scope of NWIW's pre-existing voluntary in-state mitigation proposal. Whatever its motivations, Ecology cannot legally limit the significance inquiry to in-state effects and cannot logically find that the proposal's impacts are "significant" while adopting NWIW's displacement theory.

VI. NWIW's Proposed Mitigation Framework is Incomplete and Illegal.

The mitigation framework illegally ignores a large portion of the greenhouse gas emissions attributable to NWIW. The Shoreline Management Act requires mitigation to ensure "no net loss" of shoreline ecological functions from development proposals.⁸⁴ Like all proposed shoreline developments, the methanol refinery must mitigate its negative impacts—including climate impacts—on Washington's shorelines.⁸⁵ Setting aside the unreliable displacement theory (which Ecology's significance determination implicitly rejects), *all* of NWIW 4.17 to 5.41 million metric tons per year of climate pollution would harm the ecological function of

⁸¹ DSSEIS, p. 84 (Table 3.5-13).

⁸² DSSEIS, p. 105.

⁸³ WAC 197-11-060(4)(b) (SEPA regulations specifically direct that an "agency shall not limit its consideration of a proposal's impacts only to those aspects within its jurisdiction, including local or state boundaries."); *see also Cathcart-Maltby-Clearview Comm. Council v. Snohomish Cty.*, 96 Wn.2d 201, 209 (1981) (SEPA "mandates that extra-jurisdictional effects be addressed and mitigated, when possible.").

⁸⁴ Ecology, *Shoreline Master Program Handbook*, Chapter 4, p. 3 (2010) ("Simply stated, the no net loss standard is designed to halt the introduction of new impacts to shoreline ecological functions resulting from new development.").

⁸⁵ *See Columbia Riverkeeper et al. v. Cowlitz County et al.*, Washington Shorelines Hearings Board Case No. 17.010c, *Ecology's Motion for Partial Summary Judgement*, p. 13 (August 7, 2017) (explaining "the clear connection between greenhouse gas emissions, climate change, and the high potential for impacts to the shorelines of statewide significance and the Lower Columbia estuary specifically.").

Washington’s shorelines. The “no net loss” mitigation requirement therefore applies to *all* reasonably foreseeable greenhouse gas emissions caused by the methanol refinery. Absent such mitigation, approving the Conditional Use Permit (CUP) would violate the Shorelines Management Act.

Regarding the subset of the proposal’s greenhouse gas pollution that NWIW proposes mitigating, the DSSEIS—like the SEIS before it—provides no meaningful detail about that mitigation. SEPA guidance requires NWIW to “clearly identify the mitigation measures” NWIW is proposing and describe whether those measures are mandatory or potential.⁸⁶ Ecology has reiterated the need for greenhouse gas mitigation measures that are real, specific, identifiable, quantifiable, verifiable, and permanent.⁸⁷ Precisely these concerns led Ecology to reject NWIW’s nearly identical mitigation framework in the SEIS and to call for “additional discussion” of the proposed mitigation in the SSEIS.⁸⁸ Specifically, Ecology requested more complete information on seven aspects of NWIW’s mitigation proposal.⁸⁹ NWIW failed to respond to these outstanding questions.⁹⁰ Ecology then informed Washington legislators that an SSEIS was needed to develop “detailed emissions accounting to know how much mitigation must occur, criteria to make sure the [mitigation] projects and markets used to comply generate real, verifiable, and permanent reductions, and procedural requirements to make sure [mitigation] happens as intended.”⁹¹ Instead of providing specific information responsive to Ecology’s questions about mitigation, NWIW keeps talking about creating a framework, partnering with stakeholders, and enlisting the help of an advisory board.⁹² The DSSEIS provides no new details on how NWIW’s framework would translate into real, verifiable reductions in global greenhouse gas levels. Without information about the specific carbon offset projects that NWIW would fund, Ecology has no real ability to assess the efficacy of potential future mitigation. Ecology cannot

⁸⁶ Ecology, *Publication No. # 98-114: State Environmental Policy Act Handbook*, p. 57 (2003).

⁸⁷ Ecology, *Comment to PSCAA on DSEIS for PSE LNG Project*, p. 2 (Nov. 21, 2018).

⁸⁸ DSSEIS, p. 18.

⁸⁹ Ecology, *Letter to Cowlitz County re Incomplete Shoreline Conditional Use Permit #1056*, p. 2 (October 9, 2019).

⁹⁰ Ecology, *Letter to Cowlitz County re Notice of Determination for a Second Supplemental EIS*, p. 1 (November 22, 2019) (explaining that Ecology’s questions were “not adequately addressed in the 2019 Supplemental EIS, nor were they adequately addressed in the County’s November 4, 2019, letter to Ecology.”).

⁹¹ Ecology, *Letter to State Legislators Re: SEPA Process for the Northwest Innovation Works Methanol Facility*, p. 6 (February 25, 2020); *see also* Ecology, *Notice of Second Supplemental Environmental Impact Statement*, p. 1 (November 22, 2019) (explaining that the SSEIS was necessary to “complete the analysis of the . . . potential mitigation of” the project’s impacts).

⁹² DSSEIS, Appendix D, pp. 1–2.

evaluate or approve NWIW's application for a CUP without these details,⁹³ and it would be arbitrary and capricious for Ecology to accept a mitigation proposal that is essentially identical to one that Ecology previously found insufficient.

Finally, to achieve the reductions in climate pollution we know are necessary, new polluters like NWIW must mitigate their emissions to well *below* zero. Maintaining current emission levels is not sufficient—current emission levels are causing the current climate crisis. We need robust, identifiable, and enforceable mitigation measures that lead to significant *reductions* and improve conditions for disproportionately impacted communities.

VII. The State of Washington Should Reject the Kalama Methanol Refinery.

The undersigned organizations⁹⁴ represent tens of thousands of Washingtonians and people across the Northwest working to protect the Columbia River, Kalama, and our climate from NWIW's petrochemical refinery. Commenters call on Governor Inslee and the State of Washington to deny the methanol proposal permits based on: the Washington Shorelines Management Act;⁹⁵ the substantive authority granted by SEPA;⁹⁶ the authority to control state-owned lands underlying Interstate 5 in the Kalama Lateral pipeline route;⁹⁷ and the public trust doctrine.⁹⁸ Permitting new fossil fuel infrastructure like NWIW's methanol refinery is the antithesis of addressing climate change—and the time to address climate change is now, or never.⁹⁹

⁹³ See WAC 173-27-130(5).

⁹⁴ Incorporated by reference are all previous comments submitted by Columbia Riverkeeper and others regarding this proposal, and exhibits thereto. Because those documents are already in Ecology's possession, they are not attached as exhibits to this letter but should be included in the administrative record for the SSEIS.

⁹⁵ See WAC 173-27-140(1) ("Review criteria for all development.") referencing RCW 90.58.020(1).

⁹⁶ RCW 43.21C.060.

⁹⁷ RCW 47.44.050; see also Columbia Riverkeeper *et al.*, *Letter to Governor Jay Inslee and WSDOT Secretary Roger Millar regarding Kalama Lateral Pipeline Right-of-Way Authorizations* (September 18, 2020).

⁹⁸ Cf. *Illinois Cent. R.R. Co. v. Illinois*, 146 U.S. 387, 459–60 (1892).

⁹⁹ Office of Governor Inslee, *Press Release: Inslee announces opposition to two gas projects in Washington* (May 8, 2019) (Governor Inslee explained that we have a "dwindling window for action" during this decade in which we must reduce emissions to half their *current* levels to avoid reaching an irreversible tipping point.)

CONCLUSION

The Kalama methanol refinery is a climate suicide pact. Washington should not accept NWIW's invitation to significantly increase greenhouse gas emissions out of fear that other governments will abandon their commitments to addressing climate change. In reality, Washington can neither predict nor control all of the political and economic choices that will shape our future climate. Washington can, however, prohibit NWIW's massive new source of climate pollution and, in so doing, provide hope and leadership to other governments facing similar choices.

Sincerely,

Miles Johnson, Senior Attorney

In Re: Kalama Manufacturing and Marine Export Facility Draft Second
Supplemental Environment Impact Statement

Director Doenges:

Thank you for this opportunity to comment on the proposed Kalama Methanol Plant.

FOGH (Friends of Grays Harbor) is a broad-based 100% volunteer tax-exempt 501(c)(3) citizens group made up of crabbers, fishers, oyster growers and caring citizens. The mission of FOGH is to foster and promote the economic, biological, and social uniqueness of Washington's estuaries and ocean coastal environments. The goal of FOGH is to protect the natural environment, human health and safety in Grays Harbor and vicinity through science, advocacy, law, activism and empowerment. We oppose locating any coal or other fossil fuel terminals in the State of Washington, and any expansion of such terminals elsewhere.

As we commented in our December 27th, 2018 letter, which we incorporate by reference, Washington State is a leader in clean energy and should not be approving the transport and storing of so dangerous a fossil fuel. In addition, we incorporate by reference those comments made by Grays Harbor Audubon Society, Earthjustice, Columbia Riverkeeper, Washington Environment Council, Center fo Biological Diversity, Washington Physicians for Social Responsibility, and the Sierra Club.

We find the following to be significant adverse impacts and are concerned that they were inadequately addressed in the SEPA/NEPA review process and this new Supplemental document.

1. The project proposes to create the world's largest methanol refinery, proposed on the Columbia River in Southwest Washington, would use more fracked gas than all of the Pacific Northwest cities combined and need massive new fracked-gas pipeline expansions throughout the region.
2. "Following the crude oil collapse in early March, the US methanol market was largely unchanged until later in Q2 as some domestic production issues were cleared up. Domestic product availability was widely viewed as more limited, but as production continued to run smoothly during Q2, oversupply was a top concern for much of the market. Consumption of US methanol in Q2 remained quite muted with less active than usual spot market seen for much of the quarter. Coronavirus weakened demand, particularly from China, impacted the global methanol market. Weaker demand caused US spot prices to sink to four-year lows as stricter coronavirus precautions implemented in much of the country". Source: *Independent Commodity Intelligence Services (icis.com)*. This seems to conflict with the "Markets and Trends" statement made in the Executive Summary. It is clear that proposed and planned facilities will have an effective lifespan beyond the time when all experts agree that we must abandon all fossil fuels. This means that these will be stranded assets and wasted economic investments. Are we considering another destructive white elephant for the Columbia River?

3. We reiterate, the Methanol plant would not meet Governor Inslee's package to transition to 100 percent clean electricity by 2045, as well as several other proposals to clean up electricity, buildings and transportation and a mandate for utilities to eliminate all fossil fuels, such as coal and natural gas, from the state's electricity by 2045.

4. Ocean acidification will only be increased as we continue to use and abuse fossil fuels. Our Pacific Northwest marine resource economy provides sustainable economic value to both tribal and non-tribal communities. Treaty rights and our coastal communities cannot be ignored by inappropriate development.

Sincerely,

Arthur (R.D.) Grunbaum
President

Washington State Department of Ecology'
Olympia, WA

Please, once and for all, stop the proposed methanol refinery in Kalama. That refinery's voracious daily appetite for 130m cu ft of *daily* mostly fracked gas is enough to destroy the climate on its own. That amount of fracked gas amounts to more than all commercial gas users in the State combined. Gas is a fossil fuel and fracking makes things even worse.

97% of the world's climate scientists are in full agreement that we must get off of fossil fuels and move instead to clean, renewable energy if we are to have a livable, sustainable planet for our future generations.

Thank you,
Mona Lee

R.C. Olson

Yes. Hello, this is [inaudible] Olsen. I'm a civil engineer and a certified construction manager living in Bellevue, Washington. I work all over the state. I look at any potential construction project as potential revenue for myself or people like me, but I think we have to look at a project like this with a global view, and especially a focus on our climate future. In my mind, and the minds of many, many other folks, this is a climate hazard project that will increase our climate change scenarios and do great damage to all of us around the globe.

I'm very much opposed to this project. It is not something we should be looking for jobs as a justification for it. I think we know that clean energy projects have much in the way of jobs potential and that's where we should be focusing. I thank the Department of Ecology for doing this analysis and providing the opportunity for public comment and urge you to reject this project's permit application. Thank you.

Re: Kalama Manufacturing and Marine Export Facility Draft Second
Supplemental Environmental Impact Statement

I have a hard time seeing any rationality for development of this methanol plant, esp. in 2020 with all the environmental problems this is going toacerbate.

Trying to use the inefficiency of other methanol plants as an excuse to build this plant - is not an answer. Upgrade those plants – don't add another plant!

The source is from a pipeline from the tar sands of Canada – the dirtiest oil on the planet.

The plant is being constructed for Chinese plastic! How irrational is that?

What are the chances for an explosion? How about an oil/methanol spill? How about ship wrecks?

All these potential problems for 200 jobs?

The only way this gets passed is “under the table”!

Mike Conlan Redmond WA

Cc: Director Laura Watson, Governor Jay Inslee, Senator Maria Cantwell,
Representative Susan DelBene, Columbia Riverkeeper,

MaryAlice Wallis

Hi, this is MaryAlice Wallis. I've been a resident of Longview, Washington since 1972. My husband and I have raised our family of four in Longview. We love our community. It was founded by Robert A. Long a person with a grand vision for development and industry along our wonderful Columbia River water highway. As a taxpaying citizen homeowner and business owner, I have been concerned over the last several years at the great difficulty of seeing where the industries turned away from establishing in Southwest Washington. I am concerned for the welfare of the citizens that reside in my City of Longview, where I currently serve as the mayor. Our families need real jobs. Our region and state need real investment. Seeing citizens in our community without work or having to travel long distances to find work is discouraging.

I'm in full support of the Northwest Innovation Works. I appreciate the review done by the Department of Ecology. Those who continue to ignore the science behind this project are only fooling themselves. In addition to global greenhouse gas reductions, Northwest Innovation Works will mitigate for 100% of its in-state emissions, even those not directly tied to its facility 100%. This will create investments in renewable natural gas development, saving and improving forest lands and practices, and driving other innovative greenhouse gas reducing technologies and opportunities locally, regionally, and globally.

What further excites me about Northwest Innovation Works is not only will this project helped to employ 1,000 workers during construction and 200 into the operation of the facility upon the completion of construction, it will also generate \$30 million to \$40 million in new state and local taxes. The investment of Northwest Innovation Project provides a much-needed boost to our struggling Cowlitz economy. Please, please, issue permits for this project to proceed. Please listen to the folks that reside in this community

Rich Doenges
NWIW SSEIS
Washington Dept of Ecology
PO Box 47775
Olympia, WA 98504-7775

Mr. Doenges,

I am writing today in support of the methanol facility in Kalama, proposed by Northwest Innovation Works. The draft Second Supplemental EIS report released by Ecology has again upheld the assertion of a global greenhouse gas net benefit. I believe the process should be completed and permits for the project approved without further delay.

Cowlitz County is a rural county that has seen high unemployment for decades. The economic impact of this project would be in the form of the creation of many new family wage jobs along with tax revenue for critical community resources.

The benefits from both the environmental and the economic outcomes make this project one that should be a priority for Washington State. The science behind the environmental impact study has answered the question of environmental benefits, and given the events of this year, the economic benefits are of vital importance to Cowlitz County.

I would ask that you consider the prompt approval of this project and allow the process to go forward without further delay.

Regards,

Senator John Braun
20th Legislative District

Kevin Tempest

Thank you for the opportunity to speak today on this important and complex topic. My name is Kevin Tempest and I work as the R&D scientist for the Low Carbon Prosperity Institute.

The rapidly dwindling greenhouse gas budget demands resource allocation only with high confidence that long-term benefits outweigh costs. Other Pacific Northwest export proposals have merited rejection on GHG grounds. This one looks different. According to analysis I completed in late 2018, global GHG emissions are likely to be 2 million to 7 million tons per year lower with this facility than in its absence. The draft analysis arrived at similar conclusions through its own separate methods providing an increased competence.

Across a wide range of assumptions such as methane leakage, global warming potentials, and methanol end uses, 47 different scenarios forecast a very likely range of 2 million to 9 million net emissions avoided per year and an extremely likely range of 0.25 million to 12 million net avoided emissions per year. That is before consideration of in-state emissions mitigation that is much more ambitious than Ecology's own clean air rule. While Kalama Methanol is likely to remain lower-emitting than prevailing alternatives, confidence diminishes further out in time.

In a sector that Governor Inslee's ambitious evergreen plan found is the costliest to decarbonize, demand for methanol and plastics is forecast to continue to grow through at least mid-century, even under low carbon scenarios that maximize recycling in the circular economy, such as those from the energy transitions commission, and the International Energy Agency. Longer-term prioritization of carbon capture and finite biogas resources are the clear leading candidates to drive emissions towards zero. Combined, these technologies are actually carbon negative. This facility can and should be ready to adapt to these technologies and trends in order to minimize the risk of becoming a net-emission source and increasing the odds of compatibility with the net-zero emissions future.

Thank you for your time.

P.O. Box 47775
Olympia, WA 98504-7775

Dear Mr. Doenges:

Thank you for your service to the residents of Southwest Washington!

Please allow me to give you my personal perspective of the proposed methanol plant at the Port of Kalama. I favor it for a variety of reasons. My vote is to approve the NW Innovation Works plan.

1. I treasure the Kalama River which I have fished yearly for 55 years. Therefore, I hopefully have considered all risks emanating from the Northwest Innovation Works plant which you have been evaluating.
2. My wife and I have lived directly on the Kalama River for the last 23 years. Certainly we have a more vested interest in the general safety of the Kalama River Valley and its surrounds than someone from Portland or Hood River.
3. My wife and I fully support the Kalama School District as evidenced by our voting for additional funding for proper instruction in quality local schools. Our taxes have increased substantially since we moved here. To be exact, our property taxes this year for our Kalama River Road properties total \$10,495.37. You can see that my wife and I are contributors who have a vested interest in the safety of our Kalama community. It seems to me we have more legitimate concerns over the proper functioning of the proposed methanol plant than some critic with nothing to lose.

Mr. Doenges, you and I are like partners. Your vision is to sustain healthy land, air and water in harmony with a strong economy. My wife and I want the same as you and the Department of Ecology. Basically, we are satisfied with the reasonable risk of the new methanol plant. What we need are the economic benefits from the methanol plant. Only you can authorize that. You know the tax benefits and the employment benefits from the new plant. My point is that your vision and mine are compatible, but we need your plant authorization to achieve all the mutual benefits.

Mr. Doenges, your stated mission is to protect, preserve, and enhance the environment for future generations. We are partners in this mission too. We want the same as you.

For your information, I have talked with astute, local businessmen I respect, and they feel the same as I. Progressive people inherently want progress. Non-contributors often want the status quo, and outside critics typically challenge, gripe, fuss and conjure up negatives to make themselves feel important. You and I want sensible progress in accordance with your vision and Ecology's mission statement.

It is my hope that the methanol plant can be build soon. It will be a great example of American progress and ingenuity. It will help a lot of people.

Respectfully yours,

Walter B. Pistor

Carrie Parks

Hi, my name is Carrie Parks. I'm a longtime resident of Vancouver and I love our natural surroundings in this area. I want to talk to the methanol supporters and tell you to wake up and smell the smoke-filled air. Do you want to destroy the livability of your town and lock us into another 40 years of poisoning the planet? Why are you pursuing a dying industry that will put your people out of work in a few years? That is if they survive the wildfires, the droughts, the storms, the pandemics, and the food shortages being caused exactly by the kind of pollution you want to pump into our air. Building this factory will leave you behind in the new economy.

California is making its buses fully electric by 2040 and putting through 300,000 zero-emission trucks on the road by 2035. Portland is building generators that will make electricity by bobbing up and down in the ocean. Spokane is building an electric sports car and battery factory that will create up to 3,000 jobs. I'd like to direct you all to www.drawdown.org which has a lot of ideas on climate solutions. One is putting small turbines in the river whose blades turn as the water flows past naturally capturing the energy. Such a system could reduce carbon emissions by 1 to 3 gigatons of CO2.

Just retrofitting existing buildings could provide lots of good construction jobs while improving people's lives. Retrofits could cut energy use by 40% and avert tons of greenhouse gas emissions. You could do all of those things here in Kalama instead of a dirty industry.

Since ecology is comparing the effects of carbon emissions from the methanol plant to that from burning coal, it should also include an analysis of emissions from the methanol plant in comparison to sustainable alternatives like these. Look for better cleaner technology and longer-lasting jobs instead of turning your beautiful town into a dirty industrial center. Deny the permit.

RE: Personal Comments: Kalama Manufacturing and Marine Export Facility Public Hearing" September 17th by Bob Zeigler (Retired WDFW Biologist and SEPA Responsible Official, Member of Pax Christi – Catholic Peace and Justice Movement in Association with Earth Ministry) Concerned Citizen over Increasing Climate Catastrophe and Actions by State on Fossil Fuel Expansion Projects.

Statement begins:

My Name is Bob Zeigler and I live in Olympia, Wa. Thank you for the opportunity to comment on the EIS on this Methanol Processing and Export facility on the banks of the Columbia River. I first want to complement you on listing significant direct impacts on the projects such as it being one of the top ten greenhouse gas emitters in our state. This is an excellent introduction and a practice that should be kept in EIS's on upfront impact summary.

The problem I see is in the discussion of mitigation in the interior of the document and appendices concluding that greenhouse gas impacts will be mitigated 100% over its life of 40 years in a process currently undefined by partners to be determined later by staff not yet funded nor guaranteed funded for 40 years nor can we count on the guarantee of political will to carry through. In state government we see many unfunded mandates that suffer staff cuts and intended actions do not get done. All resource agencies experience this in budget cuts in lean times. The compensatory mitigation stated for one of the top ten greenhouse gas emitters, while intended, appears to possibly be just a hope and a wish. Is this appropriate to justify permitting a project on a hope of replacing current and future losses of climate impacts in a project that would increase release of greenhouse gases? There is also the limitation that the compensatory mitigation has to be "cost effective".

The EIS has no risk analysis of catastrophic event: war or sabotage, earthquake, tsunami, break of upstream Columbia River dams, methane explosion.

Question: Was the Exxon Valdez spill ever mitigated anywhere near 100%? Catastrophic events can and do occur over the life of projects.

Question: How are secondary impacts of methane discharges along transmission lines or drilling and withdrawal from below ground compensated for, when often not recognized?

For 20 years scientists have been warning us about the dangers of climate change to existence of life on our planet. For the last 5 years prophetic voices in our faith communities have been

calling us to urgent action to keep fossil fuels in the ground and rapidly transition to renewable energy sources.

Now in our Faith Communities we are entering a time of special focus on healing the earth and protecting creation. This Friday starts **Jewish High Holy Days with Rosh Hashanah** and ends October 4th. In Catholic, Episcopal and Lutheran Communities from September 1 until October 4th (Feast of St. Francis) celebrate **The Season of Creation** with a focus on protecting creation, controlling climate change through individual (Lifestyle) and collective community efforts to restore the earth and divesting from fossil fuel industries for transition to renewables and reforestations.

Pope Francis in announcing Season of Creation states: "Climate restoration is of utmost importance, since we are in the midst of a climate emergency. We are running out of time, as our children and young people have reminded us," and strengthened regulation of "the activities of extractive companies" to "ensure access to justice for those affected," especially Indigenous communities."

That is the reason I come to speak at this hearing in addition we are now experiencing the worst air quality in the nation from our fires and seeing numerous Gulf and East Coast hurricanes and storms, floods and droughts. We see clearly **today** that climate change is here and is not healthy for our children and other living things. It leaves us with severe economic problems as well.

Thank you.

Bob Zeigler
Olympia, WA

Don Steinke

Good morning. I'm Don Stanky, retired physics teacher. We are being given false choices, either choose this project or choose whatever the market decides. Our colleagues around the world will fight those other projects. They stopped 15 LNG export terminals in British Columbia, stop the two pipelines on the East Coast, and twice defeated one in Coos Bay. Plastic bands are occurring all over the world, our colleagues are counting on us to do our part and stop this project.

Our climate system cannot afford either one of those choices. We are close to the point at which global warming will not stop until temperatures have risen five degrees celsius, which would be the end of civilization as we know it. Toyota proposed the Prius in 1988 and it was a good idea at the time, but even a Prius factory built in Kalama today would not be compliant with policy in China now. China told the automakers go all-electric or go home.

China leads the world in wind, solar, and battery-electric buses. They have 400,000 battery-electric buses, and we have what? 400? China's signed the Paris Climate accords. Even if all the speculation in the EIS actually happened, this project would not comply with that agreement. You should not approve a project unless you know all the facts. Don't guess at the methane leaks in the pipeline measure then.

The home base, where the pipeline airplane is in the Pearson airport in Vancouver, attached methane sensors to those plants. Five days ago, Bloomberg reported that gas companies are abandoning their wealth, leaving them to leak forever. Just one of them in California could have emitted 30 tons of methane, and there are millions more like that. Include those facts--

Cathryn Chudy

Hi, my name is Cathryn Chudy, and I'm a longtime resident of Vancouver, Washington. For more than 30 years I have worked with suicidal children from all over Washington and Oregon. One thing these kids have in common is that they do not see a future for themselves. A second thing is that they do not trust adults in their lives to make wise decisions on their behalf.

There is a struggle going on here between adults who are fighting for a safe and healthy future for their children and grandchildren and adults who are pursuing an outcome that puts that healthy and safe future at risk for no reason other than the pursuit of short term fossil fuel profits at the expense of the long term welfare of our state and our region. We are blessed here in Washington that many of our elected representatives recognize the risks that our children face going forward if fossil fuel businesses usual is allowed to continue unrestrained.

That is why Washington has set aggressive climate goals that limit gas emissions in order to protect us from the harm we are already suffering because of the climate crisis we are in. We are at a crossroads in determining how we will all move forward in achieving Washington's greenhouse gas reduction goals. On one side is the fossil fuel industry trying to persuade us that fracked gas to methanol, to plastic and fuel in China is somehow a pathway to a speculative lower carbon future.

The company that is cleverly attempting to greenwash this pursuit of profits at our expense wants us to ignore the reality that tons of greenhouse gas pollution each year will be dumped into Washington for the next 40 years and it'll magically go away with the voluntary promise to mitigate what is really non-mitigatable. On the other side are the multitudes of we the public, who are showing up and reminding you that speculation is not fact. That voluntary mitigation of polluting greenhouse gases is not good enough ground to stand on when it comes to the health and safety of our environment and the future of our children. The only path to meeting our state's climate goals and ensuring a safe and healthy future for generations to come is to deny this proposal and the shorelines permit. Thank you.

Matthew Hepner

Hello, my name is Matthew Hefner. I'm the executive director of the Certified Electrical Workers of Washington, and the legislative and Policy Director for the International Brotherhood of Electrical Workers. I want to start by saying thank you to Ecology for its diligent work, and its leadership in setting precedent for responsible development. This is really groundbreaking and a true environmental win.

I'd like to thank NWA and the environmental stakeholders for creating cutting edge PIS precedent that will resonate throughout the country on mitigation. I'm in support of this project the IBEW, we backed 100% Clean Energy Act. We were the first union to be involved with that, we're the first union to support the low carbon fuel standard, and testify in the legislature as such. It is because we differently support responsible and inclusive environmental policy that we support this project.

If we are serious about transitioning to a clean energy future, that also means clean manufacturing. All things cannon will be used in clean energy products, and a clean energy future products for EBs, for wind turbines. This is a crucial project to get to a clean energy future. Thank you, and please support this project.

Pillip Norman

This is not an energy project in service to any local users deserving of state respect. The project imagined is purely is purely a forbidden export scam. Public commons are exploited and ruined forever, so that greedy investors in charge of a theft, may sell buried treasure for personal profit. The treasure of stored energy has value for all but those greedy, only if kept in the ground, undisturbed. Sensible people will put an end to fracking ruin. A livable planet for our deserving descendants, requires that we, now, learn to live responsibly.

Earth Ministry

Hello, my name is Maddie Smith, and I'm part of an organization called Earth Ministry. We organize people of faith throughout the state of Washington for environmental and climate justice. I'm a Unitarian Universalist and one of my faiths key principles is the respect for the interdependent web of all existence of which we are apart. It's clear from the SSEIS that ecology knows we're all connected, as you've taken a look at various scenarios of greenhouse gas emissions for the world. Whether this project is built or not.

As a person of faith, it's also clear that if 2020 has taught us anything, is that we are in a time of great moral reckoning. Right now we are all called to be prophetic and envision a future that is different from one shown in a model where climate pollution increases no matter what we do. We know that to create a livable future for future generations, we can't continue with business as usual. I'm a young person, and worry about what the world will look like in the 40 year lifespan of this proposed project. It's clear to me that we can't continue with business as usual, and that we can't assume that other similar projects around the world will be built if this project is not built.

As a person of faith it's also really important to me, that we listen to the indigenous folks who have always lived in this land. The person from the [inaudible] tribe who testified earlier. We have to listen to the folks that have stewarded this land and if they're opposed to this project, we must also be. Thank you.

Marlene Meyer

I'm Marlene Meyer, resident of Washington for over 21 years. I'm here personally to talk about the same things that many people have already brought up, the tribal convents, the Sierra Club. By the way, we do have a trans child who is been loved and living in a good condition, but I do know most of them are rejected by families and have a very difficult time, so I found your comment interesting. In respect to the project, I'm also in agreement that we are comparing two negatives, and I really am surprised in the state of Washington, with our progressive ideas about reducing carbon emissions that we are even comparing these two negatives. Currently, I am calling you from California. I am staying in a city that was developed around oil refineries with commitments and promises to help the people in the area and to not be polluted. This is a very sad area I'm living in. It's depressing to see what's happened here. They have the ninth worst polluted beach in the state. What was going on in the history of the building of this with a commitment to clean production for the future? Did they not foresee the future? Did they not plan for it? How can we foresee what's going to be coming up here and there is not a commitment on paper for clean up by this company. Even if there is, how do you clean up thousands of marine life?

Don Steinke

You cannot allow the DSSEIS to stand as is without knowing who monitors the pipeline for leaks and how soon they repair Class 3 leaks.

In this story, from Franklinville NY, we learn that there were three classifications of leaks. And we learn that a pipeline company allowed a leak for over a year and had not scheduled it for repair because it was a Class 3 leak, in a remote area.

https://www.niagara-gazette.com/news/local_news/southern-tier-pipeline-leak-response-stirs-local-concern/article_f4824e45-2ce7-5e1f-9487-b84f4f66d210.html

Jennifer DeCent

My name is Jennifer Dissent and I live here in Collins County in Ariel. I'm a business agent for Laborers International Union of North America, local 335. In my now 15 year career as a laborer, I've had the opportunity to work on environmental crews. This crew is comprised of highly skilled, trained laborers, dedicated to preserving and protecting the environment. Allowing the Northwest Innovation Works Kalama Methanol facility to move forward will have a positive impact on the environment. With a plan to include tribal labor, environmental and environmental justice members on its governance board.

A carbon reduction project dedicated to the fight against climate change benefiting our community every step of the way. Thank you for this opportunity to make this comment. I want to end on this note, Washington state can and should set the highest standards and lead other States, our nation and other nations. Please approve this project as a great example to drive those high standards.

Eileen Fromer

Hi. My name is Eileen Fromer, I live in Portland. I'm passionate about the climate crisis and about stopping greenhouse gas emissions. I believe that the department of ecology has an opportunity through its analysis and these hearings to do the right thing. Simply, that is to deny the shorelines permit for the Kalama Methanol refinery. On its website Ecology states, "Washington is a national leader in cutting greenhouse gas emissions to prevent climate change." Now they state that the Kalama Refinery would be one of the top greenhouse gas polluters in Washington, emitting 4.6 million tons of carbon pollution annually for 40 years. How on earth can Ecology claim to be cutting greenhouse gas emissions and approve this shoreline permit?

The under estimated methane leakage from natural gas extraction, transmission along the pipe route and the refinery, and after the methanol leaves the refinery, what then, first it was just going to be used to make plastics, as if plastics are not already an environmental disaster, but at least the methanol wouldn't be burned for fuel. Then they changed their story. So 40% might be burned as fuel yielding 2 million tons of carbon pollution each year, and there's no guarantee that all the methanol won't be burned. We are in a climate crisis, the wildfires are here along with the drought, storms, floods, and displaced people all over the world. It's time to say no, enough is enough. Washington and the department of ecology must live up to their claim and be a leader in addressing the climate crisis.

Norm Cimon

Yes. So, I'd like to, first of all, point out that the static market analysis is not very useful. These markets are changing so quickly that a dynamic analysis is really where you want to go. In other words, this is going to be changing very, very quickly. I'm in Oregon, I'm a systems analyst. I've worked for the US Forest Service, my own company, I worked for the EPA years ago. The crucial issue for me is that you have not examined all of the upstream costs, specifically, gas companies are now abandoning their wells, leaving them to leak methane forever. You need to go back to your analysis, go back to the upstream portion of this and start looking at that seriously.

What I mean by that is that you can do a probabilistic analysis, that's what people do, and actually get some idea of how much additional methane will be coming out, given that a lot of these wells are simply going to be abandoned. This project, as far as I can tell is not one that is designed to do anything that will benefit the environment. Looking at, and someone said, the two negatives, it's not the way to go.

Right now, Melrose, I think it's Malden, Washington has gone. We've lost any number of towns here in Oregon. The mantra I live by is that short term self-interest is greed, long-term self-interest is morality. I would ask you do, essentially the work of some serious long-term interests and make a moral decision. Make sure that this project does not go forward, we're losing too much at this point. Thank you.

Luke Henkel

Thank you so much for the chance to speak and share. I'm Luke Henkel and I work closely with Earth Ministry and on the Care for Creation team at St. James cathedral. I'm living in Seattle, Washington but very invested in opposition to this project. I just was on a trip this last week with [inaudible] sailor sea, walking from Mount Rainier to Houma down to the mouth of [inaudible] river and I was hearing the whole week about how proposed projects like this Kalama Methanol facility are 80%, 87%, 90% likely to fail at some point along the pipeline infrastructure.

Having lived in the Pacific Northwest for much of my adult life, I know what a green area we are, how likely we are to be known all over the world as this progressive place. I've heard a lot of science during this hearing but I just want to take a step back and talk simply. We've heard all of these facts, we've heard all of this data on both sides of the argument of whether or not we'll have this facility and for me, it's just convenient excuse to hide the fact that this is wrong.

We heard from Maddie Smith, who's part of Earth Ministry and she's wanting to say this is a moral reckoning. We're faced this year, 2020 as she said, if nothing else has taught us this year from all the crises we faced, we have the chance now to really pay attention to what all of these crises are teaching us and learn from them. Get it right, learn how to work together, learn how to say no to the things that we know are wrong. Forget all the data, forget all this slides that we're going through and just pay attention to what the indigenous leaders are telling us, to what the simple facts are and they are, this cannot go forward. If we want to have any chance of getting ahead in 2021 and beyond. Thank you so much.

Don Steinke

Although you seem to be limited to GHGs, you cannot ignore the seismic risks of this project. When EFSEC and Gov Inslee rejected the Tesoro Savage oil terminal proposed in Vancouver, they didn't base their rejection on climate, they based it on seismic risks which could not be mitigated. We heard from a geology professor that the seismic risks in Kalama were identical to Vancouver. He said that although the boundary of the subduction zone is off shore, the actual place where the plates would get stuck could be right under Kalama. That risk cannot be mitigated. Furthermore, when we have a major seismic event, (we're overdue) and the pipeline ruptures and the refinery, what number would you assign to the emissions. It is not if but when. It is likely to be larger than any seismic event in California.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

"Natural Gas isn't a Bridge Fuel; it's a Gateway Drug."

John Farrell

According to the Hearing on the Kalama Methanol Refinery in Cowlitz County on page 9/30, it states:

The project would require one-third of the total amount of natural gas currently used in the State of Washington, making the project the state's single largest consumer of natural gas, and possibly impinging of the state's available supply. Should the amount of natural gas used by this project be considered when reviewing this shoreline application?

How will we ever lower our dependence on natural gas if one company's demand is equal to 1/3 of the entire State of Washington? Is this refineries expected 30- 40-year lock on natural gas really a way to move us away from fossil fuels?

I know that the people who work at The Department of Ecology say that we can just let this one go through. This seems like the best of the worst. This is the wrong kind of thinking; this one approval means multiple massive fossil fuel projects will make your jobs even more distressing. This will open the floodgates of new endeavors of fossil fuel projects; the thin green line would be broken. The word would get out; they have found the key to open the gates.

Policy decisions need to be made on the most effective hierarchical order of gas allocation between domestic and foreign sectors to facilitate economic development and prosperity for all SW Washington.

The Climate Crisis Requires That We Move Away from Gas

June 26, 2019, Sheryl Carter Bobby McEnaney

These are long-term, expensive investments that have a good chance of becoming uncompetitive, or economically "stranded," since there is much cleaner, cost-competitive (or soon to be) alternatives to reach our climate goals. That means we will still be paying for these investments long after they are no longer economically or environmentally viable, resulting in higher energy bills, lost jobs, and financially unstable utilities.

I will never understand why we spend millions of dollars in energy-efficient appliances in homes, use low flow toilets and washers, and insulating our homes and businesses to save on gas heating only to have one company come in and take all of the savings. This company should reimburse the citizens and businesses the millions of dollars that have already been invested trying to reduce our carbon footprint.

Having one company take 100MW of power, 320 million therms of natural gas, and 4 million gallons per day is an astronomical amount of our NW resources. I think that's why there has never been another ULE methanol refinery built since the prototype 30 years ago; no country can give up

that much of its limited resources. How many companies will not be able to use these essential non-renewable resources when they are desperately needed years down the road?

This project's shortfall would be a great documentary film that will probably be seen on Netflix. It has all the makings of extreme short-sightedness of elected officials and agencies not unheeding the warnings that were supposed to protect the people of Washington for centuries, and not just for decades. People have already started thinking of which actor or actress that will be playing their part.

Hollis Dye

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. The methanol plant at Kalama should not be built, we should be looking into other alternatives other than fossil fuels. With all the technology that is coming on line and the harms we know that fossil fuels have had on the global climate, it is time to do the responsible thing and look for alternatives. No to the Kalama Plant.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Hollis Dye
PO Box 453 Grapeview, WA 98546-0453
hjdskeezix@gmail.com

Catherine Ruha

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We can't thrive with polluted waters and air! This short term thinking is criminal. This short term thinking is killing humans and everything else on this struggling Earth. Imagine loving the world instead of treating the world as some form of trash receptacle for our human inability to change. Imagine a cleaner world where you approve human projects that heal and nurture a healthy relationship with the community, water, and land of Kalama and Washington State.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Anne Bryant

I am strongly opposed to the the second Supplemental Environmental Impact Statement (EIS) for the Kalama Manufacturing and Marine Export Facility.

Although I live in Portland, OR and not in the state of WA, the fate of that ancient, venerable river, the Columbia, is the fate of the entire region. Bringing methanol to this region is too great a risk to this bioregion.

It's enough reason for me to say NO to this project that the Cowlitz Indian Tribe is opposed to this second SEIS. Their assessment is that the project would irrevocably damage their ancestors's cultural resources and already altered natural landscape. It would permanently ruin the lower Columbia and ruin salmon and wildlife habit.

Rather than invest in development of a project that could become a stranded asset in a number of years, why not invest in sustainable jobs for the Kalama area?

Marilyn Cornwell

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

The environmental devastation caused by the fracked gas refined into methanol begins right when is fracked from of the ground. Leaks during fracking, transportation, refining it into methanol, and then shipping the methanol overseas, are links in a chain of pollution around the neck of the people and creatures of this land that will directly contribute to greenhouse gas pollution. The cry that we cannot breathe becomes ever greater if that chain tightens.

It is our moral and spiritual obligation to confront the misinformation, speculation, and omissions about the environmental effects of methanol production by NW Innovations Works in the environmental impact statement. The environmental costs to the many far outweigh any profit that will be made by a few.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. mmcornwell@live.com

Kathleen Grimbly

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

The Kalama is home to Spring Chinook which are crucial food for endangered Southern Resident Killer Whales. Why spend millions on salmon recovery while endangering this remnant population with the effects of fracking?? Seems a bit like the left hand not knowing what the right is doing.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms. Kathleen Grimbly

Arlene Hobson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

We need to be investing in a livable future that is safe for all to thrive, especially the young people of our state and nation.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Arlene Hobson

Washington State Department of Ecology
Olympia, Washington

Re: Formal Comments on Kalama Manufacturing and Marine Export Facility Draft Second Supplemental Environmental Impact Statement, September 2020

Please deny Kalama Manufacturing and Marine Export Facility (KMMEF) a shoreline substantial development and a conditional use permit. The environmental impacts from the project are significant and cannot be mitigated.

Greenhouse gas emissions are insufficiently explained in the draft second supplemental environmental impact statement (SSEIS) and the data contains errors and omissions.

The SSEIS asks a basic question. How much CO₂e will be produced in refining 3.6 million metric tons of methanol per year?

When science looks at a question and comes up with an answer the usual first response to the answer should be another question. Is the answer reasonable? In the case of NWIW the answer is no.

Looking only at methanol process, from Table 3.5-2 GHG Emissions from On-site Sources, the ULE process and purchased power (the 100 MW demand required for the process) will produce GHG emissions ranging from the low estimate 728,535.7, to mid estimate 915,121, to the high estimate 1,347,803 MT CO₂e/year.

The high estimate means 0.374 metric ton of GHG would be emitted for every metric ton of methanol produced. The low estimate yields 0.202 metric ton GHG per ton of methanol.

The methanol industry would likely find these answers ludicrously implausible.

"Ten or more years ago, a typical methanol manufacturing plant would emit about 0.9-1.0 metric tonnes of carbon dioxide for every ton of methanol produced. In addition to the environmental concerns, large CO₂ emissions represent operational inefficiencies in a methanol plant, since the carbon emitted as CO₂ is not available for making methanol molecules. In fact, excess CO₂ from other industrial facilities can also be captured and consumed to increase methanol production. Through the implementation of efficiency improvements and through replacing of older facilities with newer plants that use more efficient technologies, over the last decade methanol plants have been able to significantly reduce CO₂ emissions by up to 40%. Some facilities report emissions as low as 0.54 tonnes of CO₂ / tonne of methanol produced. This is equivalent to emitting 3.8 lbs of CO₂ per gallon of methanol."
<https://methanolfuels.org/about-methanol/environment/>

The ULE process is not new. It is based on a small prototype, the Coogee facility in Australia,

operational more than twenty years ago.

Here is what I told Southwest Clean Air Agency about the Coogee ULE process in my comments January 2019 regarding extension of NWIW Kalama's air discharge permit.

"The ULE process is not a conventional methanol process with conventional equipment and has only been used in one small facility that has since been closed, the Coogee Methanol Plant, Laverton North, Victoria, Australia, operated by Coogee Energy Pty Ltd.

<https://insider.thewest.com.au/august-2017/power-played/>

The best information on the Laverton Coogee methanol process and emissions can be found in Coogee Energy Pty Ltd Methanol Plant Environment Improvement Plan, December 2003.

Attached.

http://s3.amazonaws.com/zanran_storage/www.coogee.com.au/ContentPages/1245343343.pdf

This was the plant's third improvement plan (EIP). They had problems. They admitted it was an experimental process that needed improvement.

"The Coogee Methanol Plant is Australia's only methanol production facility, and is currently capable of producing between 70,000 to 80,000 tonnes per annum of chemical grade methanol. The plant operates 24 hours a day, 7 days a week, all year round." EIP p. 10 The Coogee methanol plant had capacity to produce in one year what NWIW Kalama plans to produce in 8 days. In other words, the NWIW production capacity is proposed to be about 45 times greater than the prototype on which it is designed.

In 2003 the Coogee plant had been operating almost ten years. Their aim was to produce methanol with greater efficiency and less CO₂e emissions. The EIP states in 2002 that 0.781 Tonnes CO₂e were produced per tonne of methanol, EIP p. 21. If this emission rate were applied to NWIW Kalama production of 3.6 million tons methanol per year, then NWIW would be emitting 2,811,600 tons of CO₂e annually at the refinery site alone, over twice the estimate projected in the ADP."

When scientific inquiry reveals extraordinary results, extraordinary proof is required. The unrealistically low emissions Northwest Innovation Works claims will result from their ULE methanol process demands extraordinary proof. Chemical equations describing a perfect process are not sufficient or realistic.

Demand real world examples the NWIW ULE process will produce the extremely low emissions as claimed on a large industrial scale.

Thank you,

Diane L. Dick
Longview

Barbara Bengtsson

The proposed Kalama Methanol Plant presents yet another false solution to the problems we are faced with in this pivotal time. A time marked by disasters, inequality, and a sense of uncertainty, if not doom. Wildfires and storms are increasing in severity and destructiveness; devastating droughts are followed by ruinous floods; from the Arctic region to the Antarctic continent, ice and glaciers are melting. We are not only reading about these disasters, many of us are living through them. Thousands lost their homes in recent years - on the west coast to wildfires, on the east coast to hurricanes. We know the cause of these calamities, climate breakdown driven by the burning of fossil fuels. We have known this for over 40 years - James Hansen first testified to congress about global warming in 1988 - yet instead of decreasing global emissions, we almost doubled them by 2017.

The possibility of changing course, still exists. If we follow the recommendations of the IPCC and reduce emissions by about 50% in the next ten years, we can still prevent the earth's climate from completely spinning out of control. This is why the proposal to build a large methanol plant at the mouth of the Columbia River is utterly preposterous. Any project that relies on the continued extraction of carbon from the earth, where it is safely sequestered, sets us on a dangerous path to irreversible climate disaster.

But climate disaster is not the only threat exacerbated by continued fracking and drilling. If, as the proponents claim, the methanol produced by this plant would be shipped to Asia and used in plastic manufacturing, it would contribute to the ecological disaster caused by the rapacious use and discard of plastics. Today plastics are ubiquitous components of our environment. Most of us know about the "Great Pacific Garbage Patch," which turns out to be not so great for life in and around the oceans. Plastics are making their way into the stomachs of whales, fish, and birds. Not even remote islands are safe from their toxic reach. In the Pacific Ocean's Midway Atoll, an Albatross nursery, chicks are dying of plastic pieces unwittingly fed to them by their parents. Scientists are predicting that by 2050 there will be more plastic than fish in the world's oceans. Is this the earth we want to leave behind? If innovation were truly at the core of NW Innovation Work's business model, the company would work on developing more efficient, effective and sustainable processes for collecting and recycling the plastics currently in circulation instead of proposing to make more.

If the methanol would be used as fuel, it would worsen the climate crisis by contributing to greenhouse gas pollution and by delaying the adaptation of renewable energy sources. Data suggests that fracking operations are leaking much more methane than previously estimated. While more research is needed before a final conclusion can be reached, circumstantial evidence is strong. The New York Times reported last December that "Methane levels have soared since 2007 for reasons that still aren't fully understood. But fracking natural-gas production, which accelerated just as atmospheric methane levels jumped, is a prime suspect."

Methane is a powerful greenhouse gas, 80 times more potent than carbon dioxide. Although it does break down after about 20 years, this does not help us. Climate research determined that we have only ten years to reduce fossil fuel consumption by half to prevent irreversible climate destruction. Therefore, as Ecology notes, "the Washington Legislature has adopted aggressive limits to reduce our state's emissions in the years ahead."

Permitting the construction of what "would be one of the 10 largest sources of greenhouse gas emissions in the state," would sabotage the emission limits our legislators worked hard to establish. Ecology's Second Supplemental Environmental Impact Statement (SSEIS) shows that "if constructed, the proposed Northwest Innovation Works methanol facility would" be responsible for at least 4.6 million tons of carbon dioxide emissions per year. Nonetheless, the authors of the SSEIS hypothesize in their conclusion that global emissions would be worse without the Kalama plant, based on the assumption that the methanol produced in Kalama would replace methanol produced from coal. That assumption is flimsy, if not misguided. If anything, the current pandemic is teaching us how quickly predictive models can fall apart. Approving the construction of this facility would set us on a dangerous path to irreversible climate breakdown.

Mitigating climate and ecological breakdown requires us to treat the root of the crises. We need to leave carbon in the ground, stop burning fossil fuels, and limit the production of plastics. I am urging Washington's Department of Ecology to step up to the task and stop NW Innovation Works from constructing what would be the world's largest methanol plant in Kalama.

Sally Keely

Ecology caught the shell company Northwest Innovation Works in yet another lie. On page 13 of the DSSEIS Ecology describes how the methanol produced in the Kalama Methanol Refinery could be burned as fuel, even 100% of it burned as fuel, despite the first amendment of the dock use agreement between the Port of Kalama and NWIW. The June 2019 amendment(1) states, "No quantity of methanol produced at the Facility shall be sold for use as fuel products." Frankly this is contradictory to logic, reason, and public statements made by company executives.

As Ecology noted, once a tanker leaves dock, the product on board can be sold to anyone on the global market including wholesale commodity traders who could sell the methanol to other middlemen. Sale records would be impossible to track. Port has no way to enforce what the Chinese government does with the methanol or even if its destination is China.

The amendment says that NWIW will self-report any violations. But we know that NWIW is not credible, there have been so many lies. The Port and NWIW have a very cozy relationship. We rarely hear from NWIW, the Port Commissioners seem now to be NWIW's spokespersons.

In terms of the end use of the methanol, NWIW tells one thing to potential investors and another to the public and regulatory agencies. Reporting in April 2019, Oregon Public Broadcasting, our local PBS, caught NWIW in a major lie, telling investors the methanol is to be burned as transportation fuel while telling the public that it is to be used as an olefin for plastic production(2).

In summer 2017 NWIW sponsored an industry conference called "Sowing the Seeds of a Cleaner Future"(3) that focused on the prospects of using methanol as a liquid fuel, even going so far as calling it 'Liquid Sunshine'(4). The conference reading materials do not even mention plastic production.

Wu Lebin, the chairman of C.A.S. Holdings, has repeatedly said the end use of the methanol is for fuel including to Reuters in December 2017(5)(6) admitting a goal of the company is to "drive use of methanol as a transportation fuel for cars and ships." More recently, for an International Capital Conference last November(7), Mr. Lebin's bio says that NWIW will use the ULE process to convert North American gas to methanol to provide China with fuel.

It is avidly clear that with this amendment the Port is trying to sidestep the shorelines process, limit the scope of the cradle-to-grave GHG emissions in the FEIS, and mislead the public and state regulators. They are building this huge fracked-gas-to-methanol refinery, they've marketed the methanol as a fuel source, and now they are asking us to believe the methanol will never be burned. And note if it is burned as fuel, according to their own FSEIS (Appendix B, page 50), that would add an additional 5.44 million tons of carbon pollution annually. This dock use "promise" cannot substitute for the legal requirements of a full true SEPA analysis of GHG emissions including from burning NWIW's methanol as fuel. We are counting on Ecology for holding true to that science, not the speculation described in the DSSEIS.

Don't get me wrong. I vehemently oppose this project no matter the end use of the methanol because methane gas is too environmentally damaging, and our state should and can be a model to the nation in moving to clean renewable energies immediately. But NWIW and the Port of Kalama are trying to have it both ways, while lying to the public, state regulatory agencies, and the Dept. of Ecology.

DENY the shorelines permits.

Bill Adams

Please reject this project. Despite what the proponents claim, it's a dirty project and will do nothing to combat global warming. It's estimated that it would emit 4.6 million tons of carbon pollution per year. That's a lot of dirty air and it would only exacerbate global warming. In May, 2017 I was diagnosed with broncheostasis. It's an incurable lung disease. My lungs are honeycombed. While there's no cure for it it's not necessarily fatal as it can be managed. But, manage means I need to breathe clean air. And, there are many others out there like me that have respiratory problems and need clean air. While I live outside of Cowlitz County, air pollution does not respect geographical boundaries. With combating global warming in mind as well as considering people like me, please deny the project. Thank you, Bill Adams

eileen johnson

No kalama methanol refinery. It is an environmental disaster in the making that would poison the Columbia river and further polute the pacific NW air.

Mark Keely

There is uncertainty to rely on a narrow set of bottom up estimates for methane leakage rates while leaving out top down leakage rates. It is suspect to have one and not the other. Considering the multiple locations and long distances from the wells through the pipelines to its final destination top down observations should be included in evaluating methane leakage rates because they are more comprehensive with sensors that capture the full range of operating conditions at gas extraction fields and pipelines. To leave out top down observations would be the practice of dubious legality. Regarding DSSEIS page 42, Alvarez found good agreement that a combined estimate for methane emissions to be 60% higher than US EPA emission inventory estimate.

RAYNA HOLTZ

Comment on the Second Supplemental EIS for the Proposed NWIW Kalama Methanol Plant rev. Oct. 8, 2020 ♦ from Rayna Holtz

My comments fall into two categories. First I look at the issue of greenhouse gas emissions that this study so wonderfully examined with considerable care and research, to see the greenhouse gas emissions results of various scenarios depending on whether the Kalama Manufacturing and Marine Export Facility (KMMEF) is built, versus results if it is not built. Second, I look at the context for this study, and for the Washington State governor's and legislature's 2020 progress on charting an effective path to comply with guidelines framed by the world's experts, the Intergovernmental Panel on Climate Change (IPCC). In both cases, I look at not only market forces, but at forces increasingly being mustered to counter market pressures with regulations and incentives that prioritize environmental health and the long term survival of human and other species over market trends driven by profit incentives.

A. The depth and breadth of this SSEIS is impressive, as is the broad range of possibilities it must contend with. However, it suffers from errors, omissions, assumptions.

1. One unknown is how the methanol will be used. We do know that Northwest Innovation Works (NWIW), which is Chinese backed, told the Port of Kalama that the Kalama plant would primarily sell its methanol to markets for olefins in Asia, but when presenting the project to potential funders it emphasized profits from selling the methanol for use as fuel. This behavior does not inspire confidence, but does warn that NWIW will manipulate to achieve a for-profit goal rather than speak out of a confirmed set of ethical guidelines incorporated into the operations of its business. (Why then should we assume that NWIW will follow through with its promised voluntary mitigation plan?)

2. To account for the uncertainty about intended uses, the range of models in the SSEIS includes both use as fuel and MTO (methanol to olefins), but looking at Fig 3.5.3 on p.65 we see that the Chinese use of methanol for fuel quintupled from 2006 to 2016 and it continues to rise. Isn't it likely then that the use of fuel will overtake the use for olefins? Beyond this example the number and combination of variables far exceeds the capability of meaningful modeling. While we do not know precisely what the methanol will be used for, we do know that it will add GHGs to our overtaxed atmosphere starting in just a couple of years and continuing for 40 years (the projected life of the plant), including the next two decades when we it is critical that we reduce GHGs. What is not burned as fuel, will become a problem to the environment when it is discarded, since the uses for products derived from olefins do not break down and return to the soil, so they will present other problems.

3. It is simplistic to want to partially justify the permitting of a facility that uses fossil fuels, emits GHGs in bringing its raw materials to its site, emits more in producing its product, and still more while conveying its product to Asia merely because it produces just slightly fewer emissions than other producers of its product!!

4. This report is based on outdated science. It uses IPCC4 100-year GWP values to calculate CO₂e, despite the fact that the IPCC subsequently updated them to more accurately reflect the

significantly enormous GWP of methane in its first 20 years. On p. 90 this report even acknowledges that: "GWP values are periodically updated to reflect current science regarding the energy properties of GHGs and their lifetimes in the atmosphere." Thus the report should have used the most accurate and current GWP values, which are found in the IPCC's fifth Assessment Report's 20-year GWP. The reason given by the authors for using the IPCC4 100-year GWP is that they are "the most commonly used GWP values," meaning they have been around longest?! This error biases all the results apparently deliberately so as to minimize the GWP of all the methane emissions. It doesn't matter what the annual GWP will be, averaged over the next 100 years! It matters tremendously what it is going to be annually between now and 2040!!

5. The calculations of upstream emissions are not well presented in this report, but seem to minimize the problem of methane escape at extraction sites, where gas is fracked. Researcher Robert Howarth notes that "scientists have measured big increases in the amount of methane, the powerful global warming gas, entering the atmosphere over the last decade." The evidence: "The chemical signature of methane released from fracking is found in the atmosphere, pointing to shale gas operations as the culprit." Howarth points to the fact that methane is most active in its first 20 years as having rapid rewards for curtailing its emissions: "Carbon dioxide emitted today will influence the climate for centuries to come, as the climate responds slowly to decreasing amounts of the gas. Unlike its slow response to carbon dioxide, the atmosphere responds quickly to changes in methane emissions. Reducing methane now can provide an instant way to slow global warming and meet the United Nations' target of keeping the planet well below a 2-degree Celsius average rise," Howarth said. (Robert Howarth, ecologist at Cornell University and author of the study published Aug 14 in the journal *Biogeosciences*.)

6. The problem of emissions from pipeline leaks all along the way is not mentioned. Pipelines are made of lengths of pipe connected. Over time, joints fail, as surrounding earth is disturbed by a variety of impacts, including earthquakes. Not only does this likelihood add to our burden of greenhouse gases, it adds threats to the health and safety of communities and ecosystems due to contamination and fire hazard. (I well remember my daughter's story when she was a Western Washington University student of a local incident: "On June 10, 1999, a gasoline pipeline operated by Olympic Pipeline Company exploded in Bellingham, at Whatcom Falls Park." - Wikipedia)

7. As the Department of Ecology News Release of Sept. 2 states, "The project would increase greenhouse gas emissions within Washington State by almost one million metric tons of carbon dioxide equivalent a year." And because the report uses the AR4 100-year GWP (see point 4 above) this under-reports the CO₂e for whatever portion of this happens to be methane, so we need to multiply that figure by 86. Not helpful, especially when our Washington legislature's 2009 goal, which was to bring our emissions down to 1990 levels by the end of 2020, has already failed completely, and instead our emissions have increased by about 8 percent!!! What part of NO MORE EMISSIONS do we not understand?

8. This report does not consider the possibility that yet cleaner processes may soon make the Kalama technology with its "ultra-low emissions" obsolete.

*One possibility is producing methanol from the carbon dioxide in the atmosphere! An example: "Carbon dioxide-to-methanol process improved by catalyst," *Science Daily*, June 28, 2018, Penn State.

*Another: "Harnessing light for a solar-powered chemical industry," by Associate Professor Daniel Gomez, Royal Melbourne Institute of Technology, published in *ACS Applied Energy Materials*, Jan. 30, 2019. In this second article Dr. Gomez states: "Chemical manufacturing is a power hungry industry because traditional catalytic

processes require intensive heating and pressure to drive reactions." And, "The photo catalyst we've developed can catch 99% of light across the spectrum, and 100% of specific colours. It's scaleable and efficient technology that opens new opportunities for the use of solar power moving from electricity generation to directly converting solar energy into valuable chemicals."

9. There is no mitigation that can adequately compensate for adding GHGs to earth's atmosphere at this time in history. Is it OK to add just a little oxygen to a raging house fire?

B. The context for this permitting process is not average. This is a precedent-setting moment, when every person and every life form on the planet is facing a crisis with a magnitude as great as the one that destroyed the dinosaurs. We simply cannot behave as though it's business as usual, and the best-written set of justifications and excuses wins a work-around to avoid the rules.

1. RCW70A says, under Intent 2020 c 79: "(3) The longer we delay in taking definitive action to reduce greenhouse gas emissions, the greater the threat posed by climate change to current and future generations, and the more costly it will be to protect and maintain our communities against the impacts of climate change. Unchecked, climate change will bring ever more drastic decline to the health and prosperity of future generations, particularly for the most vulnerable communities."

A new methanol plant in Washington would hinder the difficult task that is so urgent right now: to turn our GHG emissions around. With every passing month, more damage is done because of the effects of climate change, and some of the processes unleashed by global warming are actually accelerating its damage and speed (for example: the thawing of tundra is releasing additional methane that had been sequestered in the frozen tundra!) Climate change is increasing in momentum, so that some damages we can still hope to avert by reducing GHGs this year, will become inevitable if we wait to act until next year.

2. Until recently the United States has enjoyed one of the most stable democracies in the world, with time-honored institutions that enabled us to have the rule of law to protect our human rights and welfare. But we have not shouldered the responsibilities that come with our extensive privileges and wealth. According to the Center for Climate and Energy Solutions, the United States leads the world in Per Capita Greenhouse Gas Emissions, with over 18 tons of CO2 equivalent per person in 2017. Russia follows with a bit more than 15, then Japan with a bit less than 10, and the European Union is at about 8. The U.S. is responsible for 25% of the cumulative emissions of GHGs from 1751-2017, followed by the EU at about 22%. It's high time to step up. No simple for-profit venture, the possibility of initiating a successful new corporate enterprise, can take priority over this existential necessity.

3. Department of Ecology's Perry Lund states in his letter of October 9, 2019, to Dr. E. Elaine Placido, Cowlitz County, that "By law, Ecology must review all CUPs for compliance with the following: 1) The Shoreline Management Act (RCW 90.58)." Looking, therefore, at RCW 90.58.020, in "Legislative findings State policy enunciated Use preference", we find that the third paragraph lists "seven uses of state shorelines to guide the development of master programs for shorelines, "in the following order of preference which: (1) Recognize and protect the statewide interest over local interest; (2) Preserve the natural character of the shoreline; (3) Result in long term over short term benefit; (4) Protect the resources and ecology of the shoreline. . ."

Although a Kalama methanol plant may bring jobs and an economic boost to the local folks, the

broader statewide interest will be better served with less GHGs and a healthier shoreline. The long term benefit will be much better served by NOT siting an enormous methanol plant where it can jeopardize "the resources and ecology of the shoreline."

This shoreline is part of the magnificent Columbia River estuary, whose health and water quality affect large communities of marine life both locally and downstream, extending to shorelines north and south along the Washington and Oregon coasts. Further, this ecosystem lies at a critical bottleneck for a majority of Washington's vital salmon runs, which travel from the Pacific Ocean back up the Columbia to numerous feeder rivers draining both the eastern Cascades and the western Rockies, spanning all of eastern Washington and part of British Columbia. These waters must be protected for the sake of innumerable beleaguered salmon stocks that have already been decimated by dams and premature melting of snowpack causing excessive warming of spawning streams that consequently cannot hold adequate oxygen to keep spawning salmon alive. On these salmon runs depend not only fisheries that have supported indigenous fishermen since time immemorial, and more recent commercial and recreational fisheries, but also the iconic Southern Resident Killer Whales of Puget Sound, now unable to find sufficient forage year-round to sustain healthy reproductive adults. It is unwise to allow any more dangers to further transform one of their key habitats into a gauntlet beset with hazards. (Further detail: see "Policy on Coastal Liquefied Natural Gas Facilities," attached.)

RCW 90.58.020 also states, "Uses shall be preferred which are consistent with control of pollution and prevention of damage to the natural environment, or are unique to or dependent upon use of the state's shoreline." There is no industrial plant that is immune to accidents. The siting of a large methanol facility in such a sensitive shoreline with the potential to cause lethal harm to so many already struggling species with both extremely high economic value and incomparable iconic northwest significance poses unacceptable risks of the sort this law warns against.

In summary, the backdrop of climate change against which this methanol plant is proposed dwarfs all other considerations with its multiple threats and exigencies. We must look at this decision with eyes wide open, and make a decision that will help slow the unraveling of the planetary systems on which biological life depends. Deny the conditional use permit.

Sincerely,
Rayna Holtz

POLICY ON COASTAL LIQUEFIED NATURAL GAS FACILITIES

Approved by the Surfrider Foundation Board of Directors on February 6, 2010

Whereas, the Surfrider Foundation advocates for the conservation of coastal and ocean resources and the use of renewable energy sources over fossil fuels;

Whereas, recent reports suggest that domestic supplies of natural gas are growing and there is nearly a century's worth of production at current rates;

Whereas, energy interests are proposing and applying for licenses to build thirty new liquefied natural gas (LNG) port terminals in U.S. waters;

Whereas, all of the proposed LNG port terminals and 75% of the approved LNG port terminals are designed for exporting U.S. sourced LNG;

Whereas, energy industry outlooks project that the U.S. will become the second largest LNG exporter in the world (after Australia);

Whereas, new coastal LNG terminals require infrastructure development that creates upland environmental impacts that adversely affect coastal resources, including shoreline alteration, coastal erosion, and water quality impairment.

Whereas, the processing and shipment of LNG produces greenhouse gas (GHG) emissions that are much greater than domestic natural gas;

Whereas, the process of turning natural gas into LNG is highly energy intensive, and in total, LNG is estimated to be the largest source of GHG emissions growth from the oil and gas industry by 2025;

Whereas, the drilling and extraction of natural gas results in large amounts of fugitive emissions of the world's most potent GHG, methane, which has 84 times the global warming potential of carbon dioxide in the short term;

Whereas, the Surfrider Foundation, through its Policy on Climate Change, has recognized climate change is a scientific reality that will include dangerous changes in the characteristics of the ocean including warmer waters, higher acidity, rising sea levels and increased storm severity that threaten coastal communities, beaches, and coastal and ocean ecosystems;

Whereas, Surfrider Foundation has resolved to support efforts to reduce carbon and other GHG emissions;

Whereas, the known and anticipated environmental impacts of LNG facility development and operation include marine life mortality associated with continuous water uptake; discharge of both cold and chlorinated water to marine environment; air quality degradation, including carbon dioxide emissions; high energy consumption

rate; introduction of invasive species, including those discharged in ballast water; benthic habitat disturbed in mooring and transmission pipeline installations; and light pollution;

Whereas, the unknown environmental impacts of coastal LNG facility development and operation present significant risks to the marine environment that are difficult, if not impossible, to adequately address through adaptive management protocols under existing regulatory authorities;

Whereas, the siting of LNG facilities and related infrastructure is an applicant-driven process that requires regulatory agencies to conduct environmental review and consider input from affected communities and the public.

This policy is general in nature; the Surfrider Foundation recognizes that every specific case must be evaluated in the context of the local setting.

NOW, THEREFORE, BE IT RESOLVED that the Surfrider Foundation Board of Directors finds:

Coastal community members, the general public, local businesses, and recreational ocean users, including beachgoers and surfers, are affected by the development of LNG facilities and associated infrastructure, and are key stakeholders in local, regional and national project proposals.

LNG facilities, due to their consumption of finite natural resources, generation of GHG emissions, and other harmful effects on the environment, are not a viable means of providing safe and sustainable energy. Given the availability of alternative renewable energy resources, LNG facilities are not consistent with successful overall strategies for addressing climate change.

Given the impacts to coastal and ocean ecosystems, air quality, including increased greenhouse gases, and coastal access, the Surfrider Foundation finds that siting LNG facilities in the coastal zone is not consistent with successful protection, conservation and access to coastal resources.

Washington State Department of Ecology
Olympia, Washington

Re: Formal Comments on Kalama Manufacturing and Marine Export Facility Draft Second Supplemental Environmental Impact Statement, September 2020

Please deny Kalama Manufacturing and Marine Export Facility (KMMEF) a shoreline substantial development and a conditional use permit. The environmental impacts from the project are significant and cannot be mitigated.

Why does this SSEIS devote about two-thirds of the intended greenhouse gas analysis on an economic study, and poorly done at that?

"Economic Analysis: A market-based evaluation was conducted to assess whether methanol produced by the project would substitute for or replace other sources of methanol, rather than supplement them." SSEIS p. 38

According to Washington law and Department of Ecology website the purpose of SEPA and environmental impact statements is to identify and analyze environmental impacts. This begs the question why more consideration was not given to identified GHG emissions. Fugitive and transportation emissions from a long pipeline route are not analyzed. Emissions from operation of the KMMEF marine dock are ignored. There is no substantiation of low emission claims from the ULE process itself, despite the ULE process being untested on a huge industrial scale and results from the Coogee ULE facility contradicting such low emission claims.

Yet this SSEIS goes into mind boggling detail, or perhaps obfuscation, to guess what methanol markets will look like in forty years to support a result intended to make Kalama methanol look like the cleanest and most competitive methanol on the planet.

The most obvious economic question might be, if NWIW's ULE methanol process is so wonderful then why aren't other methanol producers replicating it? Especially the big players in the market, like Methanex? After all, the technology has been around for more than twenty years. If no one else is using it, the logical course would be to find out why not? Could it be the most forward-thinking methanol producers are moving to LCM, low carbon methanol, and fossil free renewable gas feedstock?

Why does the economic analysis not mention NWIW's parent company GTM's intentions to produce methanol in British Columbia, closer to gas feedstock producers?

Financial advisors have a fiduciary responsibility to advise that past performance is no indication of future returns when it comes to investment risk. Yet this SSEIS seems to have no doubt about the reliability of their future assumptions in drawing a conclusion.

Indeed, there is not even past performance when it comes to Northwest Innovation Works. It is a paper LLC created in January 2014 to pursue a speculative venture. A major investor, British Petroleum, pulled out within a year after the price of oil dropped precipitously making the economic viability of the venture too risky. The principals have no credible background in petrochemicals. President Vee Godley was previously involved in the failed Hoku silicon plant in Idaho.

While supporters complain vociferously about the lengthy permit process, NWIW has never produced complete financial and facility plans. They have claimed much, yet never revealed the project would be the world's largest methanol refinery. One would think this might be a selling point for a worthy project.

The original idea was to use the CR process and not more than 36 MW demand from the power grid. This got changed when they realized the air pollution controls from burning so much natural gas for power generation was too costly.

Then there was the issue of wastewater disposal and impingement on shorelines and wetlands.

When they were caught hawking the project to investors as producing methanol for fuel instead of the stated purpose as plastic feedstock, they needed another port lease amendment.

NWIW was promoted as producing taxes and jobs. Yet the port agreement only requires 80 permanent jobs, less than one job per acre of waterfront industrial property. NWIW has lobbied the legislature for tax benefits. The project has applied numerous times for federal tax dollars to build the dock. It has applied for a two-billion-dollar federal loan to build the refinery.

The tax benefits and two billion loan should be considered in the SSEIS economic analysis considering the implications such subsidies might have on relationships with global trading partners, if the state subsidies to Boeing are any indication.

After more than six years of experience with Northwest Innovation Works, please heave this project overboard. It is a risky financial investment and a sure route to environmental and climate degradation.

Thank you,

Diane L. Dick

No Kalama Methanol refinery. this project would cause a huge amount of climate pollution

Kathy Boylan

No to Kalama methanol refinery. In these dire times it is time to stop listening to the petro chemical industry spin and consider the human and environmental costs of this highly toxic project.
ENOUGH

Sally Keely

KMMEF is a 3-part project: the lateral pipeline, the dock, and the refinery itself. They are all tied together. One is not able to operate without the other two. Either all three should be permitted or NONE should be permitted. (I favour the latter!) The pipeline aspect of the proposed Kalama project remains highly controversial. The people of Kalama and Cowlitz County do not support the use of eminent domain for exporting gas in the form of methanol. The 3.1-mile lateral pipeline is for corporate gain and serves no public purpose. This issue bridges traditional political divides in Kalama. Families have had their homes and land held hostage by the threat of eminent domain for years, and now 2 more with the recent FERC rubber-stamped extension decision. My own home is ¼ mile from the Williams north-south pipeline and I can't imagine the uncertainty they must be feeling. STOP Kalama methanol refinery. DENY the shorelines permits. Let homeowners along the lateral pipeline route get their property, and sanity, restored.

Richard Voget

The SSEIS shows clearly that the facility would generate around 4.6 million tons of carbon dioxide pollution each year, equivalent to around 5 percent of the state's total climate emissions. This much is clearly established and irrefutable. The mission of the department of Ecology should be to oversee the reduction of greenhouse gases, and not declare a project as acceptable because it is less dirty than an alternative. The most recent international and global assessments show that if greenhouse gases continue to increase at the current rate, global temperatures are likely to reach 1.5 degrees Celsius above pre-industrial levels by as early as 2030. The SSEIS states that only emissions from Washington State will be mitigated. And mitigation can be spread over years past 2030. Between the unmitigated emissions from China and British Columbia as well as the unmitigated emissions that haven't had their turn to be decarbonized, this project will be increasing global warming at a time when the window to avert a climate crisis is closing.

The entire premise of the Kalama project is establishing 40 more years of consumer demand for gas rather than moving away from fossil fuels. How can you confidently predict consumer demand for the next 40 years? Coal production has crashed as the price of natural gas became cheaper due to fracking. I have included the Chart of the Week from the April 2019 World Economic Outlook that shows prices dropped 76 percent for solar panels and 34 percent for turbines between 2009 and 2017 making them competitive alternatives to fossil fuels and more traditional low-carbon energy sources such as hydropower and nuclear. Renewable energy generated electricity will become cheaper than methanol and all the other fossil fuels in the not too distant future and well within the 40-year premise of the SSEIS. The price of methanol will not remain constant as predicted in the report. The Kalama refinery will eventually close as methanol becomes noncompetitive. Please do not approve this project that will contribute to global warming until it closes due to market economics that were not evaluated in the report.

Cheaper power

Rapidly falling costs are fueling investment in solar panels and wind turbines for electric power generation.

(levelized cost of electricity, US dollars per megawatt hour)

Note: Levelized cost of electricity data has been deflated using GDP deflator and does not include subsidies and taxes.

INTERNATIONAL MONETARY FUND

Thomas Gordon

NWIW plans to use part or all of the methanol it hopes to produce as fuel in China. However, most of China's power comes from coal-fired plants now.

As reported in Carbon Brief, March 24, 2020, China, with more than half of its coal-power firms losing money and with the usual plant running at less than 50% of capacity, why is the Kalama methanol refinery being planned?

"Looking at the energy situation shows the China's network operator, State Grid, and the industry body, the China Electricity Council, are pushing for hundreds of new coal-powered power plants to be built. "And a recent update to the "traffic light system" for new coal-power construction signaled further relaxation of permitting." Even now, China, the world's largest emitter, who overtook the EU in 2003 and the US in 2005, is putting out nearly a quarter of global greenhouse emissions. Also, China is pushing ahead on renewables. The result is over-capacity, built on purpose. China is working to keep its options as open as possible in the future.

China's "economic miracle" has seen the country become the world's second-largest economy and pulled nearly a billion people out of poverty. But this progress has been built on a boom in energy from coal, meaning China has also become the world's largest carbon polluter by far.

China's CO₂ emissions increased again by around 2% in 2019, based on recently released official economic data, and 65% of the annual growth in energy consumption came from fossil fuels.

Coal is the most carbon-intensive fossil fuel and still accounted for 57.7% of China's energy use in 2019, the data shows. Coal plants, which burn approximately 54% of all coal used in the country, provide 52% of generating capacity and 66% of electricity output — down from a peak of 81% in 2007.

Coal-fired power capacity grew by around 40 gigawatts (GW) in 2019, a 4% increase, and a pick-up from the past two years. As a result, the coal fleet's average utilization rate fell further, to below 50% on average.

Against this backdrop, there is already heated debate — as outlined below — over China's 14th FYP, (five year plan), which will set national targets and priorities for the next five years. The energy targets that will be set by the plan — mean it will be a crucial document for global efforts to tackle climate change.

Under the existing 13th FYP, coal power capacity is capped at 1,100GW. Separate targets aim to raise the share of China's energy mix that comes from non-fossil sources to 15% by 2020. More detailed development plans set out indicative targets for sectors such as renewable energy. (Solar has significantly exceeded the relatively low indicative target that was set five years ago.)

Targets of a similar nature are likely to be set as part of the overarching 14th FYP, due to be agreed on early next year. Further details will then be set out in sectoral plans over the following year. The power-sector plan, which could include targets for the growth of most generation options — but particularly renewables — might be expected during winter 2021-22, based on previous cycles.

The stakeholder consultancy, scoping and drafting for the power-sector plan has already been started within the government system, with different academic organizations and think tanks tasked with producing research to support the process.

China's coal-power overcapacity dates back to the 12th FYP. This was formulated in the early 2010s as part of the largest economic stimulus programme in history, launched in response to the

global financial crisis. It targeted a huge expansion in coal mining and coal-fired power generation. Then, from 2014, the authority to approve new coal-fired power plants was transferred from the central government to the provincial level, in a drive to cut red tape.

Many local governments jumped at the opportunity to prop up GDP and create demand for locally mined coal with new power projects, leading to around 210 projects with a total capacity of 169GW being rubber-stamped in less than a year.

This surge of new projects came as demand for coal-fired electricity declined from 2013-2015, apparently catching the central government by surprise. It then moved to curtail approvals and suspend already permitted projects.

China's economic system is based on abundant and cheap capital being made available to the state-owned sector with little concern for economic viability, as long as the investments made are broadly aligned with the five-year plans.

This system can mobilize vast amounts of resources, but is prone to over-investment, as companies and local governments use capacity expansion to boost GDP and gain market share. The planning machinery limits overcapacity with control policies with varying levels of success.

Many experts and industry bodies argue for a move away from top-down targets and controls, to investment driven by market forces. However, the spending needed to fuel a new stimulus program can only be mobilized if investment is directed at the behest of the state, rather than the market. As a rule, China does not fund stimulus with on-budget spending, but by directing state-owned enterprises and commercial banks to spend more. In these circumstances, lack of controls on capacity additions runs a high risk of over-investment.

For example, efforts to control overcapacity might be vulnerable to the political priority of boosting investment spending to reach economic targets. An indication of this was the loosening of "traffic lights" for new coal-plant approvals, published by the National Energy Administration in February. The traffic light policy was first introduced in January 2017 to prevent provinces with overcapacity from permitting new projects. A year ago, however, 21 of China's 31 provincial grids included in the policy were given a "green light". Last month this increased to 25."

Thus, there is no pressing incentive to build methanol-burning plants. However, one incentive is to use resources outside China in order to save internal resources.

There is no reason for us to build this plant just as a hedge against the future for China. The result for us is destroyed land and forests to get at the gas by fracking in Canada and the US. Leakage of methane will increase as more methane is pushed to Kalama through aging gas lines, some 50 to 60 years old, the projected life times of some of these lines.

Plus, our electricity will be used to refine the methane into methanol through electric lines that created pollution in their manufacture and placement. The refining of methanol itself creates millions of tons of pollution. Lastly, transporting the methanol down the Columbia River and across the Pacific to China will create more pollution.

If this refinery is not built, all these green house gases won't be created either.

Please do not issue the permits for this refinery.

Thomas Gordon

If this refinery is not built, all these green house gases won't be created either.

Please do not issue the permits for this refinery.

Ellen Mickle

Dear Washington Department of Ecology,

I strongly urge you to deny the Kalama methanol refinery project since, based on your own draft analysis, it would be a major polluter. It would use more fracked gas than all of Washington's gas plants combined. In May 2019 Washington became the fifth state to commit to 100% clean energy by 2045. Since the passage of this legislation signals a desire by Washingtonians to curb climate-chaos driving pollution, rather than a preference for how the electrons running into their homes are produced, I urge you to deny this project. In 2019 it was also revealed that Northwest Innovation Works had been misleading the public and regulators by claiming the methanol would be a cleaner source for plastics, when in reality, as OPB reported, they lured investors for "an opportunity to buy into a new methanol supply chain to fill China's insatiable appetite for fuel." I'm not apprised of what ethics fossil fuel project firms operate by, but in the field of planning, which I just started grad school for, one of the ethics by which we operate is to "not misrepresent facts or distort information for the purpose of achieving a desired outcome." After this came to light, Port of Kalama commissioners unanimously passed a lease amendment that prohibited the firm from exporting its product for fuel. The very community is against the intent of this project, and we simply don't have the environmental budget to support this opportunity for private industry to generate massive amounts of wealth, so please deny.

Carolyn Fox

I am opposed to the proposed Kalama methanol refinery. It will be a huge emitter of greenhouse gases and it won't stop anyone from continuing to mine coal and burn it. It will be a 'net addition' of greenhouse gases to the planet. Please do not issue a permit for this project.

Thank you.

Carole Eby

I implore you to reject the request for shoreline conditional use permits for the Kalama Methanol refinery. The SSEIS states that it "would increase greenhouse gases in Washington, but could substitute for dirtier sources of methanol globally". The operative words here are "would" which is a certainty, and "could" which is speculative. Could relies on a hope that the Chinese might take a coal feedstock plant off line, stop building more coal to methanol plants, not burn the methanol as fuel, not sell off the equipment from a shuttered plant to a third world nation, and the list goes on.

My husband and I bought property 6 miles south of the proposed methanol plant in January 1972. As friends and family helped us build this home the siren to warn us to flee a disaster at the Trojan Nuclear facility was being erected a few yards from our driveway. Kalama Chemical emits a stench that gives us nausea and headaches. We think of the spent fuel rods stored at Trojan. This is the legacy my children and grandchildren inherit. Please do not add this massive GHG polluter with speculative benefits.

I also call your attention to the issue of mitigating the alarming volume of greenhouse gases this plant will spew into the air we breathe. In an interview with the Daily News, Mr. V. Godley, speaking for NWIW expressed pleasure over being able to mitigate entirely in the State of Washington. Yet we know full well that the SSEIS says if the emission reduction obligation cannot be met with local or regional projects "the board will look to purchasing credits through established national or international carbon markets". Furthermore if the cost of those hypothetical local or regional mitigation projects can't be covered in the budget "then the reduction obligation is achieved with the purchase of carbon credits". The public has been fooled into thinking that full mitigation means all those greenhouse gases are being magically neutralized locally. Perhaps there's a bird refuge, nature path, or an acre of sapling trees in Kalama's future? You know this is intended to lull people into complacency.

Though not directly related to your request for comment on the GHG and mitigation issues, I wish to note the disingenuous nature of NWIW when it comes to the highly touted subject of 200 highly paid jobs. We have seen the lease agreement between the Port of Kalama and NWIW. They agreed that the requirements of the lease could be met with as few as 80 employees, and if circumstances dictated, NWIW has the option to negotiate with the Port for an even lower work force. We are tired of this spectacle of smoke and mirrors.

Climate change is real. This refinery doesn't belong in Kalama or anywhere else. Deny the permits. Speak to the best interests of people. Urge the Port of Kalama to focus on clean energy projects. Even when a project has hung about in the wings forever there is still time to say "no". Thank you for protecting our air and water, and our future.

Sincerely,
Carole Eby
1010 Martin's Bluff
Kalama, WA 98625

Charlotte Linton

My name is Charlotte Linton. I live in Seattle. I'm here today to ask the Department of Ecology to reject this project. As a mother of a two-year-old daughter, I'm extremely concerned about the impacts of climate change in our planet and our future. Just last week, we only had to look out our windows to see the effects with small blankets in our entire region. I had to explain to an outdoorsy toddler that she couldn't leave the house and that simply breathing the air could be harmful. I know that increased wildfire activity is just one of the many ways that climate change is harming our region, and like many of us, I'm wondering how many more things have to be explaining to the young people in our lives. This refining would produce an exorbitant amount of greenhouse gases, which we know will contribute to global climate change.

You mentioned in the analysis that the emissions for methanol production will be higher if the Kalama facility is not built, but this is purely speculation. In a changing world, it's impossible to predict the demand for methanol and over the next 40 years. Rather than trying to guess how methanol may be produced elsewhere, we should concentrate on what's happening in our own state. This level of pollution is totally inconsistent with Washington's climate goals. We need to be leading the way in the transition to a clean energy future, not investing more fossil fuel infrastructure.

The environmental impact statement mentions that Northwest Innovation Works intends to fully mitigate the impacts of the project. However, this will be accomplished through a voluntary mitigation framework for which there are very sparse details. With no plans for specific projects or measures they intend to take, how are you going to hold them accountable? With so much at stake for our communities and our environment, we cannot simply trust that this corporation will be true to their word. If we wanted to >> curb the effects of climate change, we need to start with our own state and our own communities. By rejecting this project, the Department of Ecology has the power to make a huge, positive impact for the next generation of Washingtonians, help us to protect, preserve, and enhance our environment. Thank you for your time.

Neal Anderson

I've heard several people make the argument that we should build this because it would be better for the climate, but if we don't build a massively polluting refinery here, someone else might build one that's even worse. It seems like a pretty weak argument anyway, but it completely ignores where we are in the climate crisis. It's way too late now for incremental improvements. Scientists are saying that to avoid catastrophic tipping points and widespread species extinction, our only hope is to rapidly decarbonize over the next few decades, shutting down existing fossil fuel refineries and eliminating all sources of climate pollution within 30 years.

Now, we're talking about building a brand new one with a 40-year lifespan, which means we're already planning to fail. Going forward with this project means giving up on trying to secure a livable future for our children. It means telling the next generation that they'll have to live with ever-worsening disasters because we lack the imagination to do anything other than build more fossil fuel refineries, and try to convince ourselves we're making improvements. It means telling them that we valued our short term economic interests over their futures.

Making a huge investment in a new fossil fuel project at this point would mean we've given up and accepted that we won't solve climate change in time, and so we've decided that we may as well profit from it. But we can do better than that. We can reject the fossil fuel industries of the past and start building a truly clean future in Washington. Thank you.

Cathryn Chudy

Ecology did the right thing when expecting NWIW to provide accurate and truthful answers to relevant questions on the proposed facility. The current SSEIS release on September 2nd became necessary when your persistence met the stonewall of a company that is long on promises, and short on reliable answers when it comes to being honest with regulators and the public. The original proposal for a facility twice the size of Kalama to be built and operated in Tacoma, stalled in part back in 2016 over failure of the same company to answer basic health and public safety questions posed by the public and the port commissioners at Tacoma.

A replay of this failure by this company to truthfully factually and adequately answer questions about the proposed facility and Kalama, has, once again, forced you to pursue substantive answers to relevant questions on your own. What you did establish with the second EIS is that upstream, onsite, and downstream emissions will result in an increase, not a decrease and not a removal of climate pollution here in Washington. When the Hail Mary that proponents are grasping in order to make their dubious case with the ecology, involves a diversion from reality by taking us down the yellow brick road to the Oz of speculation and if then, thinking that somehow has been converted into a case for environmental game where there literally factually is not.

Voluntary mitigation may sound reassuring to some, but add on the phrase when feasible, and to the extent, possible, and you have an empty promise that more than likely will disappear into thin air as the profits are pocketed outside of Washington, and our children and grandchildren inherit the climate pollution mess that cannot be wished or mitigated away so easily. You are the guardians of our air, land, and water. You cannot sign off on this proposal masquerading as a climate solution without betraying the trust we and those who come after us, place in you. We urge you to deny the permit and reject this project. Thank you.

Joyce Follingstad

I am Joyce Follingstad, a Psychologist Nurse, a kayaker from Portland, Oregon, who cares about keeping our rivers clean, keeping our climate from heating up further, and keeping our air and environment pristine for our children and all the citizens of the world. I reject this proposed Kalama Refinery, which is to turn frac gas into methanol. First, because the frac gas process is causing numerous waterways and underground water wells to be contaminated. Also, the fracking process causes leakage of methane gas, further increasing global warming, and the transmission of frac gas to Kalama would endanger the citizens of Southwest Washington of the Scenic Columbia River Gorge, and up Northern Oregon through gas leaks and deadly explosions and fires.

I reject this refinery because it would create millions of tons of greenhouse gas pollution for its projected 40 years of refining, which will only increase the climate catastrophe that we are already experiencing. I reject this refinery because the methanol that this burned overseas as fuel will come back to us and to Asian citizens in the form of additional air pollution, an estimate of five million tons annually. This is not compatible with the healthy air needed by humans, flora, and fauna. Please do not build this refinery as it does nothing to further the goal of renewable non-polluting energy for the future. That is where we need to place our investments so we can prevent further speeding up of our one and only planet.

Nick Engelfried

>> Hi, my name is Nick. I live in Bethlehem, Washington. I oppose this methanol plant and fundamentally disagree with the logic of the model we saw during the presentation for calculating global lifecycle greenhouse emissions. We cannot simply assume that if this plant isn't built, an exactly equal amount of methanol will still be consumed and supplied from plants that would not have been built if this plant was permitted. That isn't how markets work, they respond to supply and demand. When supply of a dirty fuel goes up, it will displace clean energy and more people will consume it. Further, the world is undergoing an energy transition that will only be hampered by this plant.

Oil companies like Shell and BP are planning for a post-oil future. General Electric just announced it will no longer make coal plant parts. China is considering increasing its goals for renewable energy production, and it seems like that has potential to affect assumptions made in the EIS. We should focus not on emissions in China that we can't directly control, projections of wish are based on dubious assumptions about future energy markets and what the Chinese government will or will not do. We need to focus on our own carbon emissions here in Washington, which we can control in which the EIS shows will go up if this plant is built.

In the coming decades, the incentive for countries to move beyond fossil fuels will become even greater as we see increasing numbers of climate-related disasters, like the fires here on the West Coast and as governments respond. Is that reality being factored into the EIS? I don't see how it can be. Again, we should focus on what we can predict and control, which are carbon emissions here in Washington that will unequivocally go up if this plant is built. Thank you.

Cathryn Chudy

I listened carefully to all who spoke during three virtual hearings. I was dismayed to be told that in opposing this proposed facility I am putting feelings over facts and ignoring science, that I rely on plastics and am a hypocrite for asking our Dept. of Ecology to reject it on the basis of end uses that we all need, and that I am simply advocating to keep the status quo rather than "try something different."

Feelings are essential when combined with facts that clearly show how this proposal will harm rather than help us, both in the short run and especially in the decades to come.

I see through the selective "science" advocated by proponents, that intentionally misleads and misrepresents, in order to reach conclusions that will somehow justify a "YES" outcome. A stronger case has been made by many of us that the "science," when not "cherry-picked, along with basic common sense, compels the Department of Ecology (the guardian of our land, air and water) to do the right thing for Washington by saying "NO" to both the Shoreline Permit and the proposed facility.

Plastic and methanol for fuel are end uses that we as stewards of the future for our children and grandchildren should be steering away from, rather than embracing. We can and will find alternatives that won't cost the health, safety and quality of life for the next seven generations.

As for maintaining the status quo, the Kalama proposal actually represents continuing a toxic "status quo" that advocates "business as usual, aka pursuing obscene profits for the few over harm to the many. We are asking for trying something different - saying "no" to fossil fuel profits in light of doing no harm.

Finally, I would not think to tell a child faced with a bully in front of him to let that bully land a sucker punch on his left or right eye, simply because there probably is another meaner bully around the next corner who will do worse. We should not tolerate this kind of reasoning to justify this facility, and neither should the Department of Ecology.

I urge you to deny the Shorelines Permit and ultimately reject the facility itself.

As Henry David Thoreau said:

"The cost of a thing is the amount of what I will call life which is required to be exchanged for it, immediately or in the long run."

State Representative 20th District

>> I'm Ed Orcutt. I'm a State Representative here on the 20th district. I'm also a resident of the Kalama Community and live just a few miles from where this plant would be built. I'm giving testimony in favor of building the plant, and it's for many of the same reasons that we've heard people oppose the plant. We've heard that we can't mitigate, we can't reduce incrementally but I believe we have to reduce incrementally. I think any opportunity that we have to build a facility that will reduce the overall amount of carbon emissions that we're going to get, is something that we must be doing.

It's been mentioned about the catastrophic wildfires that we've had here. Those have released a huge amount of carbon into the atmosphere and what's even worse, is we've lost the carbon sequestration ability of those forests. That makes it all that much more important that we do these incremental steps to replace what has been lost. Not only is there more carbon in the atmosphere because of the fires, but it's no longer sequestering carbon.

I believe we need to do this to get the benefit in the time that it's going to take to get those forests recovered and sequestering the carbon that they've released, and other carbon it's going to take 40 years, 50 years for some of those, that's over 300 million tons of carbon that will not get sequestered if we do not build the plant. If we are in a climate emergency, we must be taking every step we can and doing it as soon as we can. To me, that says we need to build the plant and we need to build it as quickly as possible. Thank you

Markus Boos

Thank you. My name is Markus Boos. I'm a pediatrician and a scientist in King County. Simply put, I cannot speak strongly enough against the building of this refinery and I implore Washington State to deny the permit for its construction. Based on the department's analyses, this project would produce millions of tons of carbon pollution yearly, and not only does this run contrary to our state's climate goals, but the facility will also pollute water systems including the Columbia River, while devastating the surrounding ecosystems.

As a physician, I'd like to address the health effects that would result from construction of this refinery. What the environmental impact statement does not directly address are the indirect costs it will occur secondary to the refineries adverse effects on human health locally. In 2018, the Intergovernmental Panel on Climate Change released a detailed report summarizing the devastating effects of human-driven climate change secondary to the combustion of fossil fuels, and the release of greenhouse gases. These consequences include economic and health impacts in natural disasters, sea-level rise, and the effects of extreme heat on changing ecosystems that won't be unable to support human life. To mitigate these impacts, the IPCC demands that we reach and sustain net-zero greenhouse gas emissions. Fundamentally the permitting and building of this finery runs contrary to that goal and no amounts of greenwashed messaging about, "Carbon emissions savings" associated with this project can contradict that.

We are experiencing health effects of unabated greenhouse gas release today, and that will worsen only with time. That's from heatstroke, floods, wildfires, heat-sensitive infections are occurring in our backyards and worldwide. As a pediatrician, I recognize the local longitudinal health effects of pollution and climate change secondary to greenhouse gas emissions from refineries such as the one in question, which include a greater incidence and severity of atopic dermatitis, asthma, other respiratory illnesses, which are compounded by the wildfires we are experiencing.

I also witnessed firsthand the detrimental health effects and mental health effects as well. We know that all the consequences disproportionately affect children, and these enormous costs will ultimately fall on our woefully unprepared healthcare system and must be considered in any impact assessment. I reject the permit for this.

Caleb Ceravolo

My name is Caleb Ceravolo, I'm a 15-year-old from Ridgefield. The pipeline that is part of the committee today would pump frack gas to export to Northwest Innovations Work, a Chinese company. This pipeline would go through the land that will be seized through eminent domain against people's will, whether they want the pipeline or not. This pipeline brings down the property value, which is said to be made up and just compensation, but who determines what just compensation is?

The pipeline also leaks flammable greenhouse gas into the area, which the company might say won't happen, but there's a gas and you can't stop a gas from leaking in such a large project longterm. Also, the Trump administration brought down requirements from keeping these leaks from happening. This is deadly for the people whose property this pipeline is forcibly put through on a local level and causes climate change on a global scale.

Also, the wells this pipeline would be pulling from will leak even when the company isn't using them or when the company eventually finishes pulling from them. Even if they're filled with concrete, which can cost hundreds of thousands of dollars, this becomes a temporary solution because the concrete will erode eventually in 40 to 60 years, when the people who run this company are dead and don't have to deal with the consequences their actions caused.

This will become a problem that my generation has to deal with. We don't even want the pipeline in the first place. In summary, they are claiming you have to choose methanol over coal because of the lesser of two evils, but instead, you can choose no equals. You can't solve climate change by adding more fossil fuels. Thank you for your time.

Caroline Ceravolo

Hi, my name is Caroline Ceravolo and I'm a 16-year-old from Ridgefield, Washington. Yesterday the wildfire smoke again reached our house, making our air unhealthy to breathe. It's better than last week, I guess, when we were thankful that the air quality was only hazardous, instead of so hazardous that it's off the chart. The scientific consensus is that this is made worse by global warming. I have heard that this methanol refinery is supposed to help with climate change. Do they mean help climate change or help fight climate change?

I know I'm only 16, but I know that adding methane to our atmosphere is not how to reduce greenhouse gases. You reduce greenhouse gas emissions by pulling fossil fuels out of our economy, not by building an additional fossil fuel facility, to say otherwise is magical thinking. If you allow for this facility, you are helping climate change, you are rooting for it.

When I am the age of our president, it will be the year 2076. By then we will be way past all the deadlines of getting rid of fossil fuels from our economy. Will you still be alive? What areas in the United States will be habitable considering the preponderance of drought, wildfire, flooding, hurricanes, sea-level rise, and storms so intense that we have only seen in Hollywood movies? Where will be livable for me? Because as bad as 2020 has seemed, this will be considered the good old days.

Our atmosphere hasn't even warmed to the degree it will from all the greenhouse gases currently living in our atmosphere. This is what you're leaving kids like me with. I have no position of power, but you do. Sometimes it's hard to do the right thing. I'm sure if you reject the permit for the methanol refinery, you'll get sued, you can make people mad, but at least you should be able to sleep at night. At least you will send my generation the message that you do understand science and that you do see us. You'll be giving us a chance to clean up the messes left by your generation and those ahead of you, because if you allow this methanol refinery to operate, you are burying my future. Thank you for hearing my testimony.

Phillip Englund

My name is Philip England. I'm part of Sunrise Selfless Washington, in Vancouver, Washington. As we know, the climate crisis we're in is now undeniable. Every year, it keeps getting hotter and hotter, and we keep breaking heat records to the point where the entire West coast this year has been on fire. Well, we haven't burned down yet, we're still faced with smoke that went beyond the hazardous, it broke the meter. This is just the beginning, this is going to keep happening, this is going to keep getting worse and worse unless we take strong and immediate steps to save our [inaudible].

A methanol refinery is not the way to do that. All this talk of market conditions, the global market and these graphs, that's a capitalist show game, it's imaginary, it's a mirage. There's no [inaudible], that just because we put up a refinery in Kalama China isn't going to go," Okay, well, they put up one, well, let's shut down a couple of ours", it doesn't work like that. Then we're going to have all refinery going, they're going to have their refinery going, the only thing this does is put millions of tons of carbon into the air.

This is mitigation measures that they say they're going to do are not only insufficient, we don't need mitigation. This is not a step in the right direction, this is not good for the climate in any way, shape, or form. We need not to have this at all. In the strongest term's possible, I urge the department of ecology to deny this permit. This is our future we're fighting for, these are our lives we're fighting for, and that is pretty frigging serious. Thank you so much. I wrap up.

Mark Leed

The proposed methanol refinery would produce millions of tons of greenhouse gas pollution each year for 40 years. 4.6 million tons of carbon pollution per year is inconsistent with Washington's climate goals and with protecting Washington shorelines. To begin with, the SCIS underestimates upstream emissions, using even the most conservative estimates, upstream greenhouse gas pollution will exceed ONE million tons per year. In addition, methane leaks from abandoned gas wells were omitted from consideration. It is well known that abandoned gas wells continue to leak methane for decades.

The SCIS concludes that greenhouse gas impacts can be mitigated. It relies on Northwest Innovation Works flood speculative analysis to argue that methanol could displace dirtier energy. Rather than engaging in a highly speculative market analysis, ecology should focus on the known pollution that will come from the facility. Nobody knows what worldwide energy markets will do over the next 40 years, but we have reasonably accurate estimates of the carbon pollution the refinery will create. Ecology should not assume that future energy needs must be met by fossil fuels.

The SCIS market analysis presents a false choice between bad options, all of them massive polluters, none of which will solve our climate crisis. Thank you for your time.

Tina Barrows

My name is Tina Barrows. I live in Vancouver, Washington. It breaks my heart to hear that there's 15 and 16-year-olds on this testimony asking for us to not fuck up their lives. I have to agree with them and ask to oppose the building of this facility because I do not agree that fossil fuels are the way of the future. Building a fossil fuel facility that's potentially better than what we have right now is just the wrong path.

Scientifically looking at climate change, we know it's induced by global warming and we will have a huge biodiversity loss and unstable weather patterns, which will eventually disturb the earth's ability to sustain humans. I am a single divorced woman with cats, my only worry is who's going to feed the cats when the shit goes down. I'm asking all of you people on the panel who make the decisions. I know you're doing your job, I know you have all the facts, but I presume you also have children. You might have grandchildren. I asked you for their sake.

Since I have time left, also what hasn't been addressed yet, which I also feel is important, is that building more fossil fuel infrastructure destroys the land, it hurts indigenous people, the most vulnerable populations that we have, and it's just wrong. We need to go forward with clean energy sources or with reductions in our consumption, which is my personal opinion. It's a small decision to make whether Washington builds a facility, but it's going to be on a global scale a large factor, so I'm asking to choose wisely. Thank you.

Don Steinke

Hello, I'm Don Steinke, my wife will follow me. I'm a retired physics teacher. In response to all those in favor of the project, we are being given false choices between two negatives, between two unacceptable pathways. Your children's future will be destroyed by either one of them. Yes, plastic is a wonderful material, but instead of making so many single-use plastic bags, we could say that plastic for better purposes. In fact, we banned some plastic bags in this state by 2022 and other jurisdictions are doing likewise.

The emissions from making paper bags are no better. The building trades don't have the right to change this part of the world forever so that you can have a two-year job. To ecology, I say, in your final EIS, please answer these questions. Is this proposal consistent with a sense of urgency and the latest IPCC report? Is this proposal consistent with the Paris climate accord which China signed? [inaudible] clean air rule requires polluters like this on the paper mills on long [inaudible] to reduce emissions 5% every three years, how will this project do that? Will pipeline leaks being monitored and fixed promptly? Exactly how will accompany mitigate their emissions and will their plan mitigate their in-state emissions the first year?

When given a range of impacts, why did you choose the least harmful option instead of the worst-case scenario? The models that EPA and others provide for estimating emissions are notorious for low balling. Will you include methane leaks from abandoned wells? Include the emissions from burning plastic. Most of the plastic that we think we recycle actually gets burned. Include those displacements for EVs by this project and the emissions from trucks working in the fracking fields. Now from my wife Alona, thank you.

Alona Steinke

My name is Alona Seinke. I'm a retired RN from Clark County and a member of the Healthy Climate team with Physicians for Social Responsibility. What do these places have in common? Pine Ridge, South Dakota. Camden, New Jersey. Immokalee, Florida. Welch West, Virginia? These are sacrificed zones. Those areas of the country that have been offered up for exploitation in the name of profit, progress, and technical advancement. Where human beings and natural world are used and then discarded in order to maximize profit.

Methanol plants produce waste that poison the air, exacerbating and increasing the rates of asthma. Chronic respiratory diseases, cardiovascular disease, and cancer. This leads to lost wages, education interrupted, and increased hospitalization and healthcare costs. How would that be mitigated? Cowlitz County already has a high rate of asthma. The county's death rate for chronic lower respiratory disease is 54% higher than statewide.

According to the Community Needs Index scores, the rates of poverty and poor health, in general, are much higher here than in the state or nation. Kalama is seen as an easy mark for the exaggerated promise of jobs. Please deny this project, do not offer up Kalama for exploitation in the name of profit. Do not allow it to become another sacrifice. The people of Kalama are not disposable. Thank you.

Diana Winther

Hello, my name is Diana Winther. I'm a resident of Cowlitz County and a supporter of the Northwest Innovation Works Facility in Kalama. I'm also an attorney by trade and I believe in focusing on facts and analysis above feelings when it comes to making important decisions in my life and in the life of my community. I first want to thank the Department of Ecology, you have the challenging mission of protecting, preserving, and enhancing the environment for current and future generations. The second, SCIS is proof of your commitment to that mission. The consideration of public input into a scientific analysis of the facts under a variety of scenarios.

It is proof that this facility will create a net reduction of global greenhouse gas emissions by at least 6 billion metric tons a year. If opponents of this project brought this to me as a case, I would turn it away. Not because I'm a climate denier, I would simply point out that they had already won. It demanded a cleaner project, they got it. They asked for further study, they got it. If it were my job to advocate for a cleaner tomorrow, I would point to NWIW and demand that any new facilities meet or exceed the bar is set.

This project has proof that concerned citizens can effectively campaign for change and they should be proud of that accomplishment, but from the testimony I've heard throughout this process, it sounds like project opponents are simply in the business of saying no. It sounds like they don't believe in the necessity of plastic for medical equipment, like ventilators. That they don't realize that olefins are required to build the wind turbines and the electric vehicles of the green economy we should all be working towards.

Project opponents also seem to ignore the fact that the community of climate exists because of a balanced of industry and environment. We have paper mills and chemical factories and a steel manufacturing plant all within a few miles of each other along the Columbia River. These facilities offer real careers, including benefits that can support a family and provide for a dignified retirement. Unlike the low-wage service jobs that others have suggested are good enough. Thank you.

Lacey Breton

I urge you to deny this permit for the methanol refinery, and here's why. Look, folks, we just lived through two weeks, only two weeks of toxic air and we could see it. We can smell it. We knew it was there. None of us could leave our houses unless it was absolutely urgent, unless we had a job that we had to go outside, but kids were stuck inside. The methanol refinery will do the same thing as the forest fires just did. We won't be able to see it, but it'll be there. The promise of permanent local jobs is a mirage.

I've had experience working with community colleges and developing and maintaining their education programs. A program in Cowlitz County at the local University here is unsustainable, both in a steady stream of qualified candidates and in funding. Who's going to train these, "Local employees" for permanent jobs? For those of us who are from this area, I live in Kalama. For those of you rather who support this project, I certainly don't, where are we going to go? Who's going to help us when there's an accident. Not if, but when, because anyone who promises -and we should all know this as adults- anyone who promises that there's not going to be any accidents, he's literally lying because, how can they know? They can't.

I was talking to Rosemary a couple of weeks ago in the midst of the election. I asked her why she was supporting this project and she said she wanted to show that Cowlitz County can handle large and complex problems like this. I had to say, "Rosemary, why do you think they came here when they failed elsewhere? It's because they're looking for politicians who are inexperienced in this kind of project and wouldn't know any better." China has lied and misled about the end use of this project, and that should be a red flag to us all.

Look, I would like a high paying job too close to my house, but I'm not going to ask for it at the expense of the health of my neighbors. I care about you too much to support this project.

Cathryn Chudy

Ecology did the right thing when "expecting" NWIW to provide accurate and truthful answers to relevant questions on the proposed Kalama facility. The current SSEIS released on Sept. 2 became necessary when Ecology's persistence met the stone wall of a company that is long on promises and short on truthful and reliable answers when it comes to being honest and forthright with regulators and the public.

The original proposal for a facility twice the size of Kalama, to be built and operated in Tacoma, stalled in part back in 2016 over failure of this same company to answer basic health and public safety questions posed by the public and the Port Commissioners at Tacoma. A replay of this failure by this company to truthfully, factually, fully and adequately answer questions about the scope, nature and impacts of this proposed facility in Kalama once again forced Ecology to pursue substantive answers to relevant questions.

What you did establish with this second supplemental EIS is that upstream, on site and downstream emissions will result in an INCREASE (not a decrease or removal) of climate pollution in Washington.

The "Hail Mary" that proponents are grasping at in order to make their dubious case with Ecology involves a diversion from reality by taking us down the yellow brick road to the OZ of speculation and "if/then" thinking, that somehow has been converted into a case for environmental gain where there literally, factually is none.

"Voluntary mitigation" may sound reassuring to some, but add on the convenient phrase "to the extent possible" and you have an empty promise that more than likely will disappear into thin air as profits are pocketed outside of Washington and our children and grandchildren inherit the climate pollution mess that cannot be wished or "mitigated" away so easily.

There are good reasons that our Governor Inslee has said clearly that he cannot support this methanol facility in our state, and his climate agenda supported by legislation has established climate goals that protect, not endanger, our children's future and the future of the next seven generations. Ecology can and should do all it can to act in accordance with those wise climate goals. Ecology is the guardian of our air, land and water - you must not sign off on this proposal masquerading as a "climate solution" without betraying the trust we and those who come after us place in you.

I urge you to deny the Shorelines permit and reject this project once and for all.

Don Steinke

OK, my final comment.

I began commenting by thinking about impacts you left out that should be included in the SSEIS.

Now I turn to elements that were inserted by the proponent that should not be in the EIS and should be removed.

Remove the speculative, business as usual, market assumptions!

James Gus Speth from Yale, is a member of the National Academy of Sciences. He says that this planet will not be fit to live on, if we continue business as usual.

To include business as usual in your SSEIS is to accept our eventual destruction.

Remove the speculative, business as usual, market assumptions from the SSEIS.

Dela Zitkus

2020 brought us the hottest January on record, the hottest May, and the hottest September. Ever. April and June came extremely close to breaking their records.

The whole argument for or against the methanol refinery comes down to whether you believe it will increase or decrease greenhouse emissions. Let's use logic here. We'd be adding capacity to pull more fossil fuels out of the ground and either burn them for fuel or make plastics. The only way that adding capacity could lower greenhouse gases is if this methanol displaces another more-greenhouse emitting one.

Since we can't force the Chinese to produce less coal-derived methanol, we should assume that this new methanol would simply be added to their current supply. NWIW's numbers are all based on the argument that this new refinery would displace current production of some coal-based methanol production. There is no basis for this argument. Since China is a sovereign government and not a U.S. territory, we can't tell them what to do. Once the methanol leaves for China on a tanker ship, it's gone. What they do with it is their business. NWIW may be singing a sweet tune now, but once the refinery is built, all bets are off. The only control we have is now. The only power we have is to not build this refinery. I urge the Department of Ecology to deny the permit.

Mike Reuter

Hello, my name is Mike Reuter. I am speaking here as an individual and not as the Mayor of Kalama. I have serious concerns that Northwest Innovation Works is not going to be here long enough to be accountable for long term concrete emissions mitigation. The reason why I have these dots are as follows. According to Washingtons Secretary of State, Pan-Pacific Energy, the parent company of Northwest Innovation Works, UBI number 603371412 is a foreign profit company. They report 11 to 28 workers to L&I. As of September 15th, 2020, Northwest Innovation Works LLC, Kalama no longer has an active license with L&I in Washington. According to ProPublica, Pan-Pacific Energy received \$150,000 to \$300,000 in CARES Act loans to maintain eight jobs.

My question is, is this really a Chinese-backed company or a group of speculators trying to find enough money to survive after British Petroleum pulled out as their biggest partner? How can the CARES Act loans were given to Pan-Pacific Energy and not for Northwest Innovation Works? If the port and the county really believe that Northwest Innovation Works will abide by the commitments for greenhouse gas emissions, the EPA should be the ones who will be responsible as Northwest Innovation Works is not able to comply with its requirements. If every environmental group doesn't fall for the claims that this company has promised, how can the Department of Ecology do so? Thank you very much

Sarah Scott

Thank you so much. My comment consists of this. Please just don't do this. I agree with all of the succinct, wonderful comments against it. I'm simply a mom here in Richfield, near Kalama. I support Jay Inslee voting against it. If it's not good for Tacoma, how can it be good for my area? This is a beautiful, pristine, natural area. Please visit it, please save it. This doesn't make sense ecologically or financially for this area.

Just don't let this happen, I beg of you. I have no problem using pure emotion and beg you not to let this happen. Thank you.

Mary Elizabeth Thiel

My name is Mary Elizabeth Thiel, and I'm a Kalama, Washington resident. Last year, my husband and I became new parents and we're excited to raise our daughter in this community where the people are friendly and hardworking. This area allows us to be in an ideal location where we can be close to nature and enjoy all the outdoor activities. This is including but not limited to fishing, hiking, boating, kayaking.

Many of these activities utilize materials that are made from synthetics not to mention the clothes we currently wear, the technology I'm using to speak with you now, and the PPE we are currently required for our safety. Stating that we need to move away from plastics is hypocritical at best as I know other items such as car seats, hospital equipment, piping and or tires, just as much as the rest of us do. The materials needed to manufacture these items comes from China and other parts of the world that is out of view from our watchful eye.

We are presented now with an opportunity I cannot ignore to make a positive impact in our world to reduce GHGs. Just as the smoke from our fires in our region spread around the world so does the pollution created from the production methods currently used around the world. I support Northwest Innovation Works and their project. Their project puts the town of Kalama and the State of Washington in a position to be a leader in creating cleaner resources with technology that is groundbreaking while creating a cleaner world.

If Northwest Innovation Works project hadn't been delayed these past four years, and when the Department of Ecology's best estimate should be believed we could have saved the world a projected 24 million tons of GHGs. I commend the Department of Ecology for their hard work competing their independent SEIS, which also proves North Innovation Works mission. Here I am now pleading with you to pass this permit to allow Northwest Innovation Works to start building this project.

We are tired of waiting and are ready to make a change that can be felt around the world while supporting our community. My husband and I want to leave our daughter a world that is better than it is now. One that not only has cleaner air but it's full of hope and opportunity.

Zach Thiel

My name is Zach Thiel and I am a Kalama resident as well. I am a husband and a father and strongly consider myself an avid outdoorsman. Adding to what my wife said, I would also like to voice my support for the Northwest Innovation Works project and thank the Department of Ecology for their due diligence in their SEIS study. Please approve this project and let's get this bill. We are tired of waiting and we are tired of false stats, and we are tired of ignoring what science keeps proving time and time again, just being disregarded.

Climate change is real, and we need a meaningful action. In addition to the positive climate impacts this project proposes, we cannot ignore the positive impacts this company will bring to our economy and our community. I implore you, please approve the permits for this project. Thank you very much.

Michelle Trickey

Hi, my name's Michelle Trickey. I'm here from Seattle though I have family all over the country and I absolutely represent people affected really far from here. One thing that you should know about me is that I work for Amazon, so I'm not anti-corporate in any particular way. I've been working there for five years. I anticipate working there for another five. I really am worried about the corporate interests in the Northwest Innovation Works project and the way that they're skewing the way that we're looking at facts.

It's true that when you just look at the point of burning methanol is cleaner than burning carbon dioxide, but that completely doesn't look at the upstream leakage, which this report estimates at a far lower number than most other reports, to a point where we're taking conservatism to an absurd level. That means that we're underestimating the carbon equivalent impact of the methanol refinery by about tenfold. That really perturbs me as a person who works in corporate America and knows that our decisions need to be based on the best available data and that we shouldn't be stuck on what we were looking at five years or 10 years ago and need to be looking at the most updated information.

I care a huge amount about climate change as do most people. Two of my friends are having babies this week. The new mom is not far from my future as well, but this is not the right way to do it. If this is the best path forward that we have to offer our children, I really despair. I just like to let the Department of Ecology know that I thank you so much, but please do not accept this facility. Please adjust the methanol leakage rates.

Nancy Elbert

I was born and grew up in Longview, WA.

I do not believe the SEIS adequately addresses upstream pollution in the lifecycle study for the proposed Kalama methanol refinery. For instance, the refinery would increase the amount of natural gas moving through the current pipeline, and inevitably more pipelines (not just a short extension spur to the refinery) would need to be built once reserves are drawn down. (I resent this because by state law, new pipelines have to be paid by ALL ratepayers, not just the refinery "hog" that would be creating the need for new pipelines in the first place.)

Natural gas lines are known to have not insignificant leaks and even "smallish" sounding amounts of 1% - 3% escaping are extremely harmful for climate change due to methane being 50 times more greenhouse gas-producing than carbon dioxide. Don't forget also the harmful effects to people who are nearby. Infants and children do not have agency and cannot simply move away from the problem.

The natural gas feedstock is proposed to be sourced from fracking to take place in British Columbia, but in all likelihood that will not be enough and eventually it will also need to come from fracking in the Rocky Mountain States. Regardless of source, fracked gas is known to disturb bedrock, cause earthquakes, and most terribly of all: poison groundwater with chemicals that cause cancer, birth defects, miscarriage, and stillbirth. The SEIS does not adequately take into account the harm caused by fracking, especially because Life Cycle Associates, (hired and paid for by proponents of the refinery), carefully selected their statistics to paint a cheery but inaccurate picture of the long-term affects of the additional fracked natural gas that would be needed for feedstock to the refinery.

I ask that the following be taken into account when performing analysis of this proposed project: 1) climate effects of fracked gas; 2) climate effects of pipeline leaks (with realistic leakage rates) and 3) the many harms to nearby inhabitants where fracking is taking place and where there is leakage. If these three things are fully taken into account, you will understand why I oppose building this methanol refinery. Thank you.

Liam Doucet

My name is Liam Doucet. I am 18 years old and here on behalf of myself and my family who live in the city of Portland, Oregon. That said, I do hold a volunteer position at Historic Pearson Airfield in the city of Vancouver, Washington. I am here because I strongly oppose the plan to build a methanol refinery next to the Columbia River, and on top of the land indigenous nations call home and rightfully so. The threat that the facility will pose to the Northwest and its people is nothing short of catastrophic.

A vibrant ecosystem of animals and people both along the Columbia and even way up North, as far as the sailors see rely on the Columbia River to bring salmon, which is now at risk of extinction because of the lower Snake River dams. A methanol refinery built will end up sealing a deadly fate for all salmon either before or when the leak happens. Yes, I do mean when not if. Looking at the history of methanol plants and frankly, all chemical plants in this country, negligence, and abuse seems to be a common factor when a disaster happens.

Unfortunately, not every single worker at this facility will be competent enough to make sure all systems work properly. If I learned anything from what happened 36 years ago in the city of Bhopal, India it's that failing safety systems is a classic blunder that happens with almost all American-owned refineries. At least 16,000 civilians were claimed dead the night an American chemical refinery operated by American workers released toxic vapor into the skies of India when its neglected fail-safe broke. The people of the nations native to Kalama would be the very first ones to be hit by any spill or vapor release which will severely injure and kill thousands of them and eventually even kill or seriously injure a large American population only 30 minutes from the proposed refinery which my family and I are part of.

Despite the country I was born in supporting the finest military in the world, I doubt that they're willing to hand out any kind of modern treatment or protective gear to those who would be affected. To whoever is responsible for the creation of this refinery, there's no doubt that you won't provide for those people affected. You decided to build the largest refinery on earth next to these people and didn't even ask them which says a lot about how much--

>> Hi, Liam, you're going to have to provide the rest of your comments in writing and we'll go ahead and go over that information at the end of the hearing.

Don Steinke

After reading the comment from Cowlitz County, I respond as follows:

As I understand it, SEPA includes ALL impacts, there is no such thing as going beyond your authority in terms of impacts or scope.

The impacts of Kalama Methanol are not likely to be mitigated. There is no way to be sure the impacts will be mitigated. In fact, the proponent plans to mitigate only the impacts within the state. Say so in your SSEIS and reject the project.

Anonymous Anonymous

My name is Mark [inaudible]. My wife and I live here in Kalama. We oppose this project. We appreciate the opportunity to comment on the SSEIS. One of the long-term social and economic costs is the KMMEF and other fossil fuel projects are approved. We're at a tipping point best described by higher temperatures that are melting glaciers and ice packs changing how our earth reflects and absorbs light. We're seeing [inaudible] shifts that are changing how plants and animals can survive during extreme heat and cold weather, uncharacteristic of the geography. We're seeing circulation changes in the atmosphere and oceans bringing extreme conditions that our fisheries and aquatic plants cannot survive.

We're at a tipping point, and a slower rate of fossil fuel consumption is not going to push all the global warming. We must stop it now. We're living with the effects of fossil fuels consumed as far back as 100 years ago. The last time the earth warmed this rapidly was 56 million years ago. The framework for the economic analysis presented in section 3.4.5 of the SSEIS is flawed. It is focused only on the GHG emissions alternatives. It doesn't address their negative economic impacts on climate change, only the positive ones. It fails to address the following economic costs none of which can be considered positive environmental impacts.

The cost of fighting wildfires and subsequent disaster relief, the cost of lost timber and harvest as a result of wildfires, decreasing timber harvest as a result of hotter and drier weather, loss of commercial fishing revenue, directly or indirectly as a result of decreasing salmon, steelhead and shellfish harvest. State and federal disaster money is committed to, due to the extreme weather events and fishery disasters, repairs to public roads and utilities as a result of extreme weather events. I can go on.

>> Mark, I'm going to have to ask you to summarize your comments in writing and we'll go over that information at the end of the hearing.

Carrie Parks

My name is Carrie Parks. I'm a longtime resident of Vancouver who knows that 2020 is not an unusual year. This is the beginning of a new normal being caused by a fossil fuel industry which has spent years squelching cleaner technologies. The local tribes are against this plant. The Native Americans lived here for thousands of years without damaging the environment the way that white people have in only 172 years of European settlement. Maybe they know something, and maybe we ought to listen to them. We should deny this permit. I want to address some of the talking points I've heard from the other side.

Northwest Innovation Works and their supporters are cherry-picking the science they want, which is bad science. To tell us that we're ignoring science is ridiculous. You've heard from lots of legitimate scientists talking about the real facts in these hearings. You can observe the pandemics, fires, floods, hurricanes, droughts, and other effects with your own eyes.

The world scientists are almost unanimous in warning us that climate change is killing our planet, and us with it. We have to stop polluting. You're talking about it being a positive impact on the environment, polluting a little bit less than some other plant that may or may not be there. That's just ridiculous and insulting.

Dumping another million tons of greenhouse gases into the atmosphere every year for 40 years is not going to get us where we need to go. The factory will provide good jobs to the local community. That's a lot of what I hear people saying, but you are ignoring all the jobs you are killing, agriculture, tourism, restaurants, the local campground, fishing, hiking, the jobs destroyed by fires, floods, hurricanes, and ocean acidification. Those are jobs too. Those are also people that need to support their families. The choice that Kalama has is not between this plant and no jobs-

>> Carrie, we're going to have to ask you to summarize your comments. We'll go over that information at the end of the hearing.

Ituna Environmental Club

My name is Ryan Welch. I'm the President of Skyview High School's Chapter of the Ituna Environmental Club. It's now the largest youth-led environmental activism group in Southwest Washington. It's with an eye on the future of my generation, and of those to come, that I'm speaking today in opposition of the proposed Kalama methanol refinery.

Ecology's analysis has improved since the initial report, but it remains far too speculative. In addition to the uncertainty shown right up front in the sensitivity analysis, there is a huge unanswered question in the form of burning methane. Northwest Innovation Works originally stated that none of the methanol that their fracked gas facility produced would be burned for power. Now they've quietly flip-flopped, but they haven't provided a solid figure for how much might be burned. We can't afford any increase in co2 emission and the fact that we still don't know what the increase would be is damning. Now, in reading the EIS, it seems like the entire argument revolves around the world having two possible sources of energy, Columbia methanol, or worse sources environmentally, and this is a dangerous false dichotomy. We don't have to accept a future that's powered by fossil fuels.

If the supporters of Columbia methanol truly stand by it because of procedure environmental benefits, then why not go one step further? We can replace methanol in any form with renewable energy sources. Really that is the only choice we have now to avert climate collapse. This is not a complicated decision. It boils down to this. Will Ecology stand up for the health and well-being of Washingtonians or will they bend to the wishes of those who consistently mislead state regulators?

The climate crisis filled our skies with smoke not even a week ago. This project would only accelerate environmental damage to the stage. We're in a climate emergency, which means that half measures won't cut it. We demand a clean future, not a cleaner future. Ecology must reject Northwest Innovation Works' proposal. Thank you.

Kirk Leonard

Washington state will be locked into decades of additional climate pollution from the proposed methanol refinery.

The speculation this project could displace coal in China is not adequate justification for the known pollution that will be released into the atmosphere that will harm the climate and communities in this region.

If built, the Kalama methanol refinery would create an enormous increase in greenhouse gas emissions, moving Washington further away from achieving the climate goals for this state.

As a member of the Kalama community, I have a vested interest for the quality of life everyone can enjoy and be proud of. Please deny the permit.

I urge you, the Department of Ecology to honor your mission to Protect, Preserve and Enhance the environment for current and future generations.

State Representative from District 13

>> My name is Alex Ybarra. I'm a state representative from District 13, which is North Central Washington. Most importantly, I'm an advisor for the energy strategy Advisory Committee, which is tasked with meeting all of the 100% clean bills meaning we have a goal to limit the amount of carbon issued into the air in 30 years and the goal is set. Some of the things that we consider on achieving those climate goals is electricity generation, buildings, transportation, and manufacturing. This particular project would be part of the manufacturing goals that we need to meet in order to meet our climate goals over the next 30 years to keep the climate clean for our future kids.

At the end of the day, the goals will be met. If this plant goes up, the goals will be met no matter if the plant is up or not, but we will achieve those climate goals that have been set in legislature. Another thing that I'd like to also talk about is forest fires. I live in eastern Washington and every fire that comes across, most of them in the Cascades come directly to my hometown of Quincy, Washington.

We had smoke for a week and a half before there was any smoke in the Seattle area at all because the fires come to us. If you talk to the folks that live in Kittitas County, Yakima county in the fire areas, it's not due to climate change, it's due to forest management. We had \$65 million set aside to do more forest management which was not passed by a portion of the legislature so there was no forest management to happen. It's forest management that needs to happen to stop the forest fires, not climate change. We're doing something about climate change with the 100% clean bills.

Re: Comments on the Draft Second Supplemental Environmental Impact Statement (DSSEIS) for Northwest Innovation Works (NWIW) Methanol Refinery and Export Terminal

Dear Director Watson,

We write today to provide comments and relay our deepest concerns regarding the DSSEIS for the NWIW methanol refinery and export terminal, which would increase local and regional emissions of GHG pollutants, degrade air quality and harm the health of residents of Kalama, Cowlitz County and the State of Washington. The DSSEIS contains technical flaws which have the effect of minimizing the amount of GHG pollution to be emitted over 40 years. We believe the proposed facility presents a grave danger to public health and should be rejected.

I'm a retired Physician Assistant and have worked in the Emergency Department of a Regional Trauma Center and in Family Medicine. I participated, as did health professionals and many concerned Cowlitz County residents, in the development of the November 27, 2018 Health Impact Assessment (HIA) for the Millennium Bulk Terminal-Longview proposal. My husband is an Infectious Disease physician and Emeritus Professor at Oregon Health Sciences University (OHSU).

One of several goals of the HIA was to increase understanding among Cowlitz County residents about the connections between major development projects and health and health equity. Those who engaged in the HIA process are well aware of the documented health status of many residents of Cowlitz County and Kalama and the issue of **environmental injustice**.

<http://www.co.cowlitz.wa.us/DocumentCenter/View/15492/MBTL-HIA-and-Apps---November-2018---WEB?bidId=>

From the [HIA](#) (p. 25): "Health data shows that the people of Cowlitz County already experience rates of death and hospitalization for some diseases related to air pollution that are higher than the Washington state average, especially lung and heart diseases."

"When disease rates are higher than the state average in a community, especially when that community is experiencing social and economic conditions that contribute to these differences, it is considered a health disparity. If an additional risk is added, such as increased air pollution to a community that already has health disparities, it is considered an environmental justice issue. Cowlitz County and affected neighborhoods

are more vulnerable to the types of health risks associated with increased air pollution than other parts of Washington State would be.”

p. 59

HIA Table 3 : Mortality Rates per 100,000 Population for Selected Cardiovascular Conditions Related to Air Quality and Noise Exposure (2011-2015)

Kalama's mortality rate for myocardial infarction is statistically significantly higher than the state rate ($p < 0.05$).

p. 25

Deaths from heart disease in Cowlitz County were about 10% higher than the state average.

p. 25

Deaths from combined chronic lower respiratory diseases were about 52% higher in Cowlitz County compared to Washington State as a whole.

p. 31

Cowlitz County consistently ranks near the bottom of Washington counties in health indicators.

pp. 40 and D-10

“What is certain, if increasing global GHG emissions from human activities continues on a “business as usual path,” residents in Washington State and Cowlitz County will experience far greater harm than if the level of GHG emissions at the global level are dramatically reduced sufficient to arrest the increase in atmospheric GHG concentrations and limit global warming to under 2^0 C.”

My husband and I are acutely aware of the increased threat from exposure to GHG emissions and other toxic pollutants during production and transport of methane, during transformation of this fracked gas to methanol, during further transport and through controversial end uses. We cannot and must not ignore these negative impacts of new GHG emissions on human health.

We are concerned about potentially disastrous cumulative impacts – adverse impacts that cannot be mitigated by unenforceable voluntary actions offered by NWIW, a company that has made contradictory and false statements (regarding end uses of the methanol) to the State of Washington or potential investors or both.

Please consider this additional information from the 2018 Health Impact Assessment which demonstrates the risks of increased GHG emissions, climate change, related air pollution and environmental injustice to Cowlitz County residents:

Impacts on Health of from Climate Change due to project GHGs: Appendix D

p. D-1

The effects of climate change vary by location. In Washington State, some changes already observed include an average temperature increase of 1.30 F and a lengthening of the frost free season by 35 days (+/- 6 days) between 1895 to 2011, as well as more frequent nighttime heat waves.[7] Overall, glaciers and springtime snowpack has declined, with a 49% decline in glaciated area on Mt. Adams between 1904 and 2006.[7]

p. D-4

Projected future changes in Washington's climate include further decline in snowpack and a shift away from snow-dominant and mixed rain-snow dominant watersheds toward rain-dominant watersheds (Figure D-6). Changes in Washington's climate in the near-term and mid-term future will likely increase hazards to human health. Without preventive and protective measures, this will worsen a variety of health outcomes at the population level. Climate change is also expected to increase health disparities by disproportionately impacting those who already bear a larger burden of risk factors and illness, such as people with lower income, people with existing chronic disease, the socially isolated, those with a disability, immigrant and refugee populations who may have less English language fluency, and some communities of color.

p. D-5

Hazards to health that are climate-sensitive and likely to grow as the effects of global warming intensify include:

Heat-related Illnesses. Currently in Washington State, between 25 to 113 people are hospitalized for heat illnesses every year, about 50% of whom are age 65 and older.[10] Risk for heat-related illness, hospitalization, and death increases during extreme heat events,[11, 12] although hot weather safety measures can protect people from exposure.[10] Bethel and colleagues have predicted that more frequent heat waves in the northwest will increase the burden of heat-related illness such as heat stroke, and exacerbate chronic illness for people with cardiovascular, respiratory, and kidney disease. Other populations at risk include outdoor laborers, children, and people ages 65 and older.[13] Figure D-7 shows extremely hot days in Washington. Cowlitz County experienced more extremely hot days in 2016 than other parts of the state.[14]

Respiratory and Other Conditions Exacerbated by Pollen and Wildfire

Smoke. Researchers expect the pollination season to lengthen and the production of allergy-causing proteins to increase.[9, 15] A longer and more intense allergy season would increase the burden of allergy and asthma symptoms. Drier, warmer conditions are expected to increase the number of acres burned by wildfire in Washington,[7] increasing the potential for exposure to wildfire smoke[13] and exacerbating heart and lung disease. Wildfire smoke events are associated with an increase in emergency room visits and hospitalizations for respiratory-related illness.[16, 17, 18, 19]

Vector Borne and Zoonotic Diseases. Diseases such as West Nile virus, Zika virus, Lyme disease, Hanta virus, and others transmitted by vectors (e.g., mosquitos, ticks, rodents) are influenced by climate's direct effects on habitat, the pathogen, the vector, the vertebrate reservoir host (e.g., birds and mammals), and their interactions with one another. Climate change is expected to alter the distribution of vector species and may increase the extent of suitable habitat for some vectors, thus increasing risk of exposure and disease. For example, M. Hahn and colleagues predict more suitable habitat in southwest Washington counties for the tick *Ixodes* spp (Figure D-8).[20] The genus *Ixodes* spp includes *Ixodes pacificus*, which carries Lyme disease, is the more prevalent species in Washington. (SW WA counties more suitable habitat for tick *Ixodes*.)

p. D-6

Water-Borne and Food-Borne Disease. Risks to water quality may grow as a result of increasing frequency of heavy precipitation events, flooding, and sea-level rise, as well as from drought and wildfire. Drinking water systems, including private wells, inundated with flood waters could affect water quality and increase risk of water borne illness or disrupt drinking water services. The risk of exposure to harmful toxins found in some types of algal blooms is also expected to increase. Harmful algal blooms in freshwater bodies pose risks to health if the water body is a source of drinking water. Toxic algal blooms can also affect health if people use the contaminated water for recreational activities like swimming. Marine biotoxins can contaminate shellfish and temporarily increase the risk of foodborne illness.[9]

p. D-7

Risks from Extreme Events. Power outages and other impacts of storms, flooding, drought, and wildfire can interrupt provision or access to critical services, destroy property, and displace people. The mental health effects of these traumas can have long lasting effects.[9] More frequent, more extreme, and more overlapping events are anticipated across the United States and in the northwest.

Mental Health Effects. Changes in climate are expected to take an increasingly large toll on mental health and wellbeing as a result of both increasing acute and gradual effects of climate change. Some populations are more vulnerable to these effects than others, including children, the elderly, people with pre-existing mental illness, the economically disadvantaged, the homeless, first responders, and those whose sustenance and livelihood depend on the natural environment. The threat of climate change itself has been shown to have a negative impact on mental health.[9]

p. 58

Baseline Health of Cowlitz County Baseline conditions in Cowlitz County and neighborhoods along the rail line assessed as part of this Health Impact Assessment were found to be experiencing health disparities. Health disparities are preventable differences in the burden of disease, injury, or opportunity to achieve optimal health experienced by socially disadvantaged groups. Examples of preventable differences in the burden of disease can be seen in the tables below. Some notable differences include:

- Some neighborhoods had more than double the rate of death from chronic lower respiratory diseases compared to the state average.
- Some neighborhoods and Cowlitz County had statistically significantly higher rates of death from heart disease.
- No neighborhood had a rate of disease or death that was statistically significantly lower than the state average for any condition assessed. Health disparities are experienced by socially disadvantaged groups. In Cowlitz County, these groups include a higher proportion of the population who have less than a high school degree, are living with a disability, are living in a mobile home, are unemployed, and/or are living in poverty.
- More information about the social and economic determinants of health for Cowlitz County and the neighborhoods near the rail line can be found in this Health Impact Assessment in Appendix E, *Population Characteristics*.

p. C-20

The health effects related to air pollution would more likely be experienced in people with pre-existing conditions, such as heart and lung diseases, respiratory infections, cerebrovascular disease, and diabetes, as well as in infants, children, pregnant women, and people over 65 years of age. Health data from 2011 through 2015 indicates the people of Cowlitz County and some neighborhoods that would have air pollution impacts in the study area, already experience rates of death and hospitalization for some diseases related to air pollution, especially respiratory diseases that are higher than the state average. This indicates the population of Cowlitz County and affected neighborhoods would be at even greater risk of experiencing health effects than other parts of Washington.

=====

We are very disappointed in the approach used by DOE, with technical flaws that appear to mask or ignore the burdens that will be placed on Kalama, Cowlitz County and the State of Washington should the project be approved. The projected GHG emissions are based on speculation and support of a worst-case scenario in 40 years. This represents a failure to consider that Washington may continue efforts to meet and exceed climate goals. Never has the American public been so aware of and concerned about climate chaos, the overlapping risks to air quality and water quality, forests and our health. There is a failure to consider a scenario whereby, on a national level, reasonable climate goals/GHG goals may be implemented during the next administration. There is a failure to consider the scenario in which China meets or beats its recently stated goal to be carbon-neutral by 2060.

We also urge you to consider an appropriate methodology that utilizes more robust measurements of methane release/escape from fracked gas infrastructure. Please use fly-over data, so as not to undercount dangerous emissions.

We face sufficient challenges to deal with existing sources of GHG gases. Decision-makers must not commit to massive new fossil fuel infrastructure that is guaranteed to emit at least 4.6 million tons of GHG pollutants each year for 40 years.

If this project is approved, a vicious cycle will be expanded and locked in:

- Increased GHG emissions
- Increased emissions of Toxic Air Pollutants
- Degraded air quality increases risks to the health of Kalama, Cowlitz County and Washington residents
- Increased risk of deadly forest fires in Washington
- Degraded air quality from forest fire smoke exacerbates heart and lung disease, increasing morbidity and mortality.
- Increased health risks, especially for vulnerable populations, result in worsening health outcomes for Covid-19 patients and/or victims of future pandemics

We must prevent what we cannot cure. Please do not approve this project, which would be the largest fracked-gas-to-methanol facility in the world. Please do not make a mockery of Washington's climate and public health goals. Please do not exacerbate health risks at this pivotal moment in our history.

Take action and help prevent catastrophic climate disruption that will harm the health and safety of Cowlitz County and Washington residents. We urgently and respectfully request that you reject the flawed sections of analysis for this project, reject the methanol refinery, deny the Shoreline Permit and protect the health of our communities, our climate and our precious Earth. Thank you for considering our comments.

Sincerely,

Regna Merritt, PA (retired) Member Advisory Board and Healthy Climate Action Team

Oregon Physicians for Social Responsibility

Thomas T. Ward, MD Emeritus Professor of Infectious Diseases

Diana Gordon

I think there is real reason to doubt that the methanol from the proposed Kalama refinery will be used to produce plastics. I fear that it, or a large portion of it, will be used as vehicle or other fuel instead.

The reason is straightforward. There are several methods of producing olefins and they are readily available. In 2016, for instance, eighty-two percent of the world's most-used olefin, ethylene, was produced by steam cracking of naphtha and ethane. Naphtha is produced by refining crude-oil, and ethane is a co-product of natural gas production, both tried and true technologies. Only 2% was from methanol.

I think that China will decide that it makes more sense to go with the cheapest methods and use the Kalama methanol for fuel. I doubt that they would build any new coal-to- methanol plants at this point - they have pollution problems as well as a climate plan to go carbon neutral by 2060.

Methanol burned as fuel produces more GHG's than using it to manufacture plastics: $2 \text{ CH}_3\text{OH} + 3 \text{ O}_2 \rightarrow 2 \text{ CO}_2 + 4 \text{ H}_2\text{O}$ - so we get CO_2 which stays in the atmosphere much longer than methanol and has long-lasting global warming effects. Added to that, methanol has only about half the energy density of gasoline and therefore about twice the volume of methanol would be used to go the same distance as gasoline.

Using part or all of this product as fuel would seem, then, that the Kalama refinery would really be a fuel refinery and should be referred to EFSEC and the Governor to decide if we want to dump this amount of GHG's into the atmosphere.

We cannot be sure exactly what the Chinese will do down the road. We do know, however, that, if they do not abide by their agreement, there is no Olefin Police Force to ride in to rescue the climate from the added and illegal GHG's.

The climate problems this year - uncontrollable fires, early hurricanes, a lingering and devastating drought to name a few and all caused or exacerbated by climate change - all signal to us that this is the wrong time and the wrong place for this refinery. It is our time and our responsibility to wrap our arms around Washington's climate goals. We must do what we can to make fossil fuels and greenhouse gases problems that we are actively making progress against.

Please deny the Shoreline Permit for this plant.

John Flynn

Department of Ecology

KMMEF-Draft SSEIS

In reviewing the Draft SSEIS for the proposed KMMEF methanol refinery I was disappointed to find no reference whatsoever to the negative impacts of ocean acidification from greenhouse gas emissions and CO2 absorption on marine ecosystems. These impacts include negative affects to commercial fishing, recreational fishing, aquaculture (oyster farming) and last but not least to the Native American tribal communities that depend upon the marine ecosystem for cultural and subsistence gathering.

In February of 2012 then Washington Governor Christine Gregoire convened the Blue Ribbon Panel on Ocean Acidification and tasked that panel to produce a set of recommendations to guide Washingtons response to ocean acidification. The results of the panels findings were submitted to the Governor on November 27, 2012.

A technical document titled "Scientific Summary of Ocean Acidification in Washington State Marine Waters" was created. This document was the foundation for the Panels report "Ocean Acidification:From Knowledge to Action, Washingtons State's Strategic Response".

On November 27, 2012 Governor Gregoire signed Executive Order 12-07 directing the Department of Ecology to implement the recommendations of the Panel, which listed as its number one priority the reduction of carbon dioxide (greenhouse gas) emissions.

In December of 2017 an addendum was released that expanded upon the original 2012 report by the Blue Ribbon Panel on Ocean Acidification. All of these documents can be found on the Department of Ecology website. They are an integral part of Ecology's mandate to protect and preserve Washingtons environment. Ecology must abide by the mandate given to them.

My question to Ecology is why is there no mention of or reference to the impacts of an estimated 4.6 Million Metric Tons of greenhouse gas emissions per year from the proposed Kalama methanol refinery and its effects on ocean acidification? The Department of Ecology was and continues to be involved in studying the impacts of ocean acidification from CO2 absorption resulting from greenhouse gas emissions. Therefore, it is only logical to conclude, that ocean acidification as a result of greenhouse gas emissions would be part of any analysis included in the Draft SSEIS.

I ask the Department of Ecology to not be derelict in their duty to include these impacts in their SSEIS. I am confident that if the Department of Ecology seriously looks at the negative economic and cultural impacts of ocean acidification to commercial, recreational and tribal fishermen and women resulting from the greenhouse gases emitted

from this proposed project they will categorically deny any and all permits for the proposed Kalama methanol refinery.

Do your duty and deny this project.

Thank you.

Sheri Jacobson

I urge you to reject this project. Annual emissions from the manufacturing process alone would add over a million tons of carbon pollution to our air. It would also emit hazardous chemicals like ammonia and nitrogen oxide. It will use government funds for a project that will hurt our environment instead of being used for something to help it. My home state of Oklahoma is wracked by earthquakes as a result of fracking. I don't want my adopted state of Washington to become another fossil fuel victim. Please stand up for the citizens of Washington and reject this project.
Sincerely, Sheri Jacobson

Lucy Pierce

I am a retired teacher from the Longview School District and own my own home here in Cowlitz County.

The proposed Kalama methanol refinery is a 2.1 Billion project ❖ That's Billion with a "B." By asking for a federal guaranty loan, NWIW, a Chinese-owned subsidiary, wants the U.S. taxpayer to assume ALL of the risk of refinery. What kind of position does this put us in if the Chinese later decide to slap a 25% tariff on U.S.-produced methanol in response to President Trump's tariffs on Chinese goods? What if other global buyers of methanol won't pay much as we assumed at the time of the proposal? We, the American taxpayer will have NO leverage with the Chinese and will bear the full cost of a now-useless refinery, road and dock improvements, pipeline extensions, etc. I also heard that up to 400 million dollars could come from the Washington State Public Employees' Retirement System funds, such as PERS and TRS (my teachers' pension). So if this refinery goes bust, that's an awfully big chunk of money for our public employee pensions to lose. I don't want my children and grandchildren to pay the price of bad decision-making on the part of our leaders today, and I certainly don't want my teachers' pension funds used to build a refinery that will increase the amount of greenhouse-gas producing methane that is produced in the world.

I would also like to know why it is that Washington State and County governments are offering approximately \$143 Million in tax incentives without any "clawback" provisions written into the deal so that if NWIW doesn't come through (in providing the number of local jobs and pay rates that they have promised to our community), we don't have to honor the \$143 Million in tax incentives. What incentive does NWIW even have to provide the promised number of jobs, salaries, etc. without a clawback provision? Other states and cities in similar positions have insisted on clawbacks... Why are our local leaders so afraid to do the prudent thing and demand them?

Lastly, the proponents of the refinery are making wild speculations about net climate benefits, because it assumes that China will use the methanol to replace dirtier coal. We have NO assurance that that will come to pass. We have NO way to measure whether the Chinese are in fact, reducing their usage of coal-derived-methanol. They have not made any concrete agreement with us that they will in fact replace any coal-derived methanol, and even if they did, we'd have NO way to enforce said agreement. Most likely, they will simply ADD this new supply of methanol to their current activities, not replace any "dirtier" form of consumption.

Russell Jacobson

Please reject this project. We need to be moving away from fossil fuels but this plant would lock us into fossil fuels instead. It would use an enormous amount of water from the Columbia and Kalama River aquifers just at a time when water usage and shortages is becoming critical. Toxic fumes from the plant will adversely affect the health of thousands of residents. These are only a few of the many negative impacts this project would have on Washingtonians. I urge that you not let this let this project go forward. Sincerely, Russell Jacobson

Brian Blake

Throughout my career, whether as a logger, an environmental specialist, or a legislator I've seen the people of southwest Washington work hard to balance their strong sense of community and pride they take in the natural beauty of our area with the need to promote more economic development that protects our environment. Today, with NW Innovation Works' proposed methanol facility at the Port of Kalama, we have the ability to strike the right balance between creating jobs and protecting our air, land, and water while making measurable progress in combatting climate change.

This project has been under intense review for nearly six years. The company and its regulators have proceeded with full transparency and the public has been meaningfully involved in process every step of the way. Like most big projects, this one has attracted some opposition ♦ that's part of the democratic process.

My friends in the progressive and environmental activist communities should take pride in knowing that their aggressive advocacy around this project has meant that we have all the facts to know that moving forward with this project is not just good for jobs, but good for creating a more sustainable and accountable system to measure climate change impacts and mitigate for them. NW Innovation Works' project meets the tests needed to move forward: we have all the facts, we know the impacts on our community, and we know that building the project will reduce the release of greenhouse gas emissions associated with manufacturing the products we all use every day.

The Department of Ecology's Second Supplemental Environmental Impact Statement details how building the Kalama methanol facility will result in a net reduction of 6 million metric tonnes of greenhouse gas emissions annually, which is equal to eliminating approximately two times the number of GHGs as the entire city of Seattle emits annually.

I have worked hard, on a bipartisan basis, with my legislative colleagues to ensure that the Washington State Department of Ecology's review of this project was both thorough and timely. With the just released Draft Second Supplemental Environmental Impact Statement, I think the Department has met those goals. After receiving comments and completing the response process, there should be no further delay in finalizing the analysis and issuing all necessary permits. I intend to continue to work with my legislative colleagues to hold the Department accountable in this regard.

While Cowlitz County has rebounded from the deepest parts of the recession to a certain degree, it has been left behind the economic boom that much of the state is experiencing. Many of the county's economic and social indicators lag behind the rest of the state, which can be traced to a lack of access to good, family-wage jobs.

Southwest Washington historically has one of the highest unemployment rates in western Washington. The latest statistics indicated that the county's labor force participation is substantially lower than the national rate and that average annual wages are well below the state and national averages. Too many Southwest Washington families live in or near levels of poverty. The problem is especially acute for children with far too many living in poverty. Southwest Washington has significantly higher rates of poverty for the same cohorts for the state as a whole.

This lack of opportunity and the stresses families face in Southwest Washington result in impacts to school readiness and other social determinants. As an example, less than a third (30%) of Cowlitz County children are assessed to be kindergarten ready when measured by the WaKIDS' six domains. This compares to 47% for the state overall.

Many project opponents who don't live in Southwest Washington seem to think that these statistics will somehow, magically get better on their own, or they ignore them. They won't get better on their own and we can't ignore them.

Jobs make a difference for communities. Cowlitz County does not have enough good paying jobs. We need to create more. NW Innovation Works will create the right kind of jobs for our community.

The project is estimated to create 1,000 jobs during construction, 200 direct permanent family wage jobs during operations, and 500 indirect and induced jobs. They will support \$700 million in local spending on labor, goods, services and produce \$21 million in annual salaries - a significant percentage spent at local businesses.

NW Innovation Works is committed to local jobs and has agreed to a Project Labor Agreement with the Longview/Kelso Building and Construction Trades, along with the full support of the Washington State Building and Construction Trades Council and the Cowlitz/Wahkiakum Central Labor Council. This means that local Trades people are guaranteed the first chance at work opportunities on this project. Local workers making a family wage translates into the investment dollars spent on this project staying in the community and supporting the local economy. Increase in apprenticeship opportunities for our local youth, unemployed or underemployed community members.

And NW Innovation Works has planned partnerships with Lower Columbia College, Workforce Southwest Washington, and the Cowlitz County Economic Development Council to establish a program for training and hiring permanent employees from the local community that will include full tuition and stipend for students who are accepted into the training program and full-time living-wage employment at the facility upon program completion.

NW Innovation Works is investing in the community. Increased local spending will grow small businesses, increase land and property values and enhance overall opportunity & quality of life for residents. And the project will generate much needed tax revenue. NW Innovation Works has neither requested nor received changes in tax law or special tax treatment to build in Cowlitz County. The company will pay an estimated \$57.9 million in taxes during construction and \$30-40 million in annual taxes during operations which will further enhance the quality of life for local residents and their families - New community facilities, enhanced community services and infrastructure & improved local schools.

These are meaningful benefits that cannot be substituted for by rhetoric or good intentions.

Climate change doesn't respect borders. It is a global issue and our response to it must be done in a way that recognizes we are all in this fight together.

The Department of Ecology's report confirms that we are in a time of large and rapid increases in

global demand for methanol. Nowhere is demand for methanol rising faster than in China. China consumes approximately 50% of the world's methanol and approximately 80% of the methanol China produces is derived from coal. The Chinese government has continued to promote efforts to use their abundant coal resources for high value industries, notably, the chemical industry.

If we don't help to meet that demand here ♦ in an environmentally sound way ♦ that demand will be met by someone else ♦ probably in the Middle East, Russia, or China. That's not conjecture. That's a fact.

And what we know from the Department of Ecology report is that by producing the methanol in Kalama at NW Innovation Works' facility, we will reduce greenhouse gas emissions. If we let others do it, those emissions will go up. Why would we pick that? The answer is, we shouldn't.

We now know, from the highest environmental regulatory authority in the state all that we need to know about this project. We are a state with tough environmental standards. This project meets those standards.

Opponents should join project supporters in understanding the bottom line facts regarding the environmental benefits moving forward with this facility means and embrace the progress represented by the project. Efforts to further delay this project means two things: bad outcomes for the working families of southwest Washington and bad outcomes in our fight against climate change.

Stacy Neal

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Daphne White-Hall

My name is Daphne White-Hall, and I'm a native Washingtonian. I currently live in Lewis County. I'm a young professional and a student. I am very concerned about our economy and our environment, which is why I'm in total support of the Kalama project. I appreciate the review done by the Department of Ecology, and I believe it is very important for the department to proceed with this project. Right now we have an opportunity to build a stronger economy and to help our environment. Many times those issues are in opposition.

However, that is not the case with the Kalama project. Building the project will help a post-COVID-19 economy recover by providing over 1,000 jobs and 30 to \$40 million in new taxes. That is outstanding. In addition, it will reduce global greenhouse gases by six million tons. As global demand for methanol increases, we need to have the project here in Washington State with the environmental regulations that we have using natural gas rather than Iran or Russia using coal without the same standards of environmental regulations.

We need to put this good science to work while benefiting our communities. Our families need real jobs and our region and State need real investment. Our economic problems were tough before and are getting worse with the COVID-19 crisis. We need to take action right now. I encourage the Department of Ecology to permit this project without delay. Thank you very much.

Daniel Serres
