respond. Opportunities are being missed, with the Green Climate Fund yet to receive projects specifically focused on improving climate-related public health, despite the fact that in other forums, leaders of small island developing states are recognising the links between health and climate change (indicator 5.3). In response, the generation that will be most affected by climate change has led a wave of school strikes across the world.

Bold new approaches to policy making, research, and business are needed in order to change course. An unprecedented challenge demands an unprecedented response, and it will take the work of the 7·5 billion people currently alive to ensure that the health of a child born today is not defined by a changing climate.

Introduction

Human wellbeing, and the stability of local communities, health systems, and governments, all depend on how they interface with the changing global climate.^{9,10} Across the world, an average temperature increase of 1°C from a pre-industrial baseline¹² has already resulted in extreme climatic and environmental changes, with severe storms and floods, prolonged heatwaves and droughts, new and emerging infectious diseases,^{11–13} and compounding threats to food security. Left unabated, climate change will define the health profile of current and future generations, will challenge already overwhelmed health systems, and undermine progress towards the UN Sustainable Development Goals (SDGs) and universal health coverage (UHC).^{14,15}

The Intergovernmental Panel on Climate Change (IPCC)'s 2018 Special Report on Global Warming of 1·5°C emphasises the scale of the response required: global annual emissions must halve by 2030 and reach net-zero by 2050 to limit warming to 1·5°C, while recognising that no amount of climate change is considered safe.² Placing health at the centre of this transition will yield enormous dividends for the public and the economy, with cleaner air, safer cities, and healthier diets. Analysis focused on one of these pathways—cleaner air through more sustainable transport and power generation systems—suggests that the economic gains from the health benefits of meeting the Paris Agreement substantially outweigh the cost of any intervention by a ratio of 1·45 to 2·45, resulting in trillions of dollars of savings worldwide.¹⁶ When the health benefits of any increase in physical activity that results from modal shift are taken into account, the economic gains increase significantly.¹⁷ These analyses complement an assessment from outside the health sector, which estimates that a robust response to climate change could yield more than US\$26 trillion and 65 million new low-carbon jobs by 2030, compared with a business as usual scenario.¹⁸

Monitoring this transition from threat to opportunity and demonstrating the benefits of realising the Paris Agreement is precisely why the *Lancet* Countdown on health and climate change was formed. As an international,

independent research collaboration, the partnership brings together 35 academic institutions and UN agencies from every continent. The indicators and report presented here represent the work and consensus of climate scientists; geographers; engineers; energy, food and transport experts; economists; social and political scientists; public health professionals; and doctors.

The 41 indicators of the 2019 report span five domains: climate change impacts, exposures, and vulnerability; adaptation planning and resilience for health; mitigation actions and their health co-benefits; economics and finance; and public and political engagement (panel 1).

Strengthening a global monitoring system for health and climate change

This collaboration builds on three decades of work around the world, which has sought to understand and assess the scientific pathways that link climate change to public health.¹³ In 2016, The *Lancet* Countdown launched a global consultation process, actively seeking input from experts and policy makers on which aspects of these pathways could and should be tracked as part of a global monitoring process. A large number of indicators were initially considered, and then narrowed down into the five indicator domains and published, along with a request for further input.¹⁹ The final set of indicators were selected on the basis of the presence of credible scientific links to climate change and to public health; the presence of reliable and regularly updated data, available across temporal and geographic scales; and the importance of this information to policy makers.²⁰

Overcoming the data and capacity limitations inherent in this field, and remaining adaptable to a rapidly evolving scientific landscape has required a commitment to an open and iterative approach. This has meant that the analysis provided in each subsequent annual report replaces analyses from previous years, with methods and datasets being continuously improved and updated. In every case, a full description of these changes is provided in the appendix, which is intended as an essential companion to the main report, rather than a more traditional addendum.

The 2019 report presents 12 months of work refining the metrics and analysis. In addition to updating each indicator with the information collated over the course of 1 year, three key developments have occurred.

Firstly, methodologies and datasets have been strengthened for indicators that capture heat and heatwaves; labour capacity loss; the lethality of weather-related disasters; terrestrial food security and undernutrition; health adaptation planning and vulnerability assessments; air pollution mortality in cities; household fuel use for cooking; and qualitative validation of engagement from the media and national governments in health and climate change.

Secondly, the geographical and temporal coverage has been expanded for indicators that capture marine food

Panel 1: The Lancet Countdown indicators

Climate change impacts, exposures, and vulnerability

- 1.1: health and heat
 - 1.1.1: vulnerability to extremes of heat
 - 1.1.2: health and exposure to warming
 - 1.1.3: exposure of vulnerable populations to heatwaves
 - 1.1.4: change in labour capacity
- 1.2: health and extreme weather events
 - 1.2.1: wildfires
 - 1.2.2: flood and drought
 - 1.2.3: lethality of weather-related disasters
- 1.3: global health trends in climate-sensitive diseases
- 1.4: climate-sensitive infectious diseases
 - 1.4.1: climate suitability for infectious disease transmission
 - 1.4.2: vulnerability to mosquito-borne diseases
- 1.5: food security and undernutrition
 - 1.5.1: terrestrial food security and undernutrition
 - 1.5.2: marine food security and undernutrition

Adaptation, planning, and resilience for health

- 2.1: adaptation planning and assessment
 - 2.1.1: national adaptation plans for health
 - 2.1.2: national assessments of climate change impacts, vulnerability, and adaptation for health
 - 2.1.3: city-level climate change risk assessments
- 2.2: climate information services for health
- 2.3: adaptation delivery and implementation
 - 2.3.1: detection, preparedness, and response to health emergencies
 - 2.3.2: air conditioning—benefits and harms
- 2.4: spending on adaptation for health and health-related activities

Mitigation actions and health co-benefits

- 3.1: energy system and health
 - 3.1.1: carbon intensity of the energy system
 - 3.1.2: coal phase-out
 - 3.1.3: low-carbon emission electricity

- 3.2: access and use of clean energy
- 3.3: air pollution, energy, and transport
 - 3.3.1: exposure to air pollution in cities
 - 3.3.2: premature mortality from ambient air pollution by sector
- 3.4: sustainable and healthy transport
- 3.5: food, agriculture, and health
- 3.6: mitigation in the health-care sector

Economics and finance

- 4.1: economic losses due to climate-related extreme events
- 4.2: economic costs of air pollution
- 4.3: investing in a low-carbon economy
 - 4.3.1: investment in new coal capacity
 - 4.3.2: investments in low-carbon energy and energy efficiency
 - 4.3.3: employment in low-carbon and high-carbon industries
 - 4.3.4: funds divested from fossil fuels
- 4.4: pricing greenhouse-gas emissions from fossil fuels
 - 4.4.1: fossil fuel subsidies
 - 4.4.2: coverage and strength of carbon pricing
 - 4.4.3: use of carbon pricing revenues

Public and political engagement

- 5.1: media coverage of health and climate change
- 5.2: individual engagement in health and climate change
- 5.3: engagement in health and climate change in the UN General Assembly
- 5.4: engagement in health and climate change in the corporate sector

security; national adaptation planning for health; health vulnerability assessments; climate information services for health; the carbon intensity of the energy system; access to clean energy; and Chinese media engagement in health and climate change.

Finally, new indicators were constructed that capture exposure to wildfires; the transmission suitability for *V cholerae*; the benefits and harms of air conditioning; emissions from livestock and crop production; global health-care system emissions; economic cost of air pollution; and individual online engagement in health and climate change.

Ongoing research aims to establish indicators for concepts that are inherently difficult to quantify, such as the mental health effects of climate change. Three indicators included in previous years—covering migration, global health adaptation funding, and academic

engagement in health and climate change—are not presented in the 2019 report, as further work is being done to improve their methods and to ensure that they are able to be sustainably reproduced in the future. These indicators will be re-introduced in subsequent years.

For the second consecutive year, these changes represent substantial updates to most of the indicators, and knowledge is increasing at a pace that will only accelerate as funding and capacity from the Wellcome Trust and the *Lancet* Countdown's partners grows. Going forward, the collaboration will seek to further strengthen its scientific processes, continuously review its indicators, and produce internally coherent frameworks to guide the development of new indicators. To this end, The *Lancet* Countdown remains open to new input and participation from experts and academic institutions willing to build on the analysis published in this report.

Health and climate change in 2018

The 2019 report discusses the worsening health effects of climate change. Over 220 million additional exposures to heatwaves (with each exposure defined as one person aged 65 years or older exposed to one heatwave) occurred in 2018, compared with a 1986–2005 climatological baseline, higher than ever previously tracked (indicator 1.1.3). This occurred at a time when demographic vulnerability to these extremes continued to increase across every region (indicator 1.1.1), and the warming experienced by human populations reached four times that of the global average temperature rise (indicator 1.1.2). Around the world, resultant losses in labour capacity were reported, with several southern states in the USA losing as much as 15–20% of daylight capacity (for workers in construction and agriculture; indicator 1.1.4). The effects of this warming extended to other extremes, with 152 countries experiencing a marked increase in the daily population exposures to wildfires compared with baseline (indicator 1.2.1). Regarding infectious diseases, 2018 was ranked second on record as having the most suitable conditions for the transmission of diarrhoeal disease and wound infections from *Vibrio* bacteria, and 9 of the past 10 most suitable years for the transmission of dengue fever have occurred since 2000 (indicator 1.4.1). The distribution of exposure and effect is not equal, with several indicators reporting greater changes in low-income settings than in high-income settings—for example, in parts of Africa, South-East Asia, and the Western Pacific (indicator 4.1).

Despite these worsening effects, the carbon intensity of the global energy system has remained flat since 1990 (indicator 3.1.1) and use of clean fuels for household services is stagnating (indicator 3.2). Perhaps of greatest concern is that total primary energy supply from coal increased by 1.7% from 2016 to 2018, reversing a previously observed downward trend (indicator 3.1.2), and carbon dioxide (CO₂) emissions from the energy sector, far from falling, rose by 2.6% from 2016 to 2018 (indicator 3.1.1). Global fossil fuel subsidies rose to US\$427 billion in 2018—a 33% rise from 2017 (indicator 4.4.1)—and emissions associated with health care now represent 4.6% of global emissions, rising across most major economies (indicator 3.6). Fossil fuel use continues to contribute to ambient air pollution, which resulted in 2.9 million premature deaths globally in 2016 (indicator 3.3.2).

Although these emerging health impacts and the lack of a coordinated global response portray a bleak picture, they also mask important promising trends. Several encouraging trends continue, such as reductions in investment in new coal capacity and a fall in coal as a share of total electricity generation (indicators 4.3.1 and 3.1.2). Renewable energy accounted for 45% of total growth in 2018 (indicator 3.1.3), and low-carbon electricity represented an impressive 32% share of total global electricity generation in 2016 (indicator 3.1.3). The reduction in air pollution recorded in Europe from 2015 to 2016, if maintained across a lifetime, could result in an annual

reduction in YLL valued at €5.2 billion (indicator 4.2). These changes are reinforced by new commitments from the UK²¹ and France²² to reach net zero by 2050, with other countries soon expected to follow.

Notably, the world is beginning to adapt, with 50% of countries and 69% of cities surveyed reporting the completion or undertaking of a climate change risk assessment or adaptation plan (indicators 2.1.2 and 2.1.3). Increasingly, these plans are being implemented, with 70 countries providing meteorological services targeted towards the health sector in 2019 and 109 countries achieving medium to high implementation of a national health emergency framework (indicators 2.2 and 2.3.1).

In the health sector, the UK's Royal College of General Practitioners and Faculty of Public Health divested their fossil fuel investments in 2018, joining many universities, non-governmental organisations, and pension funds from across the world (indicator 4.3.4). Alongside this, new analysis suggests a growing and more sophisticated recognition of the health benefits of the response to climate change in the media (indicator 5.1).

Many of the trends identified in the 2019 *Lancet* Countdown report are deeply concerning. Greenhouse-gas emissions continue to rise. Nevertheless, the continued expansion of renewable energy, increased investment in health system adaptation, improvements in sustainable transport, and growth in public engagement suggests ongoing reasons for cautious optimism. At a time when the UN Framework Convention on Climate Change is preparing to review commitments under the Paris Agreement in 2020, accelerated ambition and action is required in order to meet the world commitment to remaining “well below 2°C”.²³

Section 1: climate change impacts, exposures, and vulnerabilities

Climate change and human health are interconnected in a myriad of complex ways.¹³ Building on the *Lancet* Countdown's previous work, section 1 of the 2019 report continues to track quantitative metrics along pathways of population vulnerability, exposure, and health outcomes that are indicative of the cost to human health of climate change, and thus of the urgent need to reduce greenhouse-gas emissions. The impacts tracked here in turn motivate and guide climate change adaptation (section 2) and mitigation (section 3) interventions.

Changes in warming and weather events are not evenly distributed across the globe, and some populations, including children, the elderly, and outdoor workers, are more vulnerable than others. Efforts to track the unequal effects of climate change are reflected through indicators that focus on particularly vulnerable populations, and low-income and middle-income countries experiencing the worst of these effects.

Although it is certainly true that the effects of climate change vary by geographical location and that these effects will not always be negative, any so-called positive effects

are often short-term in nature, and quickly outweighed by other exposures. One such example is seen in Australia, where any benefit that might have been gained from CO₂ fertilisation is both small and largely outweighed by greater climate variation, with crop yields now stalling as harvests are increasingly affected by more frequent drought.²⁴ Even disregarding the negative effects of temperature change, any CO₂ fertilisation benefits are likely to be short-term, as rising CO₂ concentrations will negatively affect grain quality.^{25–28}

For 2019, a new metric tracking exposure to wildfires has been added (indicator 1.2.1), as has an expansion of climate suitability of infectious diseases (indicator 1.4.1), to now include *V. cholerae* transmission risk. These indicators portray a world which is rapidly warming, where environmental and social systems are already being exposed to the effects of climate change, which are subsequently affecting human health.

Indicator 1.1: health and heat

The most immediate and direct impact of a changing global climate on human health is seen in the steady increase in global average temperature, and the increased frequency, intensity, and duration of extremes of heat. The pathophysiological consequences of heat exposure in humans are well documented and understood, and include heat stress and heat stroke, acute kidney injury, exacerbation of congestive heart failure,²⁹ and increased risk of interpersonal,³⁰ and collective violence.³¹ In particular, during periods of extreme heat, young children have a greater risk of electrolyte imbalance, fever, respiratory disease, and kidney disease.³² Four indicators that are related to heat are discussed here, tracking the vulnerabilities, exposures, and labour implications of a warming world.

Indicator 1.1.1: vulnerability to extremes of heat—headline finding: vulnerability to extremes of heat continues to rise among older populations in every region of the world, with the Western Pacific, South-East Asia and African regions all seeing an increase in vulnerability of more than 10% since 1990

Certain populations are more vulnerable to the health effects of heat than others. Older populations are particularly vulnerable, especially those with pre-existing medical conditions (such as diabetes and cardiovascular, respiratory, and renal disease).³³ Outdoor workers, while younger and healthier overall, are also vulnerable due to heightened exposure to heat and sunlight. This indicator presents a heat vulnerability index which ranges from 0 to 100 and includes the proportion of the population older than age 65 years, prevalence of chronic diseases, and proportion of the population living in urban areas, with the data and methods unchanged from previous years (appendix p 1).

Populations older than age 65 years, in all regions of the world, are becoming increasingly vulnerable. However, the highest increase in vulnerability from

1990 to 2017 has been seen in the Western Pacific (33·1% to 36·6%) and African (28·4% to 31·2%) regions. Overall, Europe remains the most vulnerable region to heat exposure (followed closely by the Eastern Mediterranean region), due to its ageing population, high rates of urbanisation, and high prevalence of cardiovascular and respiratory diseases, and diabetes.

Indicator 1.1.2: health and exposure to warming—headline finding: human populations are concentrated in the areas most exposed to warming, experiencing a mean summer temperature change that is four times higher than the global average

This indicator compares the population-weighted summer temperature change from a 1986–2005 baseline with the global average summer temperature change over the same period, using weather data from the European Centre for Medium-Range Weather Forecasts,³⁴ ERA-Interim project and population data from the NASA Socioeconomic Data and Applications Center (SEDAC) Gridded Population of the World (GPWv4).³⁵ Full details, along with an explanation of improvements for the 2019 report, which uses higher resolution climate and population data (0·5°C grid instead of 0·75°C grid) are provided (appendix p 3).

The population-weighted temperatures continue to grow at a substantially faster pace than the global average, increasing the human health risk. The global average population-weighted temperature has risen by 0·8°C from the 1986–2005 baseline to 2018, compared with a global average temperature rise of 0·2°C over the course of the same time period.

Indicator 1.1.3: exposure of vulnerable populations to heatwaves—headline finding: in 2018, an increase of 220 million heatwave exposures affecting older populations was observed, breaking the previous record set in 2015.

Japan alone experienced 32 million heatwave exposures, the equivalent of almost every person aged 65 years and older enduring effects of a heatwave in 2018

Heatwaves across the northern hemisphere made headlines in 2018, reaching new highs for a number of countries.³⁶ The definition of a heatwave, the demographic data,³⁵ and methods used here remain unchanged from previous reports (appendix pp 4).³⁷ Each heatwave exposure event is defined as one heatwave experienced by one person older than age 65 years. This indicator was also improved with a higher resolution (0·5°C grid instead of 0·75°C grid).

The change in heatwave exposure events relative to the 1986–2005 average are presented (figure 1). The increase in heatwave exposure events (220 million, which is 11 million more than the 2015 record) was due to a series of heatwaves across India (45 million additional exposures); across central and northern Europe (31 million additional exposures in the EU); and across northeast Asia, where heatwaves affected Japan, the Korean peninsula, and Northern China. 32 million exposures affected people

older than age 65 years in Japan alone, the equivalent of almost every person in this age group experiencing effects of a heatwave in 2018.³⁸

Indicator 1.1.4: change in labour capacity—headline finding: higher temperatures continue to affect people's ability to work. In 2018, 45 billion additional potential work hours were lost due to rising temperatures, compared with in the year 2000

General work productivity and ability to work are affected by temperature and humidity, which are both captured in the Wet Bulb Globe Temperature (WBGT) measurement. Labour productivity loss estimates for every degree increase of WBGT beyond 24°C range from 0·8% to 5%.³⁹

Figure 1: Change in the number of heatwave exposure events in people aged 65 years and older, compared with the historical 1986–2005 average number of events

Figure 2: Potential global work hours lost per sector due to heat, 2000–18

Reduced labour productivity is often the first symptom of the health effects of heat, and, if not addressed, could lead to more severe health effects, such as heat exhaustion and heat stroke.

This indicator emphasises the important impact of climate change on labour capacity in vulnerable populations.⁴⁰ It assigns work-fraction loss functions to different activity sectors (service, manufacturing, and agriculture), linking WBGT with the power (metabolic rate) typically expended by a worker within each of these three sectors. This is then coupled with the proportion of the population working within each of these three sectors to calculate potential work hours lost (WHL) by country. This indicator has been improved to include the effect of sunlight on the potential WHL by calculating the increase in WBGT using solar radiation data available from the ERA database (appendix pp 5–6).^{35,41,42}

The global atmospheric temperature and humidity in 2018 were slightly more favourable for work than in 2017, but the upward trend of potential WHL since 2000 remains clear (figure 2). In 2018, 133·6 billion potential work hours were lost; 45 billion hours more than in 2000.

Additionally, a map is presented of the equivalent potential annual full-time work lost in the sun and the shade (figure 3). Of note, for 300 Watts (W) work in the shade (typical for manufacturing), over 10% potential daily work hours were lost in densely populated regions such as south Asia. For 400 W work in the sun (typical for agriculture and construction), even workers in the southern parts of the USA (below a latitude of 34°N, with Alabama, Georgia, Florida, Louisiana, Mississippi, and Texas particularly affected), lost 15–20% of potential daylight work hours in the hottest month of 2018.

Indicator 1.2: health and extreme weather events

Indicator 1.2.1: wildfires—headline finding: 152 of 196 countries saw an increase in annual daily population exposure to wildfires in 2015–18, compared with in 2001–04, with India alone experiencing an increase of 21 million annual daily exposures. This increase not only poses a threat to public health, but also results in major economic and social burdens in both high-income and low-income countries

The health effects of wildfires range from direct thermal injuries and death, to the exacerbation of acute and chronic respiratory symptoms due to exposure to wildfire smoke.⁴³ Additionally, the global economic burden per person affected by wildfires is more than twice that of earthquakes and 48 times higher than that of floods, although the global number of events and number of people affected by floods are much higher than for wildfires.⁴⁴ Furthermore, climatic changes, including increasing temperature and earlier snowmelt, contribute to hotter, drier conditions, which increase the risk of wildfires. Yet, wildfires remain an important component of many ecosystems, although they can be ecologically harmful through human ignition or when forest management practices do not fully account for periodic, natural burning.

This new indicator represents the change in the average annual number of days people were exposed to wildfire in each country. It was developed using the Collection 6 active fire product from the Moderate Resolution Imaging Spectroradiometer aboard the NASA Terra and Aqua satellites.⁴⁵ Fire point locations were matched to a political border shapefile from the Global Burden of Disease (GBD), and consequently joined with population count per square kilometre, taken from NASA SEDAC GPWv4.³⁵ The result is an

annual sum of people experiencing a fire event per day. The mean number of person-days exposed to wildfire was recorded for years 2001–04 (the earliest years for which data with adequate coverage and resolution is available) and compared with the mean from 2015–18.

Overall, this indicator reports a mean increase of 464 032 person-days exposed to wildfire per year over the period studied; however, the increase in person-days recorded in some countries is far greater than

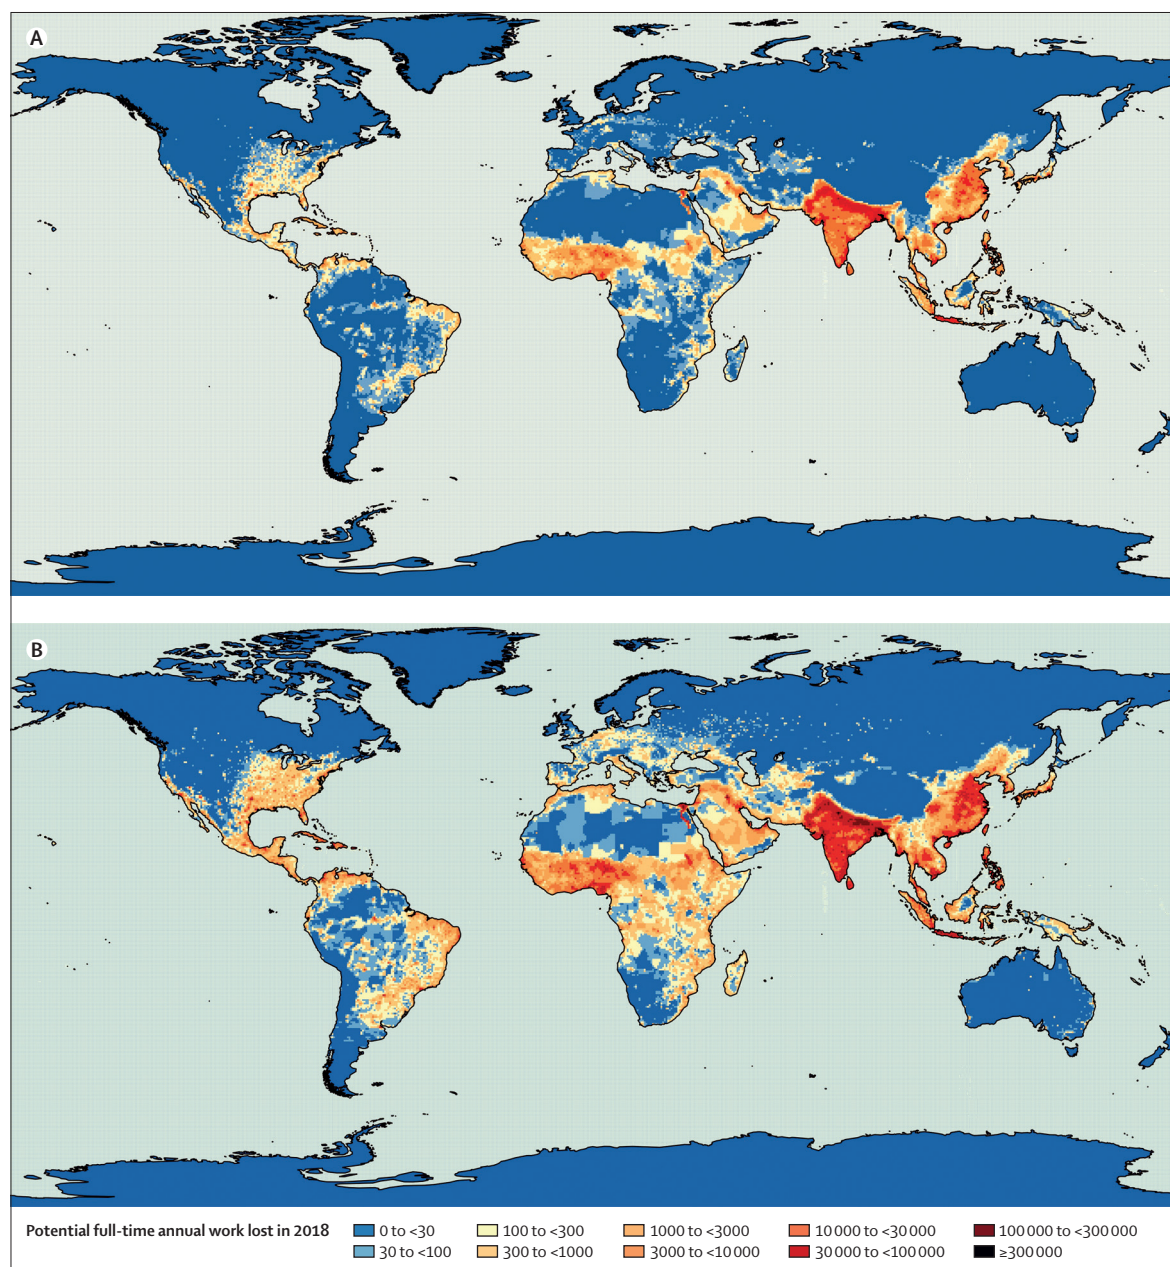

Figure 3: Potential full-time annual work lost in the shade (A) or in the sun (B) based on the percentage of people working in agriculture (400 W), industry (300 W), and services (200 W)
W=Watts.

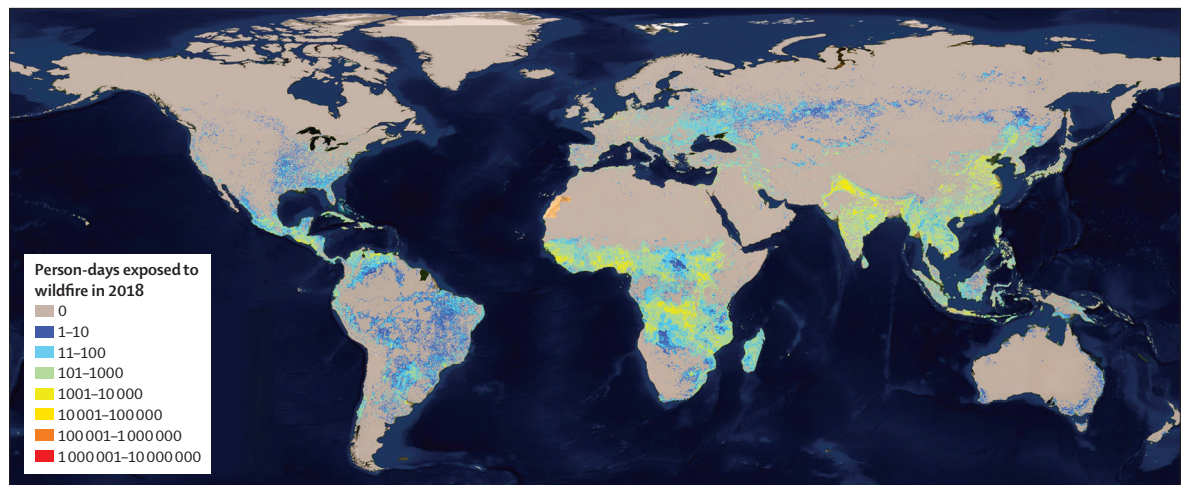

Figure 4: Map showing the average annual number of days people were exposed to wildfires in 2018

the mean global increase (appendix pp 7–8). India, China, the Democratic Republic of Congo, Iraq, and Mexico sustained the largest increase in the number of person-days affected by wildfires, with a maximum increase of nearly 21 807 000 person-days in India followed by 17 003 000 person-days in China (figure 4). Countries including Spain, Russia, and Uzbekistan saw substantial reductions in the number of people affected.

Crucially, this indicator will evolve over time to cover the health risks of wildfire smoke,⁴³ which can travel far distances and affect areas that are not directly exposed to fires.⁴⁶

Indicator 1.2.2: flood and drought—headline finding: extremes of precipitation, resulting in flood and drought, have impacted human health and wellbeing, with South American and South-East Asian populations experiencing long-term increases in both of these natural disasters

This indicator tracks exposure to extremes of precipitation, using weather and population data presented in previous reports (appendix pp 8–9).^{20,37} Analysis across time and space reveals regional trends for drought and extreme heavy rain that are more significant than global trends, reflecting the varying nature of climate change depending on the geographical region.

Floods are particularly problematic for health, resulting in direct injuries and death, the spread of vector-borne and water-borne diseases, and mental health sequelae.⁴⁷ The average number of extreme rainfall events in the 2000–18 period reveals that South America and South-East Asia are experiencing the largest increases.

Prolonged drought remains one of the most dangerous environmental determinants of premature mortality, affecting hygiene and sanitation, as well as resulting in reduced crop yields, food insecurity, and malnutrition.⁴⁷ The change in the number of severe droughts in 2018 demonstrates areas of significantly increased exposure

in all six WHO regions, with areas of Brazil experiencing a full 12 months of drought throughout 2018.

Indicator 1.2.3: lethality of weather-related disasters—headline finding: a statistically significant long-term upward trend has been observed in the number of flood-related and storm-related disasters in Africa, Asia, and the Americas, since 1990. At the same time, Africa has experienced a statistically significant increase in the number of people affected by these types of disasters

This indicator tracks the number of occurrences of weather-related disasters, the number of people affected, and the lethality of these events. These are formulated as a function of the hazard (magnitude and frequency) and the vulnerability and exposure of populations at risk, using data from the Centre for Research on the Epidemiology of Disasters.⁴⁸ For the 2019 report, disasters have been separated into two categories: flood-related and storm-related disasters; and heatwave, extreme temperature, and drought-related disasters. Details of these methods and data are summarised (appendix pp 10–13).

For heatwaves, extreme temperature, and drought-related disasters, no statistically significant global trend was identified. One explanation for this could be the geographically local nature of such events. However, in the case of floods and storms, a statistically significant trend in occurrence was identified individually across Africa, Asia, and the Americas. A statistically significant increase in the number of people affected by floods and storms in South Africa was also noted, although no statistically significant increase in the lethality of these events was identified.

The relative stability of the lethality and number of people affected by these disasters could possibly be linked to improved disaster preparedness (including improved early warning systems) as well as increased investments in health-care services, and is discussed further in section 2.^{49–51} Importantly, work from the 2015 *Lancet* Commission shows that a business as usual trajectory is

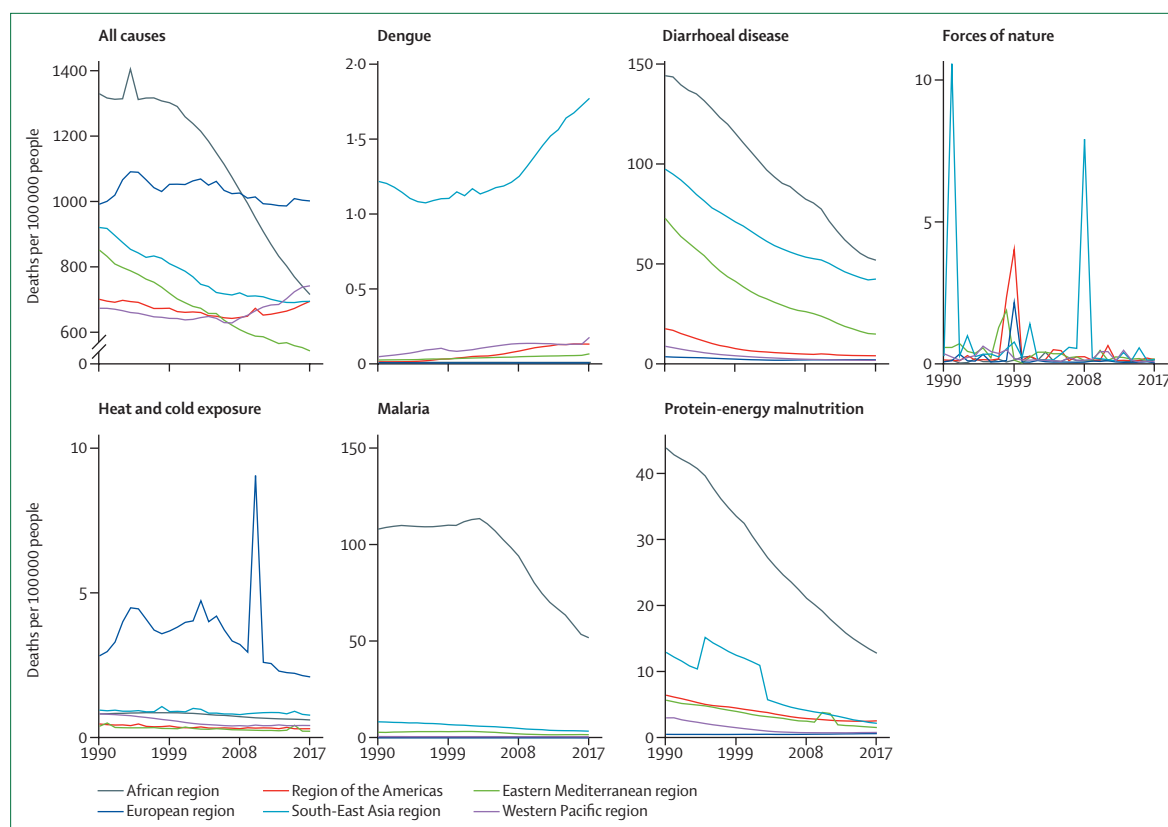

Figure 5: Global trends in all-cause mortality and mortality from selected causes as estimated by the Global Burden of Disease 2017 study⁵² for the 1990–2017 period, by WHO region

expected to result in an additional 2 billion flood-exposure events per year by 2090, which will likely overwhelm health systems and public infrastructure.¹³

Indicator 1.3: global health trends in climate-sensitive diseases

Headline finding: although mortality due to diarrhoeal diseases, malnutrition, and malaria is improving, mortality due to dengue is rising in the regions most affected by these diseases

As described in the preceding indicators, climate change affects a wide range of disease processes. Corresponding health outcomes result from a complex interaction between the direct and indirect effects of climate change and social dynamics, such as population demographics, economic development, and access to health services.¹³ This indicator provides a macro view of these interactions, using GBD data to track mortality from diseases that are sensitive to climate change.⁵² Mortality due to earthquake and volcano events has been removed from the GBD forces of nature category for estimates of weather-related events.

Global trends in climate-sensitive disease mortality from 1990 to 2017 are shown, with all-cause mortality presented as a reference (figure 5). Death from diarrhoeal diseases and protein-energy malnutrition has declined considerably

over this period in regions most affected (Africa, South-East Asia, and Eastern Mediterranean). Similarly, a marked decrease in mortality from malaria since 2000 has been observed in Africa. Socioeconomic development, improved access to health care, and major global health initiatives in sanitation and hygiene, and vector control, have all contributed to these improvements in health outcomes.^{13,53} However, mortality from dengue fever continues to rise, particularly in South-East Asia.

Indicator 1.4: climate-sensitive infectious diseases

Indicator 1.4.1: climate suitability for infectious disease transmission—headline finding: suitability for disease transmission has increased for dengue, malaria, *V. cholerae* and other pathogenic *Vibrio* species. The number of suitable days per year in the Baltic for pathogenic *Vibrio* transmission reached 107 in 2018, the highest since records began, and two times higher than the early 1980s baseline

Climate change affects the distribution and risk of many infectious diseases.⁴⁷ The 2019 *Lancet* Countdown report provides an updated analysis of the environmental suitability for transmission of dengue virus, malaria, and *Vibrio*, with the most recently available data, and presents an additional analysis of *V. cholerae* environmental suitability in coastal areas.

Malaria and dengue fever are endemic in many parts of the world and, as described in the previous indicator, continue to contribute substantially to burden of disease, with young children particularly vulnerable. Suitability for transmission of mosquito-borne infectious diseases is affected by factors including temperature, humidity and precipitation. For dengue, vectorial capacity, which expresses the average daily rate of subsequent cases in a susceptible population resulting from one infected case, is calculated using a formula including the vector to human transmission probability per bite, the human infectious period, the average vector biting rate, the extrinsic incubation period, and the daily survival period.⁵⁴ For malaria, the number of months suitable for transmission of *Plasmodium falciparum* and *P vivax* malaria parasites is calculated on the basis of temperature, precipitation, and humidity. Climate suitability for these mosquito-borne diseases is averaged for the most recent five years for which data is available and compared with a 1950s baseline.

Vibrio species cause a range of human infections, including gastroenteritis, wound infections, septicemia, and cholera. These bacteria are found in brackish marine waters and cases of infections are influenced by sea surface salinity, sea surface temperature, and chlorophyll A concentrations.^{55–57} Climate suitability for *Vibrio* species was estimated on the basis of sea surface salinity and sea surface temperature globally and focally for two regions (the Baltic and US northeast coastlines) where *Vibrio* (excluding *V cholerae*) infections are most frequently observed. For pathogenic *Vibrio* species (excluding *V cholerae*), an average of the 5 most recent years for which data is available is compared with a 1980s baseline, whereas the new *V cholerae* specific analysis compares data from the most recent 3 years with a 2003–05 baseline (based on data availability). Full

details on methods used are presented (appendix pp 14–24).

Climate suitability for transmission is rising for each of the pathogens studied. The second highest vectorial capacity for both dengue vectors was recorded in 2017, with the 2012–17 average 7·2% and 9·8% above baseline for *Aedes aegypti* and *Aedes albopictus*, respectively (figure 6). This change emphasises the continued upward trend of climate suitability for transmission of dengue, with 9 of the 10 most suitable years occurring since the year 2000. Malaria suitability continues to increase in highland areas of Africa, with the 2012–17 average 29·9% above baseline. The percentage of coastal area suitable for *Vibrio* infections from 2010 has increased at northern latitudes (40–70° N) by 3·8%, compared with the 1980s baseline, with 2018 the second most suitable year on record (5% above the baseline; figure 7). The area of coastline suitable for *Vibrio* has increased by 31% in the Baltic coastline and 29% in the northeastern coastline of the USA. Additionally, the number of days per year suitable for *Vibrio* in the Baltic reached 107 in 2018, which is double that of the early 1980s baseline and the highest on record. Globally, environmental suitability for coastal *V cholerae sensu lato* has increased by 9·9%, driven by regional increases in Asia, Europe, the Middle East, North America, and northern and western Africa.

Indicator 1.4.2: vulnerability to mosquito-borne diseases—
headline finding: climate change induced risk of
mosquito-borne diseases could be offset by improvements in
public health systems. Investments in public health have
resulted in a 31% fall in global vulnerability observed from
2010–17. However, this success is not spread equally,
with vulnerability to recurrent dengue outbreaks increasing in
the Western Pacific and South-East Asia over the same period
While the previous indicator describes the influence of climate over the transmission of several infectious diseases, this indicator tracks vulnerability to one of these (dengue). Importantly, population vulnerability to dengue is modulated by human, social, financial, and physical factors, as well as the adaptive capacity of a community.^{53,58}

Country-level data relating to surveillance, preparedness, and response from WHO International Health Regulations' (IHR) core capacities for the years 2010–17,⁵⁹ are used as a proxy for adaptive capacity. *Aedes aegypti* vulnerability is defined by abundance and vectorial capacity as described in indicator 1.4.1. This index estimates the population-level risk of exposure to *Aedes* mosquitoes, accounting for the public health core capacity to cope with the potential effects. A full description of the methods used is provided (appendix pp 24–25).

A contraction of the vulnerability to dengue is observed from 2010 to 2017 in tropical and sub-tropical areas of South America, Africa, and Asia. However, this decrease

Figure 6: Changes in global vectorial capacity for the dengue virus vectors *Aedes aegypti* and *Aedes albopictus* since 1950

Figure 7: Change in suitability for pathogenic *Vibrio* outbreaks as a result of changing sea surface salinity and sea surface temperatures

in vulnerability has levelled off since 2014, with a reversing trend in the Western Pacific and South-East Asia regions.

Indicator 1.5: food security and undernutrition

Indicator 1.5.1: terrestrial food security and undernutrition—headline finding: data from all major crops tracked—maize, wheat, rice, and soybean—showed that increases in temperature have reduced global crop yield potential

Currently, improvements in nutrient and water management, as well as expansion of agricultural areas in lower income countries, are resulting in increases in global food production.^{60,61} However, the number of undernourished people worldwide appears to have been increasing since 2014, driven by challenges to access, availability, and affordability of food.⁶² Undernutrition overwhelmingly affects children younger than age 5 years, causing intrauterine growth restriction, stunting, severe wasting, micronutrient deficiencies, and poor breast-feeding.⁶³ Evidence suggests that crop production is threatened in complex ways by changes in the incidence of pests and pathogens;⁶⁴ increasing water scarcity;⁶⁵ and increases in frequency and strength of extreme weather conditions that can damage or even wipe out harvests.⁶⁶

Change in crop growth duration is used as a proxy for yield potential for maize, wheat, rice and soybean, and is based on the time taken in a year to accumulate a reference period (1981–2010) accumulated thermal time. A reduction in crop growth duration means the crop matures too quickly with lower seed yield.⁶⁷ This methodology is discussed alongside a full description of the Climatic Research Unit database used (appendix p 26).⁴⁵

Globally, crop yield potential for maize, winter wheat, and soybean has reduced in concert with increases in temperature (figure 8), challenging efforts to achieve SDG 2 to end hunger by 2030.⁶⁶ This data resonates with a meta-analysis of the literature by Zhao and colleagues,⁶⁸ which suggests that global yields of these four key crops are reduced respectively by 6%, 3·2%, 7·4%, and 3·1%, globally for each 1°C increase in global mean temperatures.

Indicator 1.5.2: marine food security and undernutrition—headline finding: between 2003 and 2018, sea surface temperature rose in 34 of 64 investigated territorial waters, presenting risk to marine food security

Fish provide almost 20% of animal protein intake to 3·2 billion people, with a greater reliance on fish sources of protein in low-income and middle-income countries, particularly small island developing states.⁶⁹ Climate change threatens fisheries and aquaculture in a number of ways, including through sea surface temperature rise; change in intensity, frequency, and seasonality of extreme events; sea level rise; and ocean acidification.⁷⁰ Acute disturbances such as thermal stress lead to impaired recovery of the coral reefs, which threatens marine fish populations and subsequently marine primary productivity—a key source of omega-3 fatty acids for many populations.⁷¹

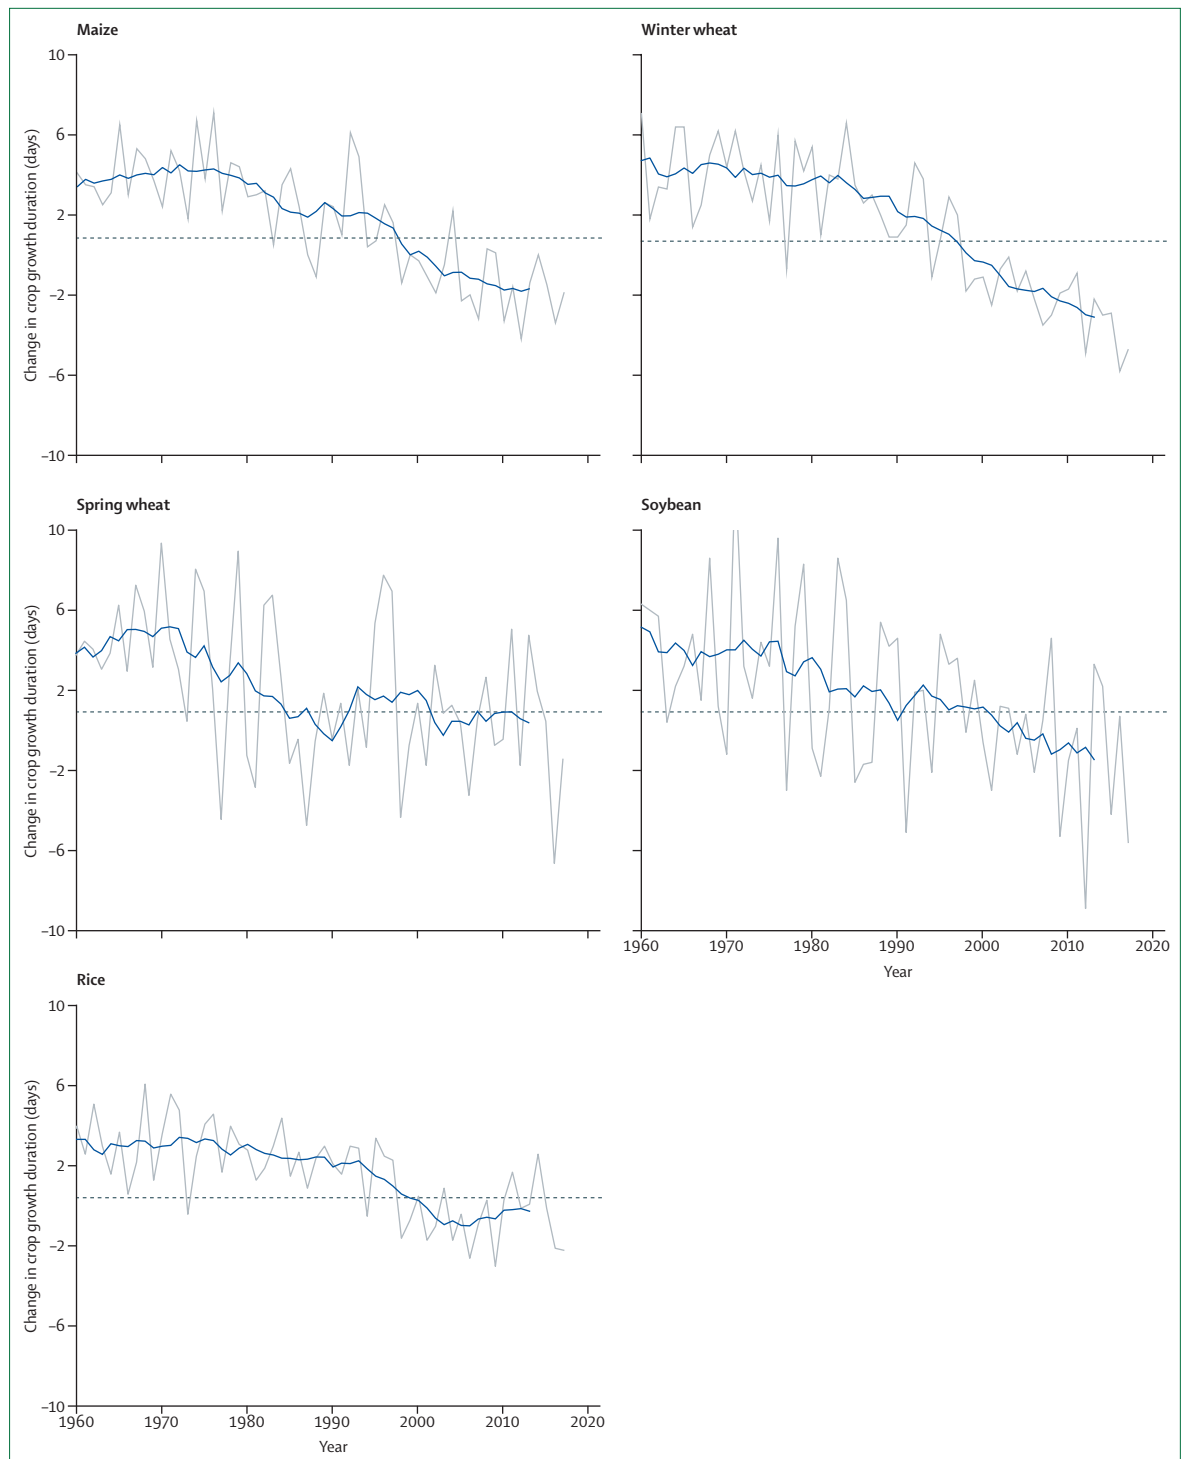

Figure 8: Change in global crop growth duration as a proxy for crop yield

Dashed line=the average change in crop duration of the 1981–2010 baseline. Grey line=annual global area-weighted change. Blue line=running mean over 11 years (5 years forward, 5 years backward).

This indicator tracks sea surface temperature in territorial waters, selected for their geographical coverage and importance to marine food security, using data

sourced from Food and Agriculture Organization of the UN (FAO), NASA, and National Oceanic and Atmospheric Administration.^{72–74} Following a period of development,

this indicator now includes 64 territorial waters (including countries for which data is available) located in 16 FAO fishing areas, and is complemented by monitoring of coral bleaching due to thermal stress (abiotic indicators), and per-capita capture-based fish consumption (biotic indicator; appendix pp 27–47). Between 2003 and 2018, sea surface temperature has risen in 34 of the 64 territorial waters, with a maximum increase of 3.5°C observed in Finland.

Conclusion

The indicators presented in this section provide evidence of the exposures, vulnerabilities, and impacts of climate change on health. They show worsening exposures and vulnerabilities along a range of temperature and precipitation pathways, with reductions in crop yield potentials, and increases in vectorial capacity for a number of climate-sensitive diseases. These effects are felt most acutely by low-income and middle-income countries across the world.

Continued work on attribution remains an important consideration with regards to outcome. For example, migration was addressed in earlier reports, in which questions of attribution to climate change remained particularly challenging.^{20,37} Irrespective of how climate change migrants are counted,⁷⁵ many factors contribute to health risks faced by migration. Resulting health impacts depend on both pre-existing conditions (eg, mental health and nutritional status, desire to migrate, and existing health systems) along with interventions (eg, health-care access, provision of food and shelter, and changing health-related resources).

Similarly, in 2018, the links between climate change and mental health were presented.³⁷ Mental health might be negatively affected in various ways by heatwaves, loss of property, and loss of livelihoods due to floods, or climate-induced migration. However, although many varied links have been identified between climate and mental health, they are highly socially and culturally mediated. Attempting to operationalise these linkages as a single-number indicator—linking climate change and mental health outcomes—remains elusive, yet quantifying these effects is of clear importance.⁷⁶

Section 2: adaptation, planning, and resilience for health

As knowledge of the health consequences of climate change increases, so too does the urgent need to increase efforts to protect people from adverse effects, particularly given the slow progress of mitigation of these effects. Health systems will be placed under increasing and overwhelming pressure, and adaptation to climate change is essential, even with the most ambitious mitigation efforts.⁵⁸ An adaptation gap is apparent, emphasised in some of the aforementioned impacts, and the rapid introduction of adaptation initiatives with better development strategies and funding across all sectors is necessary to

close this divide. The health sector was selected as one of the top three priority areas for adaptation in an analysis of Intended Nationally Determined Contributions prepared for the Paris Agreement.⁷⁷

By their very nature, adaptation and resilience measures are local and specific to regional hazards and underlying population health needs. Identifying readily available global metrics, with adequate data and proximity to climate change and to health adaptation, is particularly challenging.^{78–80} Additionally, evaluating the success of any intervention is difficult, given that the goals of adaptation are inherently long-term, and no counterfactual is readily available. Rising to this challenge, the work in this section has expanded, from the initial three indicators proposed in 2016,¹⁹ to the eight presented here. The structure of these indicators, and this section, builds on the WHO Operational Framework for building climate resilient health systems,⁸¹ monitoring progress across the following selected domains: adaptation planning and assessment (indicators 2.1.1, 2.1.2, and 2.1.3), adaptive information systems (indicator 2.2), adaptation delivery and implementation (indicators 2.3.1 and 2.3.2), and adaptation financing (indicator 2.4.1).

True to an iterative approach, many indicators have been further developed. For the indicators evaluating national health adaptation planning and vulnerability mapping (indicators 2.1.1 and 2.1.2), the number of country respondents has increased from 40 to 101. Additional information on implementation and government funding is included alongside qualitative analysis, which was undertaken as part of the validation of the self-reported data. A new indicator has been added, focusing on air conditioning use as an adaptive measure to heat mortality (indicator 2.3.2). This is the first of a new suite of indicators under development, which monitor adaptation to a specific exposure pathway, complementing existing work on health adaptation efforts.

Several indicators in this section rely on self-reported data in surveys of national and subnational governments to track health adaptation, with clear strengths and limitations to this approach. Self-reported survey data is subject to response and non-response error, with local verification difficult;⁷⁹ however, the datasets here—from the WHO and the Carbon Disclosure Project (CDP)—provide the best available information on national-level and city-level specific health adaptation measures, globally. Further information on the validation techniques of the national data is summarised (appendix pp 48–49).

Indicator 2.1: adaptation planning and assessment

Indicator 2.1.1: national adaptation plans for health—headline finding: recognition of the need for health adaptation to climate change is widespread, and development planning is underway. In 2018, almost half of the countries surveyed declared that a national health and climate change plan was in place

Over the past decade, a steady increase in countries scaling up health adaptation projects to build climate

Figure 9: Number of countries with a national health and climate change plan or strategy

Data from 101 country respondents of the 2018 WHO Health and Climate Change Country Survey,⁸³ by permission of the World Health Organization.

resilience has been observed.⁸² This indicator, based on data from the 2018 WHO Health and Climate Change Country Survey,⁸³ tracks the number of countries that have a national health and climate change plan or strategy, current levels of their implementation, and the commitment of national health funds for achieving the health adaptation and mitigation priorities outlined by governments in these documents. Importantly, the country response rate has more than doubled, with 101 of the 194 Member States reporting in the 2018 survey compared with 40 reporting in the 2015 survey presented in earlier *Lancet* Countdown reports.²⁰

Global coverage of national adaptation plans for health is growing, with 51 of 101 countries now having a national health and climate change plan in place. Just over half of these countries report at least a moderate level of implementation of their plans; however, challenges to full implementation remain, with less than 20% of countries reporting actions underway or plans in place to address most of their key priorities (figure 9). National funding for implementation of health and climate change plans was identified as a central constraint with fewer than 4 in 10 countries reporting at least partial funding for the implementation of their main health adaptation and mitigation priorities.

A further analysis of approximately 40 strategies or plans, collected as part of the survey, emphasises that the comprehensiveness and scope of the national health and climate strategies or plans varied widely, with only a small number of plans directly linked to the National Adaptation Plan (NAP) process as part of the UN Framework Convention on Climate Change (UNFCCC). About 30% of the national health and climate change plans were published more than 5 years ago. Opportunities exist in national health and climate planning to update and expand the comprehensiveness of plans and for these to be developed into health components of NAP,⁸¹ thereby anchoring health within national climate processes and potentially strengthening access to international climate finance for health adaptation.

Indicator 2.1.2: national assessments of climate change impacts, vulnerability, and adaptation for health—headline finding: of 101 countries surveyed in 2018, 48 indicated that a national assessment of health vulnerability to climate change had been done. However, of these 48 countries, just over 40% reported that assessment findings had influenced the allocation of human and financial resources

An adequate health adaptation response requires an assessment of the vulnerability of populations to different kinds of health effects, an assessment of local geographical and meteorological trends, and assessment of the corresponding capacity of health services. A health vulnerability and adaptation assessment serves as a baseline analysis, against which changes in disease risks and protective measures can be monitored, and strengthens the case for investment in health protection.⁸⁴ Data for this indicator is sourced from the 2018 WHO Health and Climate Change Country Survey.⁸³ Additional information on the survey methods and data is presented (appendix pp 49).

An increasing number of countries are implementing national vulnerability and adaptation assessments, with most countries indicating that these assessments are having at least some influence over policy prioritisation. However, translating evidence into funding decisions remains an issue, with only 40% of countries reporting that resource allocation is guided by evidence generated from vulnerability and adaptation assessments for health.

Indicator 2.1.3: city-level climate change risk assessments—headline finding: in 2018, 54% of global cities surveyed expected climate change to seriously compromise their public health infrastructure, with 69% of cities actively developing or having completed a comprehensive climate change risk or vulnerability assessment

The effects of climate change are experienced locally, with cities and local governments forming a crucial component of any health adaptation response. For this indicator, The *Lancet* Countdown works with the CDP to include data from their annual global survey of cities.⁸⁵ Two components of this data are analysed: the number of global cities that have undertaken a city-wide climate change risk or vulnerability assessment; and their perceived vulnerability to climate change of critical health infrastructure. In 2018, 489 cities participated in the survey, with 297 (61%) from high-income countries.

Just over half (52%) of all responding cities have undertaken an assessment and about a quarter either have an assessment in progress (17%) or intend to undertake an assessment in the future (7%). These values represent a small, but steady increase from 2017.³⁷ The health impacts of climate change are of increasing concern for cities, with 54% of responding cities noting that critical assets or services related to public health would be affected by climate change, compared with 51% in 2017.³⁷

Indicator 2.2: climate information services for health

Headline finding: progress has been observed in the number of countries providing climate services to the health sector, increasing from 55 in 2018 to 70 in 2019

Meteorological and hydrological services should work with health services to monitor and prepare for the climate-related risks to health tracked in section 1.⁸¹ This indicator tracks national climate information services for health, which help monitor and prepare for climate-related health risks, using data reported by national meteorological and hydrological services to the World Meteorological Organization (WMO) Country Profile Database integrated questionnaire.

70 national meteorological and hydrological services of WMO Member States reported providing climate services to the health sector, 15 more than reported in the 2018 *Lancet* Countdown report.³⁷ Of these, 18 were from Africa, 5 from the Eastern Mediterranean, 22 from Europe, 13 from the Americas, 4 from South-East Asia, and 8 from the Western Pacific. Additional detail was provided by 47 respondents, with several services working with the health sector and creating products accessible to the health sector. However, although climate services can be used for health in a range of ways, including monitoring, provision of early warning systems, and forecasting of environmental risks, application of these services to policy making remains low, with only 4 of the 47 Member States reporting that climate services are guiding health sector policy decisions and investment plans.

Indicator 2.3: adaptation delivery and implementation

Indicator 2.3.1: detection, preparedness, and response to health emergencies—headline finding: 109 countries have medium to high implementation of a national health emergency framework in place, in preparation for all public health events and emergencies

The IHR are an international legal instrument aimed at helping the global community prevent and respond to acute public health risks.⁵⁹ Countries are assessed through a set of core capacities, reported in an annual survey of State Parties. The survey was initially a yes or no questionnaire from 2010, and in 2018 was updated to a more detailed tool that assesses the degree of implementation of each of the core capacities (appendix pp 53–61). Capacity 8 (C8) of the IHR focuses on countries' national health emergency framework, which applies to all public health events and emergencies, covering disease outbreaks, air pollution, extreme temperatures, droughts, floods, and storms, as well as societal hazards (such as conflict and financial crisis). The survey encompasses three components: planning for emergency preparedness and response mechanism; management of health emergency response operations; and emergency resource mobilisation.⁸⁶

In 2018, 182 WHO Member States completed the survey relating to C8. Of these, 109 countries had medium to high implementation of the three

Figure 10: Global proportion of households with air conditioning (red line), prevented fraction of heatwave-related mortality due to air conditioning (blue line), and CO₂ emissions from air conditioning (green line) 2000–16
CO₂=carbon dioxide.

components for this core capacity. However, the degree of implementation varied greatly by region, with Africa reporting having achieved 21·3% and Europe having achieved 75·5% medium to high implementation of the framework, corresponding to an average score of the three C8 components of 50–74% and 75–100%.

Indicator 2.3.2: benefits and harms of air conditioning—headline finding: use of air conditioning as an adaptation measure is a double-edged sword: on the one hand, global air conditioning use in 2016 was estimated to reduce heatwave-related mortality by 23% compared with the complete absence of air conditioning; on the other hand, it also confers harms, by contributing to climate change, worsening air pollution, substantially adding to peak electricity demand on hot days, and enhancing the urban heat island effect

Indoor cooling is an important adaptation to extreme heat, with air conditioning emerging as a primary mechanism. Access to household air conditioning is highly protective against heatwave-related mortality,⁸⁷ however, it is also associated with substantial indirect harms. On hot days in locations with high air conditioning prevalence, this can account for more than half of peak electricity demand⁸⁸ which, if sourced from fossil fuels, contributes to both CO₂ and particulate matter (PM)_{2.5} emissions. Additionally, waste heat from air conditioning can paradoxically increase external night temperatures by more than 1°C.⁸⁹ Hydrofluorocarbon refrigerants used for air conditioning can escape into the atmosphere where they act as powerful greenhouse gases. In baseline scenarios, these hydrofluorocarbon emissions will increase to 1–2 gigatons of CO₂ equivalent (GtCO₂e) per year by 2050.^{90,91} Consequently, a nuanced approach to heat adaptation must be deployed, which protects vulnerable populations

across the world from heat-related morbidity and mortality, while minimising the health-associated harms of air pollution, the urban heat island effect, and contribution to climate change.

This new indicator includes four components: the proportion of households using air conditioning; the prevented fraction of heatwave-related mortality attributable to air conditioning use; CO₂ emissions attributable to air conditioning use; and premature mortality from air conditioning attributable to PM_{2.5}. Unpublished data for household air conditioning use, electricity consumption, and CO₂ emissions was provided by the International Energy Agency (IEA).

The prevented fraction,⁹² (the percent reduction in heatwave-related deaths due to a given proportion of the population having household air conditioning, compared with a complete absence of household air conditioning) was calculated using a relative risk for heatwave-related mortality of 0·23 for having household air conditioning compared with not having household air conditioning,⁸⁷ and the proportion of populations with household air conditioning. The relative risk estimate used for these calculations is based on studies focused on European and US populations, and further research is required to fully understand the effect modification across different contexts.⁸⁷ The air pollution source attribution methods discussed in section 3 (indicator 3.3.2) were used to calculate deaths due to PM_{2.5} emissions from air conditioning.

Between 2000 and 2016, the world's air conditioning stock (residential and commercial) more than doubled to 1·62 billion units and the proportion of households with air conditioning increased from 21% to about 30% (figure 10). In 2016, this proportion was 4% in India, 14% in the EU, 58% in China, and more than 90% in the USA and Japan. Correspondingly, the global prevented fraction of heatwave-related mortality increased from 16% in 2000 to 23% in 2016, ranging from less than 10% in India, Indonesia, and South Africa to more than 66% in the USA, Japan, and Korea.

These trends have also been associated with increased harms. In 2016, air conditioning accounted for 10% of global electricity consumption and 18·5% of electricity used in buildings.⁹³ Under the IEA's baseline scenario, these figures will increase in 2050 to 16% and 30%, respectively.⁹³ Following the trend in the proportion of households with air conditioning, CO₂ emissions from air conditioning use tripled from 0·35 gigatons in 1990 to about 1·1 gigatons in 2016 (figure 10), and are projected to rise to 2 gigatons in 2050 in the IEA's baseline scenario.⁹³ In 2016, the number of premature deaths due to PM_{2.5} exposure attributable to air conditioning was 2480 in India, 2662 in China, 1088 in the EU, and 749 in the USA.

Fortunately, various paths forward provide for adaptation against heat-related mortality for those who need it, without the associated harms of greenhouse gases and PM_{2.5} emissions, excessive electricity demand, and undue contribution to the urban heat island effect. Air conditioning use could be reduced by promoting energy efficient appliances and energy efficient building design through strong, enforced building codes.⁹³ Traditional building designs in tropical and sub-tropical regions reduce thermal stresses by providing shade, thermal mass, insulation, and ventilation.⁹³ Harms associated with air conditioning can be greatly reduced by increasing its efficiency,⁹³ by generating electricity from non-fossil-fuel sources, and by implementing the Kigali Amendment to the Montreal Protocol to phase-down hydrofluorocarbons.⁹⁴

(Figure 11 continues on next page)

Indicator 2.4: spending on adaptation for health and health-related activities

Headline finding: in 2018, global spending on health adaptation to climate change was estimated to be £13 billion (5%) of all adaptation spending, and health-related spending was estimated at £35 billion (13.5%). These estimates represent increases in absolute and relative terms over previous data

A higher demand for health adaptation measures requires increased adaptation funding. This indicator tracks adaptation spending, using 2015–16, 2016–17, and 2017–18 data from the Adaptation and Resilience to Climate Change dataset produced by kMatrix,⁹⁵ as described in the 2017 and 2018 reports.^{20,37} Health adaptation spending is defined as national adaptation spending specifically within the formal health-care sector, whereas health-related adaptation follows adaptation spending for disaster preparedness and agriculture, in addition to health care. Data in this year's indicator covers 191 countries and territories reported in the Adaptation and Resilience to Climate Change dataset. Per-capita values are based on 183 countries with population estimates from the International Monetary Fund (IMF) World Economic Outlook.⁹⁶

Spending on adaptation to climate change in health and health care increased by 11.2% in 2017–18, compared with 2016–17 data. This percentage increase is notably larger than the change in total adaptation spending generally (an increase of 6.5% from 2016–17). At the country level, growth of health adaptation spending ranged from 17.5% (UK) to 10% (Latvia); however, smaller increases and less variation were recorded for health-related values, from 11.1% (UK) to 6.8% (Kazakhstan). Importantly, health still represented a small proportion of the total adaptation spend, having grown from 4.6% in 2015–16 to 5.0% in 2017–18.

Grouped by WHO Region, the highest per-capita spending for 2017–18 is in the Americas (£4.2 for health, £11.2 for health-related spending; figure 11). By contrast, in the African, Eastern Mediterranean, and South-East Asian regions, per-capita health adaptation spending is less than £1.

Conclusion

Although many of the indicators presented in section 2 are moving in a positive direction, the pace of the adaptation response from the health community remains slow. The number of countries with national adaptation plans for health and the number of countries and cities that have assessed health risk and vulnerabilities has increased, along with the spending on health adaptation. Thorough consideration of the best adaptation options is required before implementation. For example, the health benefits of adaptation measures such as air conditioning might be counteracted by harms caused through a contribution to heat generation, climate change, and air pollution (indicator 2.3.2).

Figure 11: Spending on adaptation for health and health-related activities in WHO-specified regions. Graphs show Adaptation to Resilience and Climate Change spending (A) and spending per capita (B).

These findings and those from the UN Environment Adaptation reports show that further work is required globally, both in terms of the planning and implementation of adaptation measures, to improve health.^{97,98}

Section 3: mitigation actions and health co-benefits

As emphasised in section 1, climate change has already impacted human health and requires an urgent response, both in terms of health adaptation (section 2) and importantly, in mitigation, to minimise future effects from climate change.

In keeping with the Paris Agreement's commitment of limiting temperature increase to "well below 2°C", and to pursue the 1.5°C target, global emissions must peak as soon as possible (some studies suggest as early as 2020) and then follow a steep decline to 2050.² However, current mitigation actions and commitments are not consistent with this goal. Total global greenhouse-gas emissions for 2017 were the highest ever recorded, at 53.5 GtCO₂e.⁹⁹ The sum of all nations' current commitments under the Paris Agreement is far from sufficient, with 2030 emissions estimated to be lowered by only 6 GtCO₂e—which is only a half of the reduction required to achieve the 2°C scenario, and a fifth of that necessary to achieve the 1.5°C goal.⁹⁷

Discussions of greenhouse-gas emission reductions must be directly interlinked with any associated potential positive economic and health benefits. Mitigation actions not only improve health in the long term, through minimising climate change, but can also have near-term benefits through numerous pathways such as reductions in risk of respiratory and cardiovascular disease attributable to air pollution,⁸ reductions in the risk of diseases associated with physical inactivity and obesity (because of increased cycling and walking),¹⁰⁰ and a variety of improvements that could result from healthier diets.¹⁰¹

This section of the *Lancet* Countdown 2019 report tracks mitigation and its health consequences in different sectors including: energy (indicators 3.1.1, 3.1.2, 3.2); air pollution (indicators 3.3.1, 3.3.2); transport (indicator 3.4); agriculture (indicator 3.5); and health care (indicator 3.6).

Crucially, two new indicators of great importance to health have been added to the section: emissions attributable to livestock and crops (allowing a more nuanced discussion about the health and climate benefits of reductions in ruminant meat consumption), and emissions from national health-care systems. This section will continue to expand in future years by monitoring mitigation and health co-benefits in other important sectors, including industry, buildings, and land use.

Overall, CO₂ emissions from fossil fuels have risen by 2.6% from 2016 to 2018 (indicator 3.1.1). Concerningly, the previous downward trend in coal supply has reversed, with a 1.7% increase recorded in total primary energy supply from 2016 to 2018 (indicator 3.1.2). However, more encouragingly, growth in renewables continues apace and comprised 45% of total growth in electricity generation. At present, modern renewables represent 5.5% of global electricity generation (indicator 3.1.3), but are predicted to reach 30% by 2023.¹⁰² The implications of maintenance of both of these trends are important for air pollution. A continued demand for fossil fuels and an increase in coal consumption have resulted in the number of deaths attributable to ambient air pollution remaining stagnant (2.9 million deaths in 2016; indicator 3.3.2).

The transport sector is an equally entrenched emitter of greenhouse gases, with emissions and fuel use maintaining a modest growth trajectory of 0.7% per capita CO₂e in 2016. Although use of electric vehicles has increased, they continue to represent a small proportion of the global vehicles worldwide. Yet, countries such as China have positioned electric vehicles as the future of driving with electricity in transport, with 21.4% growth in per capita usage from 2015 to 2016, rising from 1.5% to 1.8% of total fuel use (indicator 3.4).

Feeding the global population is a crucially important aspect of health and wellbeing along with ensuring economic stability and security. However, the agriculture and food sector are both energy and carbon intense and an important area for climate change mitigation. Global agricultural greenhouse-gas emissions (indicator 3.5) have increased between 2000 and 2016 by 14% for livestock and 10% for crops.

As outlined in sections 1 and 2, the health sector is on the frontline of climate change and plays a vital role in any response. This sector is also a major contributor of greenhouse-gas emissions (indicator 3.6), with global estimates as high as 4.6% of global emissions in 2016.

Indicator 3.1: emissions from the energy system

Indicator 3.1.1: carbon intensity of the energy system—headline finding: in 2018, the carbon intensity of the energy system remained unchanged from 1990. However, greenhouse-gas emissions from fossil fuel combustion have returned to a growth trajectory, rising by 2.6% from 2016 to 2018. Limiting warming to 1.5°C would require a 7.4% year-on-year reduction from 2019 to 2050

In the 2019 *Lancet* Countdown report, this indicator includes data up to 2016, supplemented with additional statistics for global CO₂ emissions from energy combustion for 2017¹⁰³ and 2018.¹⁰⁴ It tracks the carbon intensity of the energy system, monitoring the CO₂ emitted per terajoule of total primary energy supply (TPES). TPES reflects the total amount of primary energy used in a specific country, accounting for the flow of energy imports and exports. Key improvements in this analysis are seen in the disaggregation of fuel type, the extension of data from 1970, and the inclusion of new projections forward to 2050. A full description of data and methods is provided (appendix pp 68–69).

Global emissions of CO₂ from fossil fuel combustion, having been flat between 2014–16, have increased to a new high of 33.1 GtCO₂ in 2018 (figure 12).¹⁰⁴ This 2.6% increase over the past two years has resulted from continued growth in energy demand—energy mostly from fossil fuels.

The carbon intensity of the energy system will need to reduce to near zero by 2050. Over the past 15 years, carbon intensity has largely plateaued, as the growth of low-carbon energy has been insufficient to displace fossil fuels. However, IEA data suggest that carbon intensity could be starting to reduce, with gas slowly displacing coal (figure 12).¹⁰⁴

Figure 12: Carbon intensity of TPES for selected regions and countries, and global energy-related CO₂ emissions

Carbon intensity is shown by lines (primary axis) and global emissions by stacked bars (secondary axis). CO₂=carbon dioxide. tCO₂/TJ=total CO₂ per terajoule of energy. TPES=Total Primary Energy Supply.

Indicator 3.1.2: coal phase-out—headline finding: TPES from coal increased by 1.7% from 2016 to 2018, driven by growth in China and other countries in Asia

Coal phase-out is essential, not only as a key measure to mitigate climate change, but also to reduce morbidity and mortality from air pollution.⁸ As of December, 2018, 30 national governments, along with many sub-national governments and businesses, have committed to coal phase-out for power generation through the Powering Past Coal Alliance.¹⁰⁵ In this year's *Lancet* Countdown report, this indicator tracks TPES from coal, plus projections for coal phase-out, using the scenarios that informed the IPCC Special Report on Global Warming of 1.5°C.²

Coal has returned to a growth trajectory from 2016 to 2018 (figure 13); however, because of the overall growth in global energy demand, the share of coal in primary energy supply continues to fall (appendix pp 70–73). Coal continues to be the second largest contributor to global primary energy supply (after oil) and the largest source of electricity generation (at 38%, compared with gas, the next highest at 23%). Most of the growth in TPES of coal has been in Asia, notably China, India, and southeast Asia.

Rapidly decreasing coal use to zero is crucial to meeting the commitments of the Paris Agreement. For example, no less than an 80% reduction in coal use from 2017 to 2050 (a 5.6% annual reduction rate) is consistent with a 1.5°C trajectory (appendix pp 70–73). However,

given that the technology to support coal phase-out exists, a more rapid reduction rate is probably feasible.

Indicator 3.1.3: low-carbon emission electricity—headline finding: in 2018, renewable energy continues to account for a large share (45%) of growth in electricity generation, with 27% of growth from wind and solar sources

With the power generation sector accounting for 38% of total energy-related CO₂ emissions, the displacement of fossil fuels with renewable energy sources is of crucial importance. This indicator tracks total low carbon electricity generation (which includes nuclear sources and all renewables, including hydro) and new renewable electricity generation (excluding hydro), using the World Extended Energy Balances dataset from the IEA.¹⁰⁴ Renewable electricity generation was also projected using the scenarios that informed the IPCC Special Report on Global Warming of 1.5°C.² A full description of the datasets, methods, and projections is presented (appendix pp 73–75).

In 2016, low-carbon electricity globally accounted for 32% of total global electricity generation (figure 14). Promisingly, renewable energy accounted for 45% of growth in electricity generation in 2018,¹⁰⁶ and solar generation continues to grow at an unprecedented rate of around 30% per annum (but still only accounting for 2% of total global generation).¹⁰⁷

An assessment of scenarios compliant with the 1.5°C goal emphasises that generation from new renewable

Figure 13: TPES coal in selected countries and regions, and global TPES coal

Regional primary energy supply of coal is shown by the trend lines (primary axis) and total global supply by the bars (secondary axis). EJ=exajoule. TPES=Total Primary Energy Supply.

sources (solar, wind, geothermal, wave and tidal) need to increase by 9.7% per annum, so that generation in 2050 is larger than total global electricity use today. Since 1990, the annual growth rate for these renewable sources was more than 14%, a very promising trend, but one that must be maintained for a further three decades.

Indicator 3.2: access and use of clean energy

Headline finding: almost 3 billion people live without access to clean fuels and technologies for cooking, and only 7.5% of households in low-income countries report using such fuels

Globally, 3.8 million deaths per year are estimated to be attributable to household air pollution,¹⁰⁸ largely arising from use of solid fuels, such as coal, wood, charcoal, and biomass, for cooking. Efforts to provide clean cooking and heating technologies could result in substantial health co-benefits in addition to reducing greenhouse-gas emissions and short-lived climate pollutants.^{108–111} Additionally, universal access to affordable, reliable, sustainable, and modern energy for all is a key determinant of economic and social development and is central to health and wellbeing.^{112,113}

This indicator combines both a top-down and bottom-up approach from IEA and WHO datasets, capturing total household energy use and household fuel use for cooking, respectively.^{114,115} The new data on household clean fuel use represents an impressive effort from WHO, combining the results of thousands of national household surveys done across three decades and in more than 140 countries.

Details of the methods, definitions, and data for this indicator are presented (appendix pp 75–76).

Use of clean fuels and technologies for cooking for 2015–17 remained low, at 7.5% in households in low-income countries, and 40% in households in lower middle-income countries (figure 15). These data reflect a slow improvement in global access to clean cooking fuels and technologies, which has increased by just 1% since 2010, with almost 3 billion people remaining in access-deficit.¹¹⁶

Concerningly, although access to electricity has risen from 83% in 2010 to 87% in 2016, residential clean energy usage—which, at point of demand, includes electricity of all sources, solar thermal and geothermal—remains low. In 2016, the global proportion of clean energy use in the residential sector was approximately 24%, an increase from 17% recorded in 2010.¹¹⁴ Solid biomass, which contributes to respiratory and cardiovascular diseases attributable to household air pollution,¹¹⁷ is currently estimated to account for 36% of total residential sector energy use.

Future forms of this indicator will work to link residential energy and fuel use to household air pollution morbidity and mortality across the world. One possible approach to achieving this linkage is presented, discussing slum housing in Viwandani in Nairobi, Kenya (panel 2).

Indicator 3.3: air pollution, transport, and energy

Exposure to ambient air pollution, most importantly fine particulate matter (PM_{2.5}), constitutes the largest

Figure 14: Renewable and low-carbon emission electricity generation

(A) Electricity generated from low-carbon sources. (B) Share of electricity generated from low-carbon sources. (C) Electricity generated from renewable sources (excluding hydropower). (D) Share of electricity generated from renewable sources (excluding hydropower). TWh=terawatt hours.

global environmental risk factor for premature mortality, and results in several million premature deaths from cardiovascular and respiratory diseases every year.^{8,123,124} More than 90% of children are exposed to $PM_{2.5}$ concentrations that are above the WHO guidelines,¹²⁵ which can affect their health throughout their life, with an increased risk of lung damage, impaired lung growth and pneumonia, and a subsequent risk of developing asthma and chronic obstructive pulmonary disease.¹²⁶ Most of the exposure to $PM_{2.5}$ results from anthropogenic activities, and much of this is associated with combustion of coal and other fossil fuels for electricity generation, industrial production, transport, and household heating and cooking; therefore, $PM_{2.5}$ emissions share many of the same sources as greenhouse-gas emissions.¹²⁷

Indicators 3.3.1 and 3.3.2 report on source contributions to ambient air pollution and its health effects, drawing from the GAINS model,¹²⁸ which calculates emissions of all precursors of $PM_{2.5}$ by use of a detailed

Figure 15: Graph showing proportion of households cooking with clean fuels in World Bank grouped low-income and middle-income countries

Panel 2: Case study of household air pollution conditions in Nairobi, Kenya

This case study focuses on indoor exposure to fine particulate matter (PM)_{2.5}, the mortality attributable to this exposure, and carbon dioxide equivalent (CO₂e) emissions in slum housing in Viwandani, Nairobi, Kenya. In this setting, cooking is done with solid fuels (14.6%), kerosene (72.9%), or electricity (12.5%). Most dwellings do not have space heating (84.6%), with the rest using solid fuel heaters from June to August. Houses without electricity use kerosene-burning koroboi lamps for lighting for the whole year, and 8 h average ambient outdoor pollution levels are around 67 µg/m³.¹¹⁸

Indoor exposure and space heating estimates were estimated on the basis of 2016 levels using EnergyPlus,¹¹⁹ calibrated to monitored indoor levels in dwellings using different fuel types and ventilation behaviours.¹²⁰ Two scenarios were modelled, involving the following changes in exposure and heating energy consumption.

The first scenario modelled electrification of all existing stoves, lamps, and heaters using the standard electrical network, which was assumed to reduce outdoor pollution by 40% on the basis of the estimated contribution of residential combustion to annual mean air pollution in Nairobi from the GAINS model.¹²¹

The second scenario modelled electrification as in the first scenario, but with low energy lighting, and heater installation

extended to all dwellings. Additionally, upgrades to dwelling energy efficiency and airtightness inline with local sustainable design guidelines were modelled.¹²²

Current mean 24-hour exposures in Viwandani are estimated to average 60 µg/m³ with the fuels producing an estimated 425 kg of CO₂e per household year. Electrification was estimated to result in halving of both greenhouse-gas emissions and PM_{2.5} air pollution (and hence premature deaths associated with PM_{2.5}), with annual greenhouse-gas emissions reduced to 210 kg of CO₂e per year and an annual average PM_{2.5} concentration of 31 µg/m³. For upgrades to the building envelope and increased electric heating and lighting coverage, the decrease in CO₂e emissions was similar to that for electrification, but with a substantially greater reduction in PM_{2.5} concentrations down to an annual average of 25 µg/m³, and hence a reduction in premature deaths associated with air pollution. However, these changes do not reduce indoor exposures to less than the WHO-recommended limit of 10 µg/m³. Therefore, reduction of indoor PM_{2.5} to adequate and safe concentrations would also necessitate further substantial reductions in outdoor ambient levels or the application of additional technologies such as air filtration systems.

breakdown of economic sectors and fuels used. Underlying activity data are based on statistics reported by the IEA.¹²⁹

Indicator 3.3.1: exposure to air pollution in cities—headline finding: urban citizens have continued exposure to high levels of air pollution, with 83% of cities exceeding the WHO's recommended safe concentrations. Energy use, particularly residential combustion, is a major contributor to this pollution

The world is becoming increasingly urbanised, with almost 70% urbanisation of the global population expected by 2050.¹³⁰ Because of the increased population and higher concentrations of emissions, many cities have become hot spots of air pollution. Few cities worldwide have achieved PM_{2.5} concentrations that are below the WHO guideline of an annual mean of 10 µg/m³, and many cities exceed this guideline amount several-fold.¹³¹ The highest measured concentrations currently have been reported in south and east Asia, while data gaps exist in other world regions. The fact that these high PM_{2.5} concentrations have been further increasing or stagnant in many regions of the developing world is particularly concerning. A positive exception to this trend is China, where many highly polluted cities have improved air quality because of their ambitious emission control efforts. Cities in Europe and the USA have seen slowly decreasing PM_{2.5} concentrations with effective implementation of air pollution control legislation and regulation.

This analysis estimates source contributions to ambient PM_{2.5} concentrations in urban areas outside Europe (more than 3500 cities with more than 100 000 inhabitants), with results aggregated to the WHO world regions—83% of these cities do not meet the WHO guideline regarding ambient PM_{2.5} concentrations.

In most regions, residential combustion of solid fuels for cooking and heating was the dominant source of high PM_{2.5} concentrations in 2016. Although coal is prominent in some countries, most of the burden arises from the use of biomass in traditional stoves, which is often associated with net greenhouse-gas emissions due to unsustainable harvesting.

Indicator 3.3.2: premature mortality from ambient air pollution—headline finding: in 2016 there were 2.9 million premature deaths globally that were associated with ambient PM_{2.5} pollution, with minimal improvement in global mortality from 2015. On a decadal scale, improvements are seen in some regions because of efficient emission controls, particularly from industrial processes and power generation

Knowledge of the sources of ambient air pollution is essential for designing efficient mitigation measures that maximise benefits for human health and climate. This indicator estimates the source contributions to ambient PM_{2.5} and their global health impacts, quantifying contributions from individual economic sectors and assessing coal combustion across sectors.

Figure 16: Premature deaths attributable to exposure to ambient fine particulate matter (PM_{2.5}) in 2015 and 2016, by key sources of pollution in WHO-specified regions

PM_{2.5}=atmospheric particulate matter with a diameter of less than 2.5 µm.

Results for 2016 are similar to the estimates for 2015, with an overall number of premature deaths attributable to ambient PM_{2.5} estimated at 2.9 million. The dominant contribution varies between and within world regions: in Africa, household cooking primarily contributes to high PM_{2.5} concentrations; whereas in other regions, industry, transport, electricity generation, and agriculture are the primary contributors (figure 16). Small decreases in the number of premature deaths have been observed in the European region and the Western Pacific region (mainly from closing of coal power plants). Sustained improvements over the past 10 years have been recorded in these regions, presumably due to implementation of end-of-pipe emission controls on power plants (Western Pacific) and on other emission sectors in Europe. However, worldwide, more than 440 000 premature deaths are still estimated to be associated with coal burning.

Indicator 3.4: sustainable and healthy transport

Headline finding: global road transport fuel use increased by 0.7% from 2015 to 2016 on a per-capita basis. Fossil fuels continue to dominate as the primary transport fuel, but their growth is being tempered somewhat by rapid increases in biofuels and electricity

As with electricity generation, the transition to cleaner fuels for transport is important for climate change mitigation and will have the added benefit of reducing mortality from air pollution.¹⁰⁰ Fuels used for transport currently produce more than half of the nitrogen oxides emitted globally and a substantial proportion of particulate matter, posing a large threat to human health, particularly in urban areas (indicator 3.3).¹³² Additionally, the health benefits of increasing uptake of active forms of travel (walking and cycling) have been shown through a large number of epidemiological and modelling analyses.^{17,49,100,133,134} Encouraging active travel (particularly cycling) has become increasingly central to transport planning, and growing evidence suggests that bikeway

Figure 17: Per-capita fuel use by type (TJ per capita) for road transport

(A) Global per-capita fuel consumption for road transport using all types of fuels. (B) Global per-capita fuel consumption for road transport using biofuels and electricity.

Figure 18: Gigaton CO₂e emissions from 2000 to 2016

(A) CO₂e emissions from livestock. (B) CO₂e emissions from crop production. CO₂e=carbon dioxide equivalent.

infrastructure, if appropriately designed and implemented, can increase cycling in various settings.¹³⁵ A modal shift in transport could also result in reductions in air pollution from tyre, brake, and road surface wear, in addition to a reduction in exhaust-related particulates.¹³⁶

Global trends in fuel efficiency and the transition away from the most polluting and carbon-intensive transport fuels are monitored using data from the IEA; specifically, it follows the metric of fuel use for road transportation on a per-capita basis (TJ/person) by type of fuel.^{37,137} In response to feedback, this year's indicator displays data in three categories of fuel: fossil fuels, biofuels, and electricity.

Globally, per-capita fuel use increased by 0.7% from 2015 to 2016 (figure 17). Although fossil fuels continue to contribute 95.8% of total fuel use for road transport, the use of clean fuels is growing at an increasing rate: fossil fuel use increased by 0.5%, compared with 3.3% growth

in use of biofuels and 20.6% growth in use of electricity. In China, electricity now represents 1.8% of total transportation fuel use. This is more than any other country and an 80% higher share than observed in Norway (0.85%), who have committed to 100% of new vehicles sold being zero-emission by 2025.¹³⁸ A growing number of countries and cities have announced plans to ban vehicles powered by fossil fuels and automaker Volkswagen has announced that they will stop developing engines fuelled by petrol or diesel after 2026.¹³⁹

A number of cities have made considerable progress towards improving the amount of cycling. Notably, cycling mode share has increased from almost zero to about 15% in Vitoria-Gasteiz, Spain, in less than a decade.¹⁴⁰ The city's transport policy has strongly promoted cycling through the expansion of the cycle lane network, improved cycle parking facilities, and the introduction of safety courses and new cycling regulations, in addition to enhanced communication on the health benefits of cycling.¹⁴¹ The search for a more comprehensive metric of active transport remains elusive, principally limited by scarcity of data access in this field.

Indicator 3.5: emissions from livestock and crop production

Headline finding: total emissions from livestock have increased by 14% and emissions from crop production have increased by 10%, from 2000 to 2016, with 93% of livestock emissions attributed to ruminants

Obesity and undernutrition present two great challenges to global public health, and both these forms of malnutrition share many common systemic drivers with climate change.¹⁴² Current dietary trends are contributing to both non-communicable diseases and greenhouse-gas emissions, with further planetary impacts including biodiversity loss and changes in water and land use.¹⁰¹

In particular, excess red meat consumption contributes to the risk of cardiovascular disease and type 2 diabetes as well as increased greenhouse-gas emissions.¹⁴³ Although total emissions from crops and livestock will need to substantially decline in the future, particular attention should be given to capitalising on low-carbon production processes, and reducing the consumption of ruminant meat and other animal source foods, particularly in high-income settings.^{20,37} Importantly, the nuance and complexity of any such indicator must be emphasised, and no one-diet-fits-all solution exists.¹⁰¹

For the 2019 *Lancet* Countdown report, this indicator focuses on emissions from livestock and crop production. The new analysis added here provides a novel method of understanding the emissions profile of agricultural groups—for example, ruminant livestock. A full description of the methods and data is provided (appendix pp 81–84).

Overall emissions from livestock have increased by 14% since 2000 to over 3.2 GtCO₂e in 2016 (figure 18). Ruminants contribute 93% of total livestock emissions

(3 GtCO₂e per year), with 62–65% of this value attributed to non-dairy cattle (used for meat; appendix pp 81–84). However, the largest increase in emissions from 2000 to 2016 has come from poultry, with a recorded increase in emissions of 58% (an increase from 30·6 million tonnes CO₂e in 2000 to 48·5 million in 2016), more than double the increase from non-dairy cattle.

Total emissions from crop production have increased by 10% since 2000, to around 2 GtCO₂e in 2016. Paddy rice cultivation, which releases methane, contributes around half of these emissions (47–50%), with cultivation of organic soils (such as peatlands) contributing 27–29%, and addition of nitrogen fertilisers (synthetic and manure) to soils contributing 21–25%.

Indicator 3.6: mitigation in the health-care sector

Headline finding: greenhouse-gas emissions from the global health-care sector were approximately 4·6% of the global total emissions

Section 2 emphasises the central role of the health-care sector in managing the damages to health resulting from a changing climate; however, this sector is also a large contributor of greenhouse-gas emissions, both directly and indirectly through purchased goods and services. National-level studies for the USA,¹⁴⁴ Canada,¹⁴⁵ and Australia,¹⁴⁶ have used environmentally-extended input-output (EEIO) modelling to show that health-care sector emissions contribute between 4% and 10% of total greenhouse-gas emissions in these countries. EEIO models have been widely used since the 1970s,¹⁴⁷ and underpin consumption-based accounting of emissions done at national and global scales.¹⁴⁸ An important advantage of using EEIO modelling is that health-care sector emissions are estimated on a life cycle basis, meaning that all emissions are accounted for, from the electricity use of health-care facilities, to the energy to produce and transport medical equipment and pharmaceuticals.

National-level studies cannot easily be compared because of differences in how emission inventories, monetary input-output tables, and health expenditure data are collected in each country. Additionally, a proportion of health-care sector emissions in each country is imported from other countries as embodied carbon in traded commodities, thus requiring a global scope and the use of multi-region input-output (MRIO) models that cover more than one country. For this edition of *The Lancet Countdown*, a standardised, international measure of health-care sector greenhouse-gas emissions was created using multiple MRIO models (EXIOBASE, WIOD; figure 19) that cover 40–47 countries and rest-of-world regions, in combination with WHO health expenditure data for 187 countries, assigned to the MRIO model geographic units.

Variations in per-capita greenhouse-gas emissions associated with health care as a function of time, affluence, and the proportion of national economic output spent on health care are shown (figure 19). Per capita, US emissions

Figure 19: Variations in per capita health-care sector emissions as a function of time, per capita GDP, and the proportion of national spending on health care

(A) Health-care sector emissions as a function of GDP per capita (bubble widths indicate the proportion of national spending on health care). (B) Health-care sector emissions as a function of time. Graphs created using multiregional input-output EXIOBASE model. CO₂e=carbon dioxide equivalent. GDP=gross domestic product. AU=Australia. BR=Brazil. CA=Canada. CN=China. DE=Germany. GR=Greece. IN=India. JP=Japan. KR=South Korea. MX=Mexico. RU=Russia. SE=Sweden. TR=Turkey. ZA=South Africa.

are substantially higher than those of any other country and have risen steadily over the study period 2007–16, with a 19% increase. However, per-capita health-care emissions of other countries have increased even more substantially, albeit from a lower base, including China (CN, 180% increase), South Korea (KR, 75%) and Japan

Panel 3: Response of the health-care sector to climate change

Health systems are increasingly faced with the dual challenges of responding to the health impacts of climate change and reducing the contribution of the health-care sector to greenhouse-gas emissions. From 2013 to 2018, participants from health systems, health centres, and hospitals, from 19 different countries, and representing 9199 health centres and 1693 hospitals, have participated in the Health Care Climate Challenge. The Challenge addresses key areas including local climate change risk assessments, health adaptation plans, fossil fuel and renewable energy project investments, and works with government agencies to support greenhouse-gas emission reductions and health-care sector adaptation.

A leader in climate action progress is Kaiser Permanente (KP), one of the largest not-for-profit health systems in the USA, serving 12·3 million members. Between 2008 and 2017, KP reduced its operational greenhouse-gas emissions by 29%, and increased its membership by 36%. As of early 2018, 36 KP facilities hosted onsite solar panels. KP is working to increase its purchasing of renewable electricity to 100% of total usage by 2020. Anaesthetic gases account for 3% of KP's greenhouse-gas emissions. Between 2014 and 2018, KP achieved a 24% reduction in greenhouse-gas emissions associated with its use of anaesthetic gases through progressive elimination of the drug Desflurane.¹⁵⁰

The largest example of a health system taking steps to reduce greenhouse-gas emissions and other environmental effects comes in the form of the UK National Health Service (NHS). A national-level detailed analysis of government funded health care shows that the NHS public health and social sector in England reduced its greenhouse-gas emissions (excluding chlorofluorocarbons) by 18·5% from 2007 to 2017, while clinical activity increased by 27·5% over the same time period.¹⁵¹ Efforts are also being made to reduce water use, plastic waste, and air pollution from the NHS.

(JP, 37%). By contrast, health-care greenhouse-gas emissions in Greece showed a marked decrease (GR, -35%), probably reflecting the economic hardships. Results using the WIOD MRIO model show similar trends but slightly lower absolute greenhouse-gas emissions. The lowest per capita emissions modelled were for India (IN) and Indonesia (ID), which were less than 2·5% of values recorded for the USA. Comparison of emissions per capita and Gross Domestic Product (GDP) per capita show a levelling off trend for health-care emissions versus affluence, except for in the USA.

Overall, health care was responsible for approximately 2250 metric tonnes of CO₂e in 2016, or 4·6% of the global total emissions (excluding land use change). A parallel global analysis using a different MRIO model (EORA) measuring CO₂ only (excluding other greenhouse gases) for 36 countries determined a health-care contribution of 4·4% to the global total for the countries considered,¹⁴⁹ corroborating the results presented here. Although global health-sector greenhouse-gas emissions are rising, efforts to reduce these have begun (panel 3).

Conclusion

The indicators of section 3 present a mix of encouraging and concerning trends. Renewable electricity generation continues to grow, as does access to energy, and electric vehicle sales. However, the carbon intensity of the energy system remains unchanged, with coal supply increasing, reversing the 2014–16 downward trend, and a substantial

effort is required to decarbonise the agricultural sector and the health-care sector. In summary, greenhouse-gas emissions continue to rise. Notably, the year 2020 is important for two reasons—it is the year that the implementation period of the Paris Agreement begins, and the year during which most studies suggest global emissions must peak to remain on the path to achieving the 1·5°C goal. To meet both commitments, a substantially stronger global response is urgently required, to reduce greenhouse-gas emissions and minimise the future health risks of climate change. The health sector has an important role to play in achieving these goals, both by reducing its own emissions and working with policy makers to help design and implement measures that reduce greenhouse-gas emissions and maximise health co-benefits.

Section 4: economics and finance

Section 4 examines the financial and economic dimensions of the effects of climate change, and of mitigation efforts required to respond to these changes. Although many indicators in this section could appear to be distant from human health, they are key to tracking the low-carbon transition that underpins current and future determinants of human health and wellbeing described in sections 1–3.

The projected economic cost of inaction to tackle climate change is enormous. For example, compared with maintaining a 2°C limit, the costs of 3°C of warming are expected to reach US\$4 trillion per year by 2100 (around 5% of total global GDP in 2018), and the total economic costs of a 4°C rise are estimated at US\$17·5 trillion (over 20% of GDP in 2018).¹⁵²

Investment to mitigate climate change substantially reduces these risks and generates further economic benefits. For example, the UK's independent Committee on Climate Change calculated that achieving net-zero emissions in the UK in 2050, in line with the more ambitious objective of the Paris Agreement, is likely to require investments of 1–2% of the UK's GDP in 2050. However, if the economic value of co-benefits to human health (and savings to the NHS—for example, from reduced air pollution), and the creation of low-carbon industrial opportunities are considered, the economic implications are likely to be positive.¹⁵³ Global economic benefits are likely to be maximised (and costs minimised) if strong policy action is taken as soon as possible to accelerate the low-carbon transition.

The nine indicators in this section fall into four broad themes: economic costs of climate change (indicator 4.1); economic benefits of tackling climate change and air pollution (indicator 4.2); investing in a low-carbon economy (indicators 4.3.1, 4.3.2, 4.3.3, and 4.3.4); and pricing greenhouse-gas emissions from fossil fuels (indicators 4.4.1, 4.4.2, and 4.4.3).

The 2019 report adds an additional indicator tracking the economic value of change in mortality associated with air pollution (indicator 4.2).

Figure 20: Economic losses from climate-related events relative to GDP
GDP=gross domestic product. US\$2018=based on the value of the US dollar in 2018.

Indicator 4.1: economic losses associated with climate-related extreme events

Headline finding: in 2018, a total of 831 climate-related extreme events resulted in overall global economic losses of US\$166 billion. Although most losses were in high-income countries and insured, no measurable losses from events in low-income countries were covered by insurance

The indicators in section 1 presented changes in exposures and resulting effects on health of climate-related extreme events (indicators 1.2.1, 1.2.2, and 1.2.3). The economic costs of extreme climate-related events might exacerbate the direct health impacts that these events produce. This indicator tracks the total annual economic losses (insured and uninsured) across country income groups relative to GDP, resulting from climate-related extreme events.

The data for this indicator is sourced from Munich Re's NatCatSERVICE,¹⁵⁴ with climate-related events categorised as meteorological, climatological, and hydrological events (geophysical events are excluded) as well as data from the World Bank Development Indicator Database.¹⁵⁵ The methodology remains the same as was used in the 2018 *Lancet* Countdown report.³⁷ Full methodology, along with data for 1990–2018 are presented (appendix p 87–90).

Insured and uninsured economic losses resulting from extreme climate-related events, relative to GDP, are shown (figure 20). Absolute global economic losses in 2018 were

US\$166 billion, around half the value experienced in 2017, but still higher than any other year since 2005. Economic losses are highest in high-income countries, but more than half of these losses in high-income countries were insured. By contrast, although in previous years less than 1% of losses in low-income countries were insured (for example, US\$20 million of \$1.9 billion losses in 2017), in 2018, not a single event recorded created measurable losses covered by insurance.

Indicator 4.2: economic costs of air pollution

Headline finding: across Europe, improvements in particulate air pollution from human activity were seen from 2015 to 2016.

If the change in pollution over these 2 years remained the same over the course of a person's life, this difference would lead to an annual average reduction in YLL worth €5.2 billion

Indicator 4.2 is a new indicator for the 2019 report and is the first indicator tracking the economics of the health co-benefits of climate change mitigation, capturing the economic costs of the effect of air pollution on human health (indicator 3.3.2). It will be developed into a full suite of metrics over the coming years, with 2019 presenting values for the EU alone.

This indicator is based on estimates of the total YLL to the 2015 population of EU Member States that results from the change in anthropogenic PM_{2.5} exposure from

Figure 21: Annual investment in coal-fired capacity from 2006 to 2018

2015 to 2016, if such emissions and subsequent population exposure were to remain constant over the course of their remaining lifetimes. Each YLL is assigned a Value of a Life Year of €50 000, which is the lower bound estimate as suggested by the EU Impact Assessment Guidelines.¹⁵⁶ Further details regarding this indicator are discussed (appendix pp 90–93).

As described under indicator 3.3.2, anthropogenic $PM_{2.5}$ pollution decreased between 2015 and 2016 in Europe, largely because of a reduction in emissions from the power sector. If the population of the EU in 2015 were exposed to anthropogenic $PM_{2.5}$ emissions at the concentrations recorded in 2016 (rather than the concentration recorded in 2015) consistently to the year 2115, the total annual average economic value of the reduction in YLLs would be about €5.2 billion. However, even at the concentrations of anthropogenic $PM_{2.5}$ pollution recorded in 2016, the total annual average cost to the population of 2015 would still be €129 billion, with the greatest costs generally found in countries with the largest populations. The greatest projected average life lost per person due to high ambient $PM_{2.5}$ concentrations is seen in Hungary, Romania, and Poland (at more than 8 months per person), with an EU average of 5.7 months of life lost per person.

For the first iteration of this indicator, calculation of annual YLLs attributable to $PM_{2.5}$ exposure in a given year was not possible. However, methodological refinements should allow this metric to be reported in the 2020 report.

Indicator 4.3: investing in a low-carbon economy

Indicator 4.3.1: investment in new coal capacity—headline finding: global investment in new coal-fired electricity capacity declined again in 2018, continuing the downward trend observed since 2011

Indicator 3.1.2 tracks progress on coal phase-out through the total primary energy supply of coal, while this indicator

discusses the future of coal-fired power generation through tracking investments in coal-fired capacity.

The data source for this indicator (IEA) remains the same as in the 2017 *Lancet Countdown* report;²⁰ however, the methodology has altered and has been retrospectively applied to reanalyse all data presented. The revised approach considers ongoing capital spending, with investment in a new plant spread evenly from the year new construction begins, to the year it becomes operational. Previously, data was presented as a so-called overnight investment, in which all capital spending on a new plant is assigned to the year in which the plant became operational (appendix p 93). Data for 2006–17 using the overnight method are presented for comparison with the ongoing capital spending method (figure 21).

Although TPES for coal increased in 2018 (indicator 3.1.2), investment in new coal-fired electricity generating capacity continued the downward trend observed since 2011. Notably, this decline was mostly due to reduced investment in the same countries that increased their coal TPES in 2018 (China and India), providing hope for coal phase-out. The number of total Final Investment Decisions (ie, the decision to begin construction) declined by 30% in 2018, with costs and construction times for new plants generally increasing because of larger, more efficient, and complex designs, and the use of advanced pollution control systems, in response to concerns regarding air quality.¹⁵⁷

Indicator 4.3.2: investments in low-carbon energy and energy efficiency—headline finding: trends in energy investments are currently heading in the wrong direction. In 2018, investments in fossil fuels increased, whereas investments in low-carbon energy decreased

Indicator 4.3 monitors global investment in low-carbon energy, energy efficiency, fossil fuels, and electricity networks. It complements the tracking of low-carbon electricity generation (indicator 3.1.3) in section 3 and potentially predicts future trends in this indicator. All values reported are based on the value of the US dollar in 2018 with data sourced from the IEA.¹⁵⁷ The data sources for this indicator remain the same as described in the 2017 *Lancet Countdown* report;²⁰ however, the methodology has been updated (appendix pp 94–95).

Total investment in the global energy system remained stable at around US\$1.85 trillion in 2018, following a steady decline between 2015 and 2017 (figure 22). Investment in fossil fuels increased slightly, driven by an increasing oil price, and investment in low-carbon energy slightly decreased, driven by reduced investment in renewable electricity—partly the result of continually declining costs. Investments in energy efficiency and electricity networks remained stable between 2017 and 2018.

In contrast to the growth in low-carbon electricity generation (indicator 3.1.3), these investment trends are not consistent with limiting warming to “well below 2°C”. The IEA estimate that in order to achieve a pathway consistent with the goals of the Paris Agreement,

investment in low-carbon energy, electricity networks that enable it, and energy efficiency, must collectively increase 2.5-fold by 2030 (even with further expected reductions in the cost of such technologies and actions), and account for at least 65% of total annual investment in the global energy system.^{157,158}

Indicator 4.3.3: employment in renewable and fossil fuel energy industries—headline finding: in 2018, renewable energy provided 11 million jobs—an increase of 4.2% from in 2017. Employment in fossil fuel extraction industries also increased to 12.9 million—a 2% increase from in 2017

Occupational health consequences of working in certain key fossil fuel industries, such as risk of injury and respiratory disease, and risk of damage to hearing and skin, are well documented.²⁰ However, with appropriate planning and policy, the transition of employment opportunities from high-carbon to low-carbon industries could yield positive consequences for both the economy and human health.¹⁵⁹

This indicator tracks global direct employment in fossil fuel extraction industries (coal mining and oil and gas exploration and production) and direct and indirect (supply chain) employment in renewable energy (figure 23). The data for this indicator are sourced from the International Renewable Energy Agency (IRENA) (renewables) and IBISWorld (fossil fuel extraction).^{160–162} The data for fossil fuel extraction employment for 2012–2017 differs substantially from that presented in the 2018 Countdown report, because of improved data collection and estimation methods for global coal mining employment by IBISWorld. Similarly, values for hydropower and other technologies for renewable energy employment have been revised, following methodological changes (appendix pp 95–96).

In 2018, around 11 million people were employed either directly or indirectly in the global renewable energy industry. This value represents a 4.2% increase from 2016, with growth in five of the six renewable energy categories. Employment in the solar photovoltaic industry increased by more than 7%, and remains the largest employer, with China responsible for nearly two-thirds of jobs in this industry. Overall, 32% of global renewable energy jobs are held by women.¹⁶²

Growth in employment in the fossil fuel extractive industries has been driven by both the growth of coal mining in China and other emerging markets (particularly India), despite a decline in many high-income countries, and the upstream oil and gas industries, following rising prices in 2018. However, employment in both industries is expected to decrease in the coming years because of the slowing growth in demand for coal in key markets such as China, and a decline in other (particularly high-income) markets, as the transition to low-carbon electricity continues, along with a potential decline in oil and gas prices—coupled with increasing productivity.^{160,161}

Figure 22: Annual investment in the global energy system

US\$ 2018=based on the value of the US dollar in 2018.

Figure 23: Employment in renewable energy and fossil-fuel extraction sectors

Data from IBISWorld^{160,161} and IRENA.¹⁶²

Indicator 4.3.4: funds divested from fossil fuels—headline finding: the global value of new funds committed to fossil fuel divestment in 2018 was US\$2.135 trillion, of which health institutions accounted for around US\$66.5 million; this represents a cumulative sum of US\$7.94 trillion since 2008, with health institutions accounting for US\$42 billion. Originating in the late 2000s, the divestment movement aims to remove the so-called social licence to operate from the fossil fuel industry and guard against the risk of losses from stranded assets, by encouraging investors to commit to divest themselves of assets related to the industry. The debate on the direct and indirect consequences of these approaches is nuanced and complex, with evidence regarding their effects only beginning to emerge.¹⁶³

This indicator tracks the total global value of funds divested from fossil fuels and the value of divested funds from health institutions, by use of data provided by 350.org.¹⁶⁴

For more on funds divested from fossil fuels see <https://gofossilfree.org>

Figure 24: Global fossil-fuel and electricity consumption subsidies in 2008–18
US\$ 2018=based on the value of the US dollar in 2018.

	2016	2017	2018	2019
Global emissions coverage*	12.1%	13.1%	13.1%	13.1%
Weighted average carbon price of instruments (prices in US\$)	7.79	9.28	11.58	13.08
Global weighted average carbon price (prices in US\$)	0.94	1.22	1.51	1.76

*Global emissions coverage is based on 2012 total anthropogenic greenhouse-gas emissions.

Table 1: Carbon pricing—global coverage and weighted average prices per tonnes of carbon dioxide equivalent

From 2008 to the end of 2018, 1026 organisations with cumulative assets worth at least US\$7.94 trillion, including 23 health organisations with assets of around US\$42 billion, had committed to divestment, including the World Medical Association, the British Medical Association, the Canadian Medical Association, the UK Royal College of General Practitioners, and the Royal Australasian College of Physicians. The annual value of new funds committing to divesting increased from US\$428 billion in 2017 to \$2.135 trillion in 2018. However, health institutions have divested at a reduced rate, with just US\$866.5 million divested in 2018, compared with \$3.28 billion in 2017.

Indicator 4.4: pricing greenhouse-gas emissions from fossil fuels

Indicator 4.4.1: fossil fuel subsidies—headline finding: in 2018, fossil fuel consumption subsidies increased to US\$427 billion, more than a third higher than 2017 subsidies, and more than 50% higher than 2016 subsidies

Negative externalities, including the various direct and indirect consequences for human health and the natural environment, mean that the true cost of fossil fuels is far greater than their market price.¹⁶⁵ Fossil fuel subsidies

(both for their consumption and their extraction) artificially lower prices even further, promoting overconsumption, further exacerbating both greenhouse-gas emissions and air pollution.

This indicator tracks the value of fossil fuel consumption subsidies in 42 countries, most of which are not members of the Organization for Economic Cooperation and Development. Although these countries account for a large proportion of such subsidies around the world, they are by no means comprehensive, meaning that the values reported are conservative. The methodology and data source (IEA) for this indicator remains unchanged since the 2018 *Lancet* Countdown report³⁷ Data for 2008 and 2017, which was previously not available, is now included (appendix pp 97–102).

Although fossil fuel subsidies declined between 2012 and 2016, this trend was reversed in both 2017 and 2018, reaching US\$319 billion and \$427 billion, respectively (figure 24). These values do not include the economic value of the unpriced negative externalities. If these values were to be included, the IMF estimated that in 2017 global subsidies to fossil fuels increased to US\$5.2 trillion—equivalent to 6.3% of Gross World Product.¹⁶⁶

Indicator 4.4.2: coverage and strength of carbon pricing—headline finding: carbon pricing instruments in early 2019 continue to cover 13.1% of global anthropogenic greenhouse-gas emissions, but average prices were around 13% higher than in 2018

Adequately pricing carbon emissions is an essential component in shifting investment to develop a low-carbon economy. This indicator tracks the extent to which greenhouse-gas emissions are priced, and the weighted-average price these instruments provide (table 1), using data from the World Bank Carbon Pricing Dashboard.¹⁶⁷ The full methodology is presented and remains unchanged from the 2017 *Lancet* Countdown report (appendix pp 102–104).

The coverage of carbon-pricing instruments remained at around 13.1% of global anthropogenic

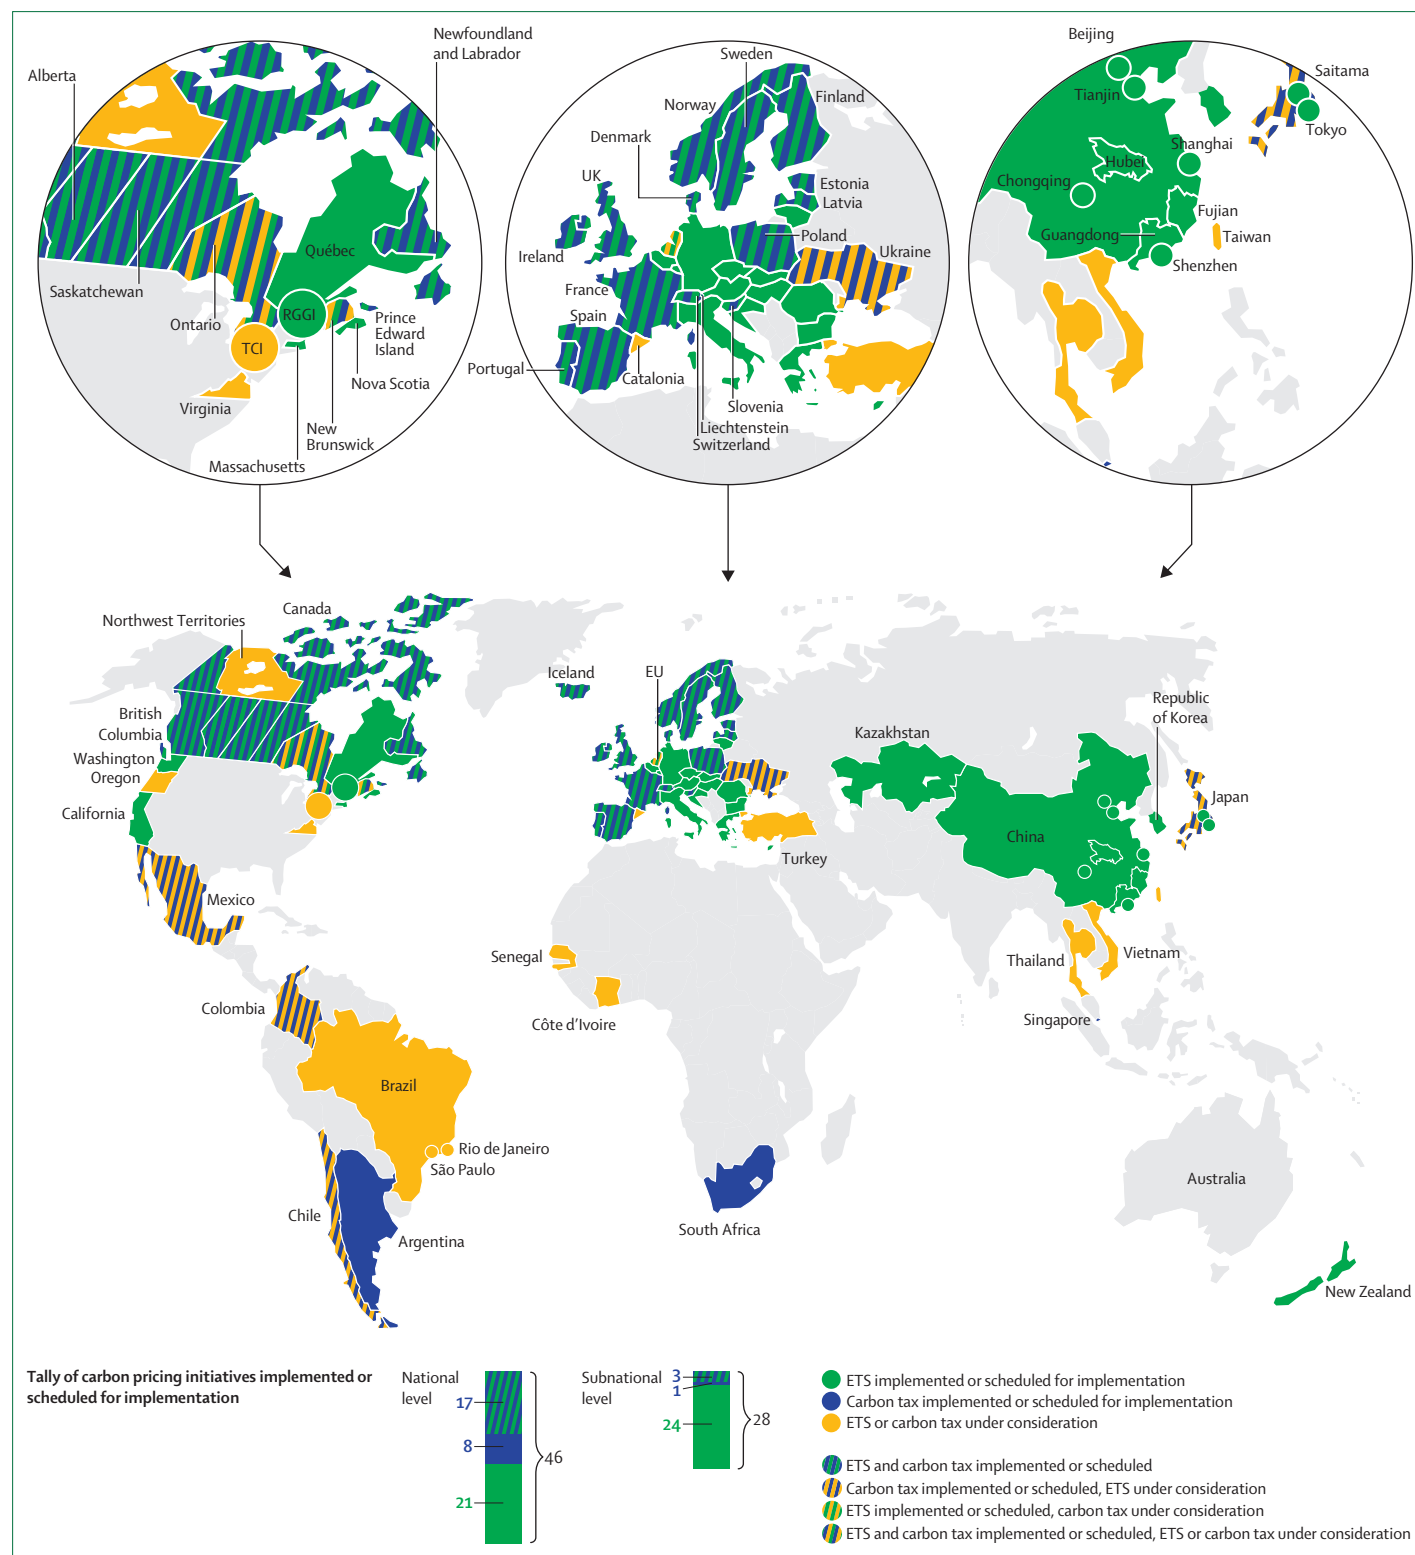

Figure 25: Summary map of regional, national, and subnational carbon pricing initiatives implemented, scheduled for implementation, and under consideration (ETS and carbon tax)

Adapted from State and Trends of Carbon Pricing 2019,¹⁶⁸ by permission of World Bank Group. The large circles represent cooperation initiatives on carbon pricing between subnational jurisdictions. The small circles represent carbon pricing initiatives in cities. Carbon pricing initiatives are considered to be scheduled for implementation when they have been formally adopted through legislation and have an official, planned start date. Carbon pricing initiatives are considered to be under consideration if the government has announced its intention to work towards the implementation of a carbon pricing initiative and this has been formally confirmed by official government sources. The carbon pricing initiatives have been classified in ETSs and carbon taxes according to how they operate technically. ETS not only refers to cap-and-trade systems, but also to baseline-and-credit systems as seen in British Columbia. Australia had a carbon tax implemented in 2012, which was then removed in 2014.

ETS=Emissions Trading Scheme.

greenhouse-gas emissions between 2018 and 2019, implemented through 44 national and 27 sub-national instruments.

Carbon prices across instruments are widely varied, from less than US\$1/tonne CO₂e (tCO₂e) in Poland, Ukraine and the Chongqing and Shenzhen pilot schemes

	Value (US\$)	Proportion of total funds
Mitigation	24·36 billion	56·6%
Adaptation	258 million	0·6%
Revenue recycling	5·50 billion	12·8%
General funds	12·91 billion	30%
Total revenue	43·03 billion	100%

Table 2: Carbon pricing revenues and allocation in 2018

in China, to \$127/tCO₂e in Sweden. Weighted-average prices in early 2019 were 13% higher than 2018 prices, driven in large part by an increasing price under the EU Emissions Trading Scheme (EU ETS; the largest carbon pricing instrument in the world, responsible for nearly half of the economic value of all instruments combined). However, the weighted average of these carbon pricing instruments remains insufficient to remain “well below 2°C”, which would require a carbon price of US\$40–80/tCO₂e by 2020,¹⁶⁸ and the revenue generated through carbon pricing (described in indicator 4.4.3) is far less than the potential annual impacts of unmitigated climate change on global GDP.¹⁵²

Further carbon pricing instruments are under consideration (figure 25). With the addition of these instruments—and in particular the Chinese national Emissions Trading Scheme (ETS; replacing the existing subnational so-called pilots), more than 20% of global anthropogenic greenhouse-gas emissions will be covered by carbon price.¹⁶⁹

Indicator 4.4.3: use of carbon pricing revenues—headline finding: revenues from carbon pricing instruments increased by US\$10 billion between 2017 and 2018, reaching \$43 billion, with \$24·4 billion allocated to further climate change mitigation activities

As the previous indicator outlined, adequately pricing carbon is essential for mitigating greenhouse-gas emissions. How the revenue generated by these pricing instruments is used will also have important consequences. Four ways the revenue could be used include: investment in further mitigation; investment in adaptation; recycling for other purposes (such as enabling the reduction of other taxes or levies); and contributing to other general government funds. This indicator tracks the total government revenue from carbon pricing instruments and the area in which it will be allocated.

Data on revenue generated is provided on the WBG Carbon Pricing Dashboard,¹⁶⁷ with revenue allocation information obtained from various sources. Only instruments with revenue estimates and with revenue received by the administering authority before redistribution are considered. Further information regarding the methodology and various sources used to obtain information on revenue allocation are presented (appendix pp 104–106).

Government revenue generated from carbon pricing instruments in 2018 totalled over US\$43 billion;

a \$10 billion increase from the \$33 billion generated in 2017. This change was driven by increasing prices of allowances sold at auction in the EU ETS; higher tax rates for instruments in Alberta, British Columbia, and France; and allowance sales in California and Quebec.¹⁶⁹

The revenue allocated to mitigation activities increased by about US\$10 billion between 2017 and 2018, and revenue allocated to revenue recycling and general funds also increased (table 2). Revenue allocated to adaptation reduced substantially, from more than US\$1·5 billion to around \$250 million.

Conclusion

Section 4 has presented indicators on the economic impacts of climate change, the financial and economic underpinnings of climate change mitigation, and the economic value of the associated health benefits. The results of these indicators suggest that the shift to a low carbon global economy is slowing in various sectors, and previously promising trends emphasised in the 2018 report have been reversed. Given the need to transition the global economy to net-zero greenhouse-gas emissions by 2050 to limit warming to well below 2°C, governments at all levels—in collaboration with the private sector and the population—must take immediate steps towards implementing strong, ambitious policies and related actions to steer and rapidly accelerate their economies towards a low-carbon state. The health sector and health professionals can contribute through the removal of institutional investment in fossil fuels, assessments of the health economics of mitigation co-benefits, and by communicating the negative externalities associated with the continued use of fossil fuels.

Section 5: public and political engagement

As the previous sections have emphasised, climate change is human in both origins and effects. Its origins lie in the burning of fossil fuels, particularly during early industrial periods, and its effects include an increasing toll on human health. Reductions in global greenhouse-gas emissions at the speed required by the Paris Agreement depend on engagement by all sectors of society.

In the 2019 *Lancet* Countdown report, section 5 focuses on engagement in four domains: the media, government, corporate sector and, for the first time, individual engagement. It tracks trends in engagement across the last decade, complementing this evidence with analyses of the content and dynamics of engagement in 2018. The methods for an indicator relating to a fifth domain, scientific engagement, are being refined to ensure the long-term sustainability of this work, and will be reported again in 2020. In every case, indicators in this section build on methods used in earlier *Lancet* Countdown reports, which continue to be refined and extended.

The media is central to public understanding of climate change; it provides a key resource through which people make sense of climate change and assess the actions of

governments to address it.^{170–173} The media indicator (5.1) includes an analysis of global coverage of health and climate change in 62 newspapers from 2007 to 2018. For the 2019 *Lancet* Countdown report, this has expanded to include coverage of health and climate change in China's *People's Daily* (in its Chinese-language edition, *Renmin Ribao*). As the official outlet of the Chinese party-state, the *People's Daily* is China's most influential newspaper.¹⁷⁴ The indicator has been further enhanced by a content analysis of the elite press in two contrasting societies, India and the USA. Elite newspapers both reflect and shape engagement in climate change by governments and elite groups.^{175–179}

The internet is an increasingly important medium of civic engagement and has transformed individual access to global knowledge and debates. The second indicator tracks engagement in health and climate change through individuals' information-seeking behaviour on the online encyclopaedia, Wikipedia.¹⁸⁰ Because of its accessibility, breadth, and user trust, Wikipedia is one of the most widely used online resources.^{181–185}

Recognising that climate change is harming people, the global public support government action to decrease greenhouse-gas emissions.^{186–188} The third indicator relates to government engagement in health and climate change and focuses on high-level government engagement in health and climate change at the UN General Assembly. It tracks references at the UN General Debate, the major international forum during which national leaders have the opportunity to address the global community on issues they consider important.^{189,190}

The fourth indicator relates to the corporate sector, recognised to be central to a rapid transition to a carbon-free economy, both through its business practices and wider political and public influence.^{191–193} Focusing on the health sector, the indicator tracks engagement in health and climate change through analyses of the annual reports submitted by companies signed up to the UN Global Compact—the world's largest corporate sustainability initiative.¹⁹⁴

Indicator 5.1: media coverage of health and climate change

Headline finding: media coverage of health and climate change continued to increase between 2007 and 2018 with the elite press emphasising the health impacts of climate change and the co-benefits of climate change action

This indicator tracks coverage of health and climate change in the global media, including in the Chinese *People's Daily*. Additionally, it provides insight into which aspects of the health–climate change nexus are receiving attention in the elite media in India and the USA. For the 2019 *Lancet* Countdown report, methods to track newspaper coverage have been improved and greater attention is also given to the content of coverage.

Global media coverage of health and climate change has increased since 2010. Alongside broader coverage of

Figure 26: Coverage of climate change and health and climate change in *People's Daily* between 2008 and 2018

climate change, spikes in media engagement with health and climate change coincided with major events in climate governance.¹⁹⁵ These include the 2009 and 2015 UNFCCC Conferences of Parties (COPs) in Copenhagen and Paris and, in 2016, the Paris Agreement and the Sustainable Development Goals coming into force. However, health continued to represent only a small proportion of the wider coverage of climate change. Analysis details, together with data sources and methodological enhancements are described (appendix pp 107–127). The indicator is based on 62 newspapers (English, German, Portuguese, Spanish) selected to provide a global spread of higher-circulation papers.

Additionally, coverage of health and climate change in the *People's Daily* was tracked to extend the analysis (figure 26). Although the Chinese media has changed and diversified in recent decades, the *People's Daily* retains its dominance.^{174,196,197} Across the 2008–18 period, an average of 2519 articles per year were published discussing climate change. A small proportion of these related to human health, with a mean of 14 articles per year. Spikes in coverage are less closely tied to important events in global climate change governance (such as the signing of the Paris Agreement in 2015) than in the global media. An explanation for this difference in reporting might be the timing of *People's Daily* coverage of global events, including the COPs, which occurs after their conclusion; coverage of November and December COPs might occur in the following calendar year.

This addition to indicator 5.1 was based on the *People's Daily* online archive,¹⁹⁸ and combined electronic searching of the text corpus (keyword searches and algorithm-based natural language processing) with manual screening of the filtered articles (appendix pp 110–117).

The analysis of the content of coverage focused on the high-circulation elite press in India and the USA: *Times of India*, *Hindustan Times*, *New York Times*, and

Washington Post. Two time-periods were selected to cover months July–September, during which both countries experienced extreme weather events (monsoon flooding and wildfires, respectively) together with months November–December covering the 2018 COP in Katowice. Articles in international news databases Nexis and Factiva were keyword searched and manually screened for inclusion. Template analysis was used to identify themes; a priori coding derived from *Lancet* Countdown indicators and inductive coding from recurrent topics in the data were employed.¹⁹⁹ Additional analyses and full details of methods are provided (appendix pp 117–127).

Coverage of health and climate change clustered around three broad connections between the two areas (panel 4). The first theme is associated with the health impacts of climate change. These impacts related to climate change-related stressors (eg, increased

temperatures, wildfires, precipitation extremes, food security, population displacement) and health sequelae (eg, vector-borne disease, heat stress, mental health disorders) and were discussed in 62% of the articles. The health effects resulting from heat were the most commonly-mentioned impact. The second theme focused on the common determinants of health and climate change, particularly air pollution, and the co-benefits to be derived from mitigation strategies to address them (eg, investment in clean energy, active travel, and plant-based diets) and was discussed in 44% of articles. The third theme is related to adaptation. Evident in 13% of the articles, it included both emergency response and longer-term planning. The three themes were represented in similar proportions in *Hindustan Times*, *New York Times*, and *Washington Post*, but *Times of India* gave greater emphasis to common causes and co-benefits than did the other newspapers.

Panel 4: Dominant themes in elite newspaper coverage of health and climate change in India and the USA in 2018

Health impacts of climate change

"Climate change [is] making mosquitoes bolder and the germs they transmit stronger, leading to a spurt in mosquito-borne diseases, particularly chikungunya." (*Times of India*, August 9)

"As large wildfires become more common—spurred by dryness linked to climate change—health risks will almost surely rise...a person's short-term exposure to wildfire can spur a lifetime of asthma, allergy and constricted breathing." (*New York Times*, November 17)

Benefits of addressing climate change and health together

"To protect our future, new infrastructure must be low-carbon, sustainable and resilient...in 2030, this kind of climate action could also prevent over 700 000 premature deaths from air pollution annually...if cities are built in more compact, connected and coordinated ways, they can improve residents' access to jobs, services and amenities while increasing carbon efficiency." (*Hindustan Times*, December 5)

"For a short time on Thursday night, a small but fiercely determined group of marchers took over a busy DC street to demand better safety for pedestrians and bicyclists...the district has reported 31 traffic deaths so far this year, up from 29 in all 2017...yet lives could be spared...even if it means taking the space from curbside parking. Gove said. "This is a public health crisis. This is a climate change crisis."" (*Washington Post*, November 16)

Adaptation

"Ahmedabad Municipal Corporation (AMC) has adopted a heat action plan which necessitates measures such as building heat shelters, ensuring availability of water and removing neonatal ICU from the top floor of hospitals...it has helped bring down the impact of heatwave on vulnerable populations." (*Times of India*, November 29)

"We rarely do much to protect our cities until disaster strikes... (the) effects of climate change, including the ways it boosts droughts, floods and wildfires, would put more pressure on cities to adapt, mitigate the effects of climate change and become resilient... preparing for disasters and recovering from weather challenges require many different strategies, including holding that rainwater, keeping the flow from going into the drains faster, raising your homes above the flood line." (*New York Times*, December 13)

Indicator 5.2: individual engagement in health and climate change

Headline finding: individuals typically seek information about either health or climate change; when individuals seek information across these areas, it is primarily driven by an initial interest in health-related content

The internet is an increasingly important domain of public engagement, particularly for information-seeking on issues that engage people's attention.²⁰⁰ This indicator tracks individual-level engagement in health and climate change in 2018 through an analysis of use of Wikipedia, the world's largest encyclopaedia. With reviews noting its accuracy,^{181,201} Wikipedia is one of the most-visited websites worldwide,¹⁸² with a high correlation between user visits to Wikipedia and search activity on Google.²⁰² The analysis is based on the English Wikipedia, which represents around 50% of global traffic to all Wikipedia language editions.

This is a new indicator for the 2019 *Lancet* Countdown report and its analysis uses the online footprint of Wikipedia users to map the dynamics of public information-seeking in health and climate change.^{180,203} It analyses clickstream activity, reported on a monthly basis, that captures visits to pairs of articles, for example an individual clicking from a page on human health to one on climate change.²⁰⁴

Articles were identified via keywords and relevant hyperlinks within articles, refined using Wikipedia categories, and then filtered by the initial keywords. Data and methods are described along with further analysis (appendix pp 127–137).

Articles on health and on climate change are internally networked, with extensive co-visiting within these clusters (figure 27). However, the co-clicks suggest little connectivity between the clusters. Health and climate change are seldom topics that an individual connects when they visit Wikipedia; initial engagement in one topic rarely triggers engagement in the other. The

proportion of co-clicks from a health article to a climate change article represented only 0.18% of total health article co-clicks to articles discussing any topics, and only 1.12% of climate change article co-clicks were to a health article. This data also reflects the greater interest of the individual in health articles compared with climate change articles, with the majority (79%) of co-visits originating from a health-related webpage.

Indicator 5.3: government engagement in health and climate change

Headline finding: national leaders are increasingly drawing attention to health and climate change at the UN General Debate in a trend led by small island developing states, which make up 10 of 28 countries referencing the climate change–health link at the UN General Debate in 2018

This indicator tracks high-level political engagement with climate change and health through references to this topic in annual statements made by national leaders in the UN General Debate (UNGD). The UNGD takes place at the start of the annual UN General Assembly and provides a global platform for all UN member states to speak about their priorities and concerns.

An updated dataset, the UN General Debate corpus, was used for the analysis, based on 8093 statements made between 1970 and 2018.^{205,206} Keyword searches used sets of terms associated with health and with climate change, and engagement in the health–climate change nexus was determined by the proximity of relevant keywords within the statement. Methods and data, as well as further analyses are presented (appendix pp 138–151).

The proportion of countries that refer to the links between health and climate change in their UNGD statements, together with the proportion referring separately to climate change or to health, or both, are presented (figure 28). In 2018, 28 countries referenced the climate change and health link at the UNGD.

The data points to an upward trend in government engagement in health and climate change since 1970; a trend that is consistent with broader trends for engagement in climate change. This increase is particularly noticeable since 2004, peaking in 2014, when more than 20% of national leaders spoke of the links between climate change and health. This spike coincided with the transition from the Millennium Development Goals to the SDGs and preparations for the COP 21 in Paris. Since 2014, conjoint references to health and climate change have remained broadly stable; in 2018, 13% of countries made such references. However, increased engagement in health and climate change as separate issues has been noted (figure 28). Around 75% of all countries referred to climate change and 50% to health issues in their 2018 UNGD statements.

The upward trend in engagement in health and climate change is led by the small island developing states,

Figure 27: Connectivity graph of Wikipedia articles on health (blue) and climate change (red) visited in 2018

Popularity of articles is indicated by node size; lines represent co-visits in clickstream data.

Figure 28: Proportion of countries referring to climate change, health, or the linkage between health and climate change in UN General debates between 1970 and 2018

for example, Fiji, Palau, Samoa, Dominica, and St Kitts and Nevis, with ten of these developing states referring to the climate change–health link in 2018. In these speeches, connections between climate change and health are explicitly made and linked to wider inequalities between and within countries. For example, the 2018 address by St Kitts and Nevis notes that “NCDs [non-communicable diseases] and climate change are two sides of the same coin” and Dominica’s statement makes clear that “climate change arises from activities that support and reflect inequalities...it is the poor whose

lands are impacted by severe droughts and flooding and whose homes are destroyed and whose loved ones perish. It is the poor who have the least capacity to escape the heavy burdens of poverty, disease and death.” The social justice theme is echoed in other speeches; for example, the Malawi address notes that “the hostile consequences of climate change, food insecurity and malnutrition are serious threats in a country that still relies on rain-fed subsistence agriculture.”

Indicator 5.4: corporate sector engagement in health and climate change

Headline finding: engagement in health and climate change remains low among companies within the UN Global Compact, including companies in the health-care sector

This indicator tracks corporate sector engagement through references to health and climate change in companies that are part of the UN Global Compact (UNGC), a UN-supported platform to encourage companies to put a set of principles—including environmental responsibility and human rights—at the heart of their corporate practices.²⁰⁷ Although the UNGC has been the topic of criticism, it remains the world’s largest corporate citizenship initiative.^{208–210}

Companies submit annual Communication of Progress reports with respect to their progress in advancing UNGC principles. Over 12 000 companies have signed up to the UN Global Compact from more than 160 countries.¹⁹⁴

Analysis was based on keyword searches of sets of health-related and of climate change-related terms in Communication of Progress reports in the UNGC database;¹⁹⁴ conjoint engagement in health and climate change was identified by the proximity of relevant key words within the Communication of Progress report. Methods, data, and additional analyses are presented (appendix pp 151–164). The analysis focuses on the period from 2011 to 2018 because very few reports are available with data from before 2011.

A small proportion of companies referred to the links between health and climate change before 2017.³⁷ This pattern continues in the 2018 Communication of Progress reports. Although about 45% of the 2018 reports refer to climate change, and 60% refer to health, only 15% refer to a linkage between the two topics (appendix pp 151–164). This pattern was even more pronounced in the corporate health-care sector, which might be expected to be the global leader in addressing links between health and climate change. In 2018, although most companies in the health sector referred to health (72%) and an increasing minority to climate change (47%), only 12% made a conjoint reference to both.

Conclusion

Engagement by all sectors of society is essential if action on climate change is to be mobilised and sustained. Section 5 has focused on key domains of engagement,

including the media, governments, the corporate sector and, in a new indicator, individual-level engagement. Each sector is recognised to be central to moving global emissions onto a pathway that maintains global temperature increases to below 1.5°C.²¹¹

Two broad conclusions can be drawn from the analyses presented in section 5. First, engagement in health and climate change has increased over the last decade, with a more pronounced upward trend for engagement by the media and government than by the corporate sector. With respect to the elite media, there is evidence of informed and detailed engagement with the health impacts of climate change and with the co-benefits of climate change action. At the global forum of the UN General Assembly, an increasing number of countries are giving attention to the health–climate change nexus. Led by the small island developing states, these countries are underlining the north–south inequalities in responsibility for, and vulnerability to, climate change and its adverse health impacts.

Although media engagement is increasing, it is episodic rather than sustained, with so-called issue attention increasing at key moments in global climate governance, particularly the UNFCCC COPs. The role of the COPs in public and political engagement has been noted in other reports,^{195,212} with the meetings providing a global stage for both national leaders and non-government organisations (including scientists, religious leaders, and health professionals), to contribute to the public debate. The pattern for the corporate sector, including the health-care sector, is different; it does not display spikes in engagement linked to the global governance of the planet.

Second, although engagement has increased over the past decade, these indicators suggest that climate change is being more broadly represented in the media and by governments in ways that do not connect it to human health. As this suggests, the human face of climate change can be easily obscured and the analysis of individual engagement illustrates this pattern. The online footprint of Wikipedia users confirms that although health is a major area of individual interest, it is rarely connected with climate change. In the mind of the public, health and climate change represent different and separate realms of knowledge and concern and, when connections between the two areas are made, this is driven by an interest in health rather than in climate change.

Taken together, these two conclusions point to modest progress in making health central to public and political engagement in climate change, but underline the challenge of mobilising action at the speed and magnitude required to protect the health of the planet and its populations.

Conclusion: The Lancet Countdown in 2019

The *Lancet* Countdown: tracking progress on health and climate change was formed 4 years ago, building on the work of the 2015 *Lancet* Commission. It remains

committed to an open and iterative process, always aiming to strengthen its methods, source new and novel forms of data, and partner with global leaders in public health and in climate change. The 41 indicators presented in the 2019 report represent the consensus and work of the past 12 months and are grouped into five categories: climate change impacts, exposures, and vulnerabilities; adaptation, planning, and resilience for health; mitigation actions and health co-benefits; economics and finance; and public and political engagement.

The data published here elucidate the ongoing trends of a warming world with effects that threaten human wellbeing. As the fourth hottest year on record, 2018 saw a record-breaking 220 million additional exposures to extremes of heat, coupled with corresponding increased vulnerability to heat across every continent. As a result of this and broader climatic changes, vectorial capacity for the transmission of dengue fever was the second highest recorded, with 9 of the past 10 most suitable years occurring since 2000. Progress in mitigation and adaptation remains insufficient, with the carbon intensity of the energy system remaining flat; 2·9 million ambient air pollution deaths; and a reversal of the previous downward trend of coal use.

Despite this slow progress, as the material effects of climate change reveal themselves, so too does the world's response. 51 of the 101 countries tracked have developed national health adaptation plans, 70 countries provide climate information services to the health sector, 109 countries have medium to high implementation of a national health emergency framework, and 69% of cities have mapped out risk and vulnerability assessments. Health adaptation funding continues to climb, with health-related funding now responsible for 11·8% of the global adaptation spend. Finally, public and political engagement continues to grow, with heightened interest around the school climate strikes, the UNFCCC's annual meetings, and divestment announcements from medical and health associations.

The last three decades have witnessed the release of increasingly concerning scientific data showing the importance of a reduction in greenhouse-gas emissions. Although the report discusses several positive indicators, CO₂ emissions continue to rise. The health implications of this are apparent today and will most certainly worsen without immediate intervention.

Despite increasing public attention over the past 12 months, the world is yet to see a response from governments which matches the scale of the challenge. The role of the health profession is essential—communicating the health risks of climate change and driving the implementation of a robust response which will improve human health and wellbeing.

With the full force of the Paris Agreement to be implemented in 2020, a crucial shift must occur—one which moves from discussion and commitment, to meaningful reductions in emissions.

Contributors

The *Lancet* Countdown: tracking progress on health and climate change is an international multidisciplinary collaboration that builds on the foundation work of the 2015 *Lancet* Commission on health and climate change, convened by *The Lancet*. The *Lancet* Countdown's work for this report was done by its five working groups, each of which were responsible for the design, drafting, and review of their corresponding indicators and sections. All authors contributed to the overall structure and concepts of the report and provided input and expertise to the relevant sections.

Authors contributing to Working Group 1 included Nigel Arnell, Jonathan Chambers, Luis E Escobar, Ilan Kelman, Tord Kjellstrom, Bruno Lemke, Yang Liu, Rachel Lowe, Jaime Martinez-Urtaza, Maziar Moradi-Lakeh, Kris Murray, Fereidoon Owfi, Mahnaz Rabbaniha, Elizabeth Robinson, Jan C Semenza, Meisam Tabatabaei, and Joaquin Trinanes. Authors contributing to Working Group 2 included Sonja Ayeb-Karlsson, Peter Byass, Diarmid Campbell-Lendrum, Robert Dubrow, Kristie L Ebi, Lucia Fernandez Montoya, Lucien Georgeson, Jeremy Hess, Dominic Kniveton, Mark Maslin, Karyn Morrissey, Tara Neville, Maria Nilsson, Maquins Odhiambo Sewe, Dung Phung, Joacim Rocklöv, and Joy Shumake-Guillemot. Authors contributing to Working Group 3 included Markus Amann, Kristine Belesova, Carole Dalin, Michael Davies, Matthew Eckelman, Ian Hamilton, Stella Hartinger, Gregor Kiesewetter, Melissa Lott, James Milner, Tadj Oreszczyn, David Pencheon, Steve Pye, Ruth Quinn, Jodi Sherman, Jonathon Taylor, and Paul Wilkinson. Authors contributing to Working Group 4 were Paul Drummond and Paul Ekins. Authors contributing to Working Group 5 included Maxwell Boykoff, Wenjia Cai, Stuart Capstick, Meaghan Daly, Niheer Dasandi, Paul Haggard, Hilary Graham, Lucy McAllister, Slava Jankin Mikhaylov, and Olivia Pearman. The coordination, strategic direction, and editorial support for this paper was provided by Anthony Costello (Co-Chair), Hugh Montgomery (Co-Chair), Peng Gong (Co-Chair), Nick Watts (Executive Director), and Alice McGushin (Programme Manager). The findings and conclusions in this Review are those of the authors and do not necessarily represent the official position of the European Centre for Disease Prevention and Control, WHO, the World Bank, or the World Meteorological Organization.

Declaration of interests

The *Lancet* Countdown's work is supported by an unrestricted grant from the Wellcome Trust (209734/Z/17/Z). The *Lancet* Countdown covered travel costs for meetings related to the development of the paper. Ten of the authors were compensated for their time while working on the drafting and development of the *Lancet* Countdown's report (NW, AM, MB, JC, MD, PD, GK, LM, OP, and RQ). The work of MB was supported by the Cooperative Institute for Research in Environmental Sciences, University of Colorado Boulder. The work of CD was supported by the Natural Environment Research Council, and the input of CD and RQ contributes to the Sustainable and Healthy Food Systems programme supported by the Wellcome Trust's Our Planet, Our Health programme. The work of MD and JT was supported by the Wellcome Trust Complex Urban Systems for Sustainability and Health project. RD would like to acknowledge funding from the Overlook International Foundation. HG would like to acknowledge funding from C & JB Morrell Trust Priming Fund. IH and TO would like to acknowledge funding from the Engineering and Physical Sciences Research Council Centre for Research in Energy Demand Solutions grant. The work of YL was supported by the NASA Applied Sciences Program. The work of HM is partially funded by the National Institute for Health Research's Biomedical Research Centre at University College London Hospitals NHS Trust. DP would like to acknowledge funding from the 2018 Australian Endeavour Research Fellowship. JT would like to acknowledge funding from the National Oceanic and Atmospheric Administration's OceanWatch and Atlantic Oceanographic and Meteorological Laboratory, and the support of Universidade de Santiago de Compostela Instituto de Investigaciones Tecnológicas and University of Miami Cooperative Institute for Marine and Atmospheric Studies.

Acknowledgments

We thank the Wellcome Trust, in particular Howard Frumkin, Madeleine Thomson, and Lukasz Aleksandrowicz, for financial and strategic support, without which this research collaboration would not

be possible. While carrying out its work, The *Lancet* Countdown received invaluable technical advice and input from several individuals, including Heather Adair-Rohani (WHO), Susan Anenberg (George Washington University), Maximilian Bayer and Yuan Ting Lee (Hertie School), Andrew Benham, Patrick Chandler, Lauren Gifford, Jennifer Katzung, Marisa McNatt, Ami Nacu-Schmidt, David Oonk, and Jeremiah Osborne-Gowey (University of Colorado Boulder), Simon Bennett, John Dulac and Wataru Matsumura (International Energy Agency), Helen Berry and Anthony Capon (University of Sydney), Christopher J Boyer (University of Washington), David Briggs, Chris Freyberg, Jason Lee (National University of Singapore), Kimberly M Carlson (University of Hawai'i), Jinfeng Chang (International Institute for Applied Systems Analysis), Tim Colbourn (University College London), Rita R Colwell (University of Maryland), James S Gerber (University of Minnesota), Mario Herrero (Commonwealth Scientific and Industrial Research Organisation), Thomas Kastner (Senckenberg Biodiversity and Climate Research Centre), Long Lam (Navigant), Gabriel F Mantilla-Saltos (Escuela Superior Politécnica del Litoral), Gerardo Martin (Imperial College London), Matthias Otto (Nelson Marlborough Institute of Technology), Jonathan Patz (University of Wisconsin-Madison), Matthew Prowse (IBISWorld), Pete Smith (University of Aberdeen), and Bryan Vu (Emory University). SAK would like to acknowledge the support of the UN University Institute for Environment and Human Society. Administrative, policy, and communications advice was provided by Peter Chalkley (Energy and Climate Intelligence Unit), Andrew Child (Consultant), Tan Copey and Paige Knappenberger (Climate Nexus), Rachael Davies (Consultant), Sarah Hurtes (European Climate Foundation), Hannah Jennings, Tanya Nour (University College London), and Jessica Beagley, Anjuli Borgonha, Laura Donovan, and particularly Marina Romanello (The *Lancet* Countdown).

carol uschyk

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

I want to touch on two topics that are a constant refrain from proponents of this project.

One. We need jobs, this is good for our families good for our economy good for our spiritual health, the underlying implication: environmentalist, the do gooders are taking food from our babies.

I reject those testimony implications here that there are opposing sides and one is right and one is wrong. We have a common interest in human survival and sustainable livelihoods. "If God had intended some people to fight just for the environment and others to fight just for the economy he would have made some people who could live without money and others who could live without water and air. There are not two groups of people here, environmentalists and workers. We all work, we all need a livelihood and we all need a livable planet. If we don't address both we'll starve together while we're waiting to fry together.

Two. Most of the proponents have latched on to Nick Caudill's charts and explanations showing just how much better this project is going to be than using coal as a fuel source. It's a hard argument to counter because they're right. This project likely would have lower emissions than coal as a fuel source. But comparing only two huge greenhouse gas emitting projects to each other surely cannot be the way to evaluate a project unless you have the kind of unassailable information that no one in their right mind would claim to have: that plastic from fossil fuels is here to stay for the next 40 years, and that China will never build another coal fired plant producing methanol if this one is built. I don't care what cool looking persuasive charts Nick makes to show us the emissions, the entire underlying assumption is dead wrong. The information required to support these assumptions is now not known. It's not like climate science where you have scientific models produced by international coalitions of scientists—which by the way have consistently underestimated our worsening climate. It's like guessing which stocks are going to go up in the stock market for the next 40 years. It cannot be done.

Testimony of unemployed trade union workers tears at everyone's hearts, stories of climate catastrophe tears at everyone's hearts too. But it's not Ecology's job to find jobs for construction trades. That's for the legislature. It's their job to figure out how to support renewable energy projects. Your job is much more limited in scope. Your job is to protect the environment "for future generations" as stated in your mission statement. Viewing this project as a stand alone application and not making these unfounded assumptions for the next 40 years, this project surely fails by virtue alone of the ~~4,600,000~~ tons of greenhouse gases it will emit every single year.

~~millions + millions~~
↓ millions + millions

I'm opposed to the proposed Kalama Manufacturing and Marine Export Facility in any form. I've lived in the Pacific Northwest for over 40 years and have loved being on the shorelines of our great waters while camping, rafting, kayaking, fishing, hiking and cycling. There is a complete disconnect between the very idea of shoreline that most of us cherish and what the applicant intends to do with the shoreline in Kalama. From the Shoreline Management Act: "The SMA establishes the concept of preferred shoreline uses. These uses are consistent with controlling pollution, preventing damage to the natural environment, or are unique to or dependent upon use of Washington's shorelines." How can this use possibly be consistent with the mission of the Shoreline Act itself. Words matter.

This use stands in complete opposition to the goals Ecology sets forth on its website that "Washington is a national leader in cutting greenhouse gas emissions to prevent climate change. Gov. Jay Inslee and the Washington Legislature have adopted a variety of regulations, programs, and initiatives designed to reduce greenhouse gas emissions. Ecology stands proud to protect, preserve and enhance Washington's environment for current and future generations." Again, words matter.

And as far as mitigation is concerned, I don't see how you can speculate about future energy decisions in foreign energy markets. No one can successfully predict the stock market day to day much less the 14,600 days of this project's length that applicant insists will be high demand for its product. By the way are they making fuel like they told their investors or plastic like they lied to you? I've watched too many tv police dramas not to know that if you lie to me about what you said then how can I know you're not lying to me now. It's not Ecology's job to try to figure out which of applicant's statements are lies and which are truths. It's too late for that and I hope too late for this applicant to lay waste to beautiful Kalama.

Kathleen Jonsson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Tosha Mayo

Julie Raggio

We need immediate action in the climate crisis, and accepting NWIW's proposal is not the option. I have two teenagers, and I do not want them to inherit an unlivable planet. Please make the choice to prevent this plant to protect our communities. The project would emit a mountain of CO₂, and cause great damage to Washington's community, as well as to people in Oregon and British Colombia. Please reject this proposal. Thank you.

Cameron Cover

Nick Cover

We need immediate action in the climate crisis, and accepting NWIW's proposal is not the option. I am 14 years old, and I do not want to inherit an unlivable planet. Please make the choice to prevent this plant to protect our communities. The project would emit a mountain of CO₂, and cause great damage to Washington's community, as well as to people in Oregon and British Colombia. Please reject this proposal. Thank you.

Mirabai Peart

Hi, I'm Mirabai Peart, I live in Portland, OR.

Last Christmas, visiting family in Australia, we feared for our lives, as 46 million acres burned in fires unlike we'd ever seen. Now, here in the West Coast, we experience the same unprecedented destruction from 'climate fires', as the California Governor rightly calls them. Right here and all over the globe, fires rage, glaciers and polar ice steadily melt at alarming rates. Climate change is happening now. We are in a crucial time regarding the survival of humankind and life as we know it.

It is our serious responsibility now to outright reject any new fossil fuel infrastructure and we must deny the Kalama Methanol Refinery. Instead we can create jobs and careers within sustainable industries.

The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an outright nonsensical evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not.

We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution, and use more fracked gas than all of Washington's gas-fired power plants combined.

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's be bold, and redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Thank you.
Mirabai

Hillary MacDonald

We need immediate action in the climate crisis, and accepting NWIW's proposal is not the option. I have a teenage son, and I do not want him to inherit an unlivable planet. Additionally, the seismic activity in the PNW has the potential to create a disaster if this project moves forward. Please make the choice to prevent this plant to protect our communities. The project would emit unacceptable levels of CO₂, and cause great damage to Washington's community, as well as to people in Oregon and British Colombia. Please reject this proposal. Thank you.

Melissa Mager

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Mark or Uhart

My name is Mark Uhart and I am a retired US Army career officer. My wife and I live near Kalama in the foothills overlooking the Columbia River. We are against this project. We purchased this property so we could enjoy the unobstructed view of the Columbia River and enjoy recreation and dining in the local area. We walk, hike, bicycle, and have kayaked the Columbia River. One of my hobbies is wildlife, landscape and astrophotography, all of which will be affected by this project.

Most importantly, I am concerned about the future of my children and grandchildren. It's hard for me to comprehend why anyone in this area would support a project that will adversely impact their health, safety, and long-term quality of life. The short-term economic gain will be offset by 40 years of dirty air and water, noise and landscape pollution, depletion of the Columbia River-Kalama River aquifer, and a definite impact on our climate. I grew up in southern California next to oil fields and refineries. I've lived in Texas and observed the stinky and noisy refineries along the coastline. Trust me, we don't want the smell, the noise, the air and water, and landscape pollution of this facility.

I served 21 years as an active duty officer in the Army from battery to Corps Artillery level, and an assignment in special weapons quality assurance. The strategic objective of our adversaries, Russia and China, were always part of our professional development. I was, and still am, very aware of the strategic implications of foreign countries' attempts to get deeply embedded into our financial system in order to influence both economic and military outcomes. One author says it best, "The signs that China is gearing up to contest America's global leadership are unmistakable, and they are ubiquitous." They are doing it with our money and our natural resources. When will the average Washington resident wake up and smell the coffee?

It really bothers us that the US citizens of Northwest Innovation Works (NWIW), the Port of Kalama and the Cowlitz County commissioners, would support a project that is owned by the Chinese government; that will be financed primarily by US Government and Washington taxpayers; that will pollute our air and water; and only add to the devastating effects of anthropogenic (human-caused) climate change. We will bear most of the financial and environmental risks associated with this project while they take in the profits and improve their position toward world financial, economic, Southeast Asia maritime and political dominance. Money talks and the Chinese government are throwing a lot of money into marketing this project in its quest to control much of the world's technology and energy natural resources by 2030.

An assumption that was not stated, but can be inferred from these EISs, is that the international community will choose not to address climate change and regulate GHGs. If every country that wants to improve their energy position and economy, like China and the US, took the same approach purported in this report, then the earth is doomed. The assumption is that if this plant is not built herein Kalama, it will be built elsewhere. The law of supply and demand shows that if there is a shortage of a commodity, and prices increase, people will use it less and seek alternate technologies. We saw this before the fracking boom when gas prices went up. That drove better fuel efficiency and new technology (all electric cars, hybrid vehicles, and now fuel-cell vehicles.) Denying these projects will constrain these fossil fuel supply channels and force countries to develop clean, non-fossil fuel, energy alternatives.

I read the SSEIS and the voluntary mitigation framework presented in Appendix D is laughable. By using the term "in-state", NWIW is not willing to mitigate GHGs outside the state of Washington. This includes the upstream fugitive methane and CO2 from the methanol burned in transport to China, and as a fuel or in olefin production. I will address this further in another comment.

This project is a climate killer and the only responsible decision is for Ecology to deny the shoreline permit.

Mark Uhart
LTC, USA Ret.
Kalama, WA

Mark Uhart

My name is Mark Uhart and my wife and I live near Kalama. I appreciate the opportunity to comment on the SSEIS. Thank you Ecology for providing this opportunity.

What are the long-term social and economic costs if the KMMEF and other fossil fuel projects are approved? We are at a tipping point, best described by higher temperatures that are melting glaciers and snow packs, changing how our earth reflects or absorbs sunlight. We are seeing biome shifts that are changing how plants and animals survive during extreme heat and cold weather, uncharacteristic of the geography. We are seeing circulation changes in the atmosphere and oceans bringing extreme conditions that our fisheries and aquatic plants cannot survive. We are at a tipping point and a slower rate of fossil fuel consumption is not going to forestall global warming. We must stop it now. We are living with the effects of fossil fuels consumed as far back as 100 years ago. The GHGs emitted by this plant will impact at least 10 future generations. The last time the earth warmed this rapidly was 56 million years ago.

The framework for the economic analysis presented in Section 3.4.5 of the SSEIS is flawed, as it focused only on GHG emission alternatives. It doesn't address the negative economic impacts from climate change, only the positive ones. The SSEIS fails to address the following economic costs:

- o The cost of fighting wildfires and the subsequent disaster relief.

What will be the firefighting and disaster relief costs to the state and those affected by the fires.

- o The cost of lost timber harvests as a result of wildfires?

How many logging truck drivers, lumber mill and lumber exporting employees will lose their jobs?

- o Decreasing timber harvests as a result of hotter and drier weather.

How will the lower timber yields affect jobs and revenue from state lands?

- o Loss of commercial fishing revenue, directly and indirectly, as a result of decreasing salmon, steelhead and shellfish harvests.

How will this affect the fisherman, the processors, resellers, merchants, and state tax revenue?

- o State and Federal disaster monies committed due to extreme weather events and fishery disasters.

How will this affect the state budget? Higher taxes?

- o Repairs to public roads and utilities as a result of extreme weather events.

How will this affect our state budget?

Higher taxes?

- o Loss of property and productivity due to extreme weather events.

Why wasn't there an attempt to quantify these costs? How will this affect residential property values for homes with a view of the Columbia River?

- o Effects on human health?

What are the costs associated with the increased PM2.5 air pollution and water pollution.

- o Increased healthcare costs?

What are the associated healthcare costs based on scientific studies of similar plants?

Lastly, none of the EISs make any assumptions about future possible actions by nations of the world, under the Climate Change Accord, to limit the consumption of fossil fuels or pay penalties for their GHG emissions. The day will come when the KMMEF investors will have pay for the GHGs for which this plant is responsible, just like the TransAlta coal-fired plant in Centralia, which must be shut down by 2025. What if Washington passes a cap and trade bill that requires NWIW, or

its successors and assigns, to pay for the GHGs for which it is responsible, to include upstream and downstream GHGs? What if the members of the OECD, of which the US is a member, enforces a cap and trade system? How will this affect the long-term profitability of the KMMEF? These are all risks that were not addressed in any of the EISs.

The flawed framework used for this economic analysis is just one of the many shortcomings I found in the SSEIS. We encourage you to reject this project.

Mark Uhart

Donna Browne

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Wesley Allen

I ask that Ecology reject the Methanol refinery and deny the Shorelines permit. Ecology must use science-based analyses to evaluate the true, whole impact of this destructive project, not just its local consequences.

This project would cause millions of tons of greenhouse gas pollution. Permitting it would renege on WA state's climate goals.

Can't we measure this project by what's possible, what's meaningful, and what's needed for a thriving Kalama and sustainable future? Stating that methanol is "better than coal" orients us to past inadequacies, but doesn't help us imagine the future. It might be better to lose an arm than a leg, but that doesn't mean that either is good. Ecology should focus on the real-world, known pollution that would come from the methanol refinery, rather than NWIW's silly 'displacement' argument.

Washington must keep its promise to be a leader in keeping global warming under 2 degrees Celsius. We cannot further entrench ourselves in fossil fuels.

Please reject this project. Please deny the permit.

Thank you.

Marianna Grossman

September 22, 2020

Kalama Manufacturing and Marine Export Facility Public Hearing testimony

Dear Mr. Zenk:

Thank you to you and your Ecology Dept. colleagues for setting up hearings. Here is the text of what I presented verbally this evening.

I am Marianna Grossman. I live in Portland Oregon. I strongly oppose this plant and agree with the concerns others have expressed about the climate and pollution costs of this refinery.

The State of Washington must meet its climate goals and set an example for other states so that humanity has a chance of limiting global warming to 1.5C. We can see that our current trajectory is already resulting in catastrophic fires, storms, smoke and enormous social, environmental and economic costs.

I am troubled by the unnecessary conflict expressed today between good paying jobs and human and environmental health and well being.

One example of a community that shifted from fossil fuels to locally produced bio and renewable energy is Gussing a small town in Austria, near the Hungarian border. Now they produce high quality jobs in clean energy production, technology research and innovation. They even had to build a hotel to support visitors coming to study their transformation and the technology and economic models they innovated. We should do this in our region too. We can increase forestry and agricultural jobs as well as technology and hospitality jobs by investing in all of our futures.

The initial investment in Gussing's transformation came from a combination of sources: the EU, the Austrian Department of Environment, local government and private investors.

The region went from out-migration for work and spending on fossil fuels to innovative new businesses, including an eco-industrial system where waste saw dust from the veneer/furniture plant is used to power heat for the noodle factory which uses eggs from local chickens and creates zero CO2 noodles, as one example.

Here is information about Gussing achieving zero GHG emissions.
<https://www.100-percent.org/gussing-austria/>

Here is more information about the technology and economic impact of their regional transformation.
https://ec.europa.eu/regional_policy/en/projects/austria/new-formula-for-renewables-revolutionises-gussing

To quote the European Union website report this has been a profitable investment:

"The plant gets around 15 euro cent per kWh for its electricity. This is much less than the price, around 25 euro cent, being paid by domestic consumers in the area. It is estimated that this plant, together with another wood-fired heating system with a capacity of 42 MW, means that 18 million stays in the district each year that would otherwise have leaked out. This represents massive return on investment.

The availability of cheap heat (30% cheaper) has led to over 1,000 new jobs being created in and around the town, including 100 in a new office building on an industrial estate which

houses the European Centre for Renewable Energy. This employs 12 people itself and the other people renting space in the building are mostly from companies or consultancies to do with renewable energy. One of the centre's activities is arranging visits for the increasing number of visitors who come to see what G♠ssing has done, an activity which itself creates employment in hotels and restaurants.

By making the switch from fossil fuels to renewables, the people of G♠ssing are now more than self-sufficient for electricity and heat."

They raise agricultural crops for biomass as well as using cultivation techniques to remove excess vegetation from surrounding forests and strategically located solar energy generation, as well.

This transformation was designed to lift the well-being of all the residents of this small town and rural community. We should do the same in our own communities.

Sincerely yours,

Marianna Grossman
Portland, OR

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's be bold, and redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Thank you.
Brett

Michael Kennedy

Right here and all over the globe, fires rage. Glaciers and polar ice steadily melt at alarming rates. Climate change is happening now. We are in a crucial time regarding the survival of humankind and life as we know it.

It is our serious responsibility now to outright reject any new fossil fuel infrastructure and we must deny the Kalama Methanol Refinery. Instead we must look to create jobs and careers within sustainable industries.

The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an outright nonsensical evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not.

We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution, and use more fracked gas than all of Washington's gas-fired power plants combined.

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's be bold, and redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Jean Avery

It is important to remember the history of this place we call home. The area we're talking about is the ancestral homeland of Native Americans. Indigenous peoples continue to honor Mother Earth through sustainable stewardship and cultural traditions.

Natural areas and wildlife in SW Washington are at risk with the NWIW project because of air pollution and increased vessel traffic. Several of these natural areas are designated as IBA's: Important Bird and Biodiversity Areas. IBA's are internationally recognized as globally important for the conservation of bird populations. The "Washington State Birding Trail" includes these IBA's close to Kalama:

- J.B. Hansen National Wildlife Refuge: 6,000 acres of Columbia River islands and sloughs.
- Chinook County Park and the 1,900 acre Cape Disappointment State Park.
- Ridgefield National Wildlife Refuge, 5,000 acres of wetlands, grasslands, and woodlands.
- Vancouver Lake Park and Columbia River Lowlands are also designated as IBAs.

The NWIW plant would degrade the area's air and water, threatening natural areas and wildlife. Yet none of these significant impacts are included in the SSEIS.

I would like to end with this Native American proverb:

Listen to the Wind; it talks.
Listen to the Silence; it speaks.
Listen to your Heart; it knows.

(Presented as oral testimony Tuesday evening, 9/22/2020)

Brett Ensor

Washington Dept. of Ecology Sept. 22, 2020

Attn.: Rich Doenges

PO Box 47775

Olympia, WA 98504-47775

Hi, I'm Brett Ensor, I live in Kirkland, Washington.

Right here and all over the globe, fires rage. Glaciers and polar ice steadily melt at alarming rates. Climate change is happening now. We are in a crucial time regarding the survival of humankind and life as we know it.

It is our serious responsibility now to outright reject any new fossil fuel infrastructure and we must deny the Kalama Methanol Refinery. Instead we must look to create jobs and careers within sustainable industries.

The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an outright nonsensical evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not.

We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution, and use more fracked gas than all of Washington's gas-fired power plants combined.

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's be bold, and redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Thank you.

Brett

Bridget Irons

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Patricia Kullberg

September 23, 2020

To the Washington State Department of Ecology:

Thank you for this opportunity to testify today in opposition to the proposed methanol refinery in Kalama. My name is Patricia Kullberg. I am a retired physician and public health official, a member of Oregon Physicians for Social Responsibility and a life-long resident of the Pacific Northwest. I recently spent more than a week confined to my home in Portland because the smoke-filled air outside was too hazardous to breathe. Fires were consuming forests west of the Cascades, which in my seven decades in Oregon have never burned, because normally they are too wet. Climate change is not something off in the future. It's here and it's now. For this reason I find the draft Second Supplemental Environmental Impact Statement (SSEIS) for Kalama Manufacturing and Marine Export Facility (KMMEF) a shockingly reckless document. At a time when we should be pulling out all stops to avert climate disaster, this analysis represents nothing more than business as usual. Despite presenting a dizzying array of future scenarios, the analysis makes unsupportable claims about corporate behavior, makes highly speculative assumptions about market trends, and forecloses on the very opportunities we have to save our way of life in the Pacific NW.

After so much documentation about how Northwest Innovation Works (NWIW), the company behind KMMEF, has misled the public about its intentions for marketing the methanol it generates, it is unbelievably naïve to take their current statement of intent to target the plastics industry at face value. To assume that at most 40% of the methanol will be marketed as fuel is a fantasy. NWIW will market their methanol in whatever way they please to turn a profit, even if that means 100% of their product is used as fuel. Given that the plastics industry itself is subject to increasing regulatory demands, that 40% assumption seems particularly untenable.

The SSEIS assumes that the market for methanol will continue to grow unabated for the next 40 years, once it recovers from the current pandemic-induced contraction. Underlying this assumption are many more: that we will never be faced with another pandemic, which is not what the infectious disease experts are telling us; that there will be global political and economic stability, which is difficult to imagine in an era of increasing numbers of nation-states ready to conduct trade wars and withdraw from long-standing regional economic relationships, plus the social unrest and dislocation associated with massive climate induced migration; that the regulatory environment will remain unchanged when countries all over the globe are looking for ways to reduce their carbon footprint. But most egregious of all is the total lack of consideration in the SSEIS for true alternatives to the climate-destroying fossil fuels. Coal-based production of plastics in China should not be our benchmark for comparison. Anything better than coal is not the policy that will spare the planet. We should be bench-marking against climate-saving scenarios, for example, a ban on single-use plastics, which alone would reduce the production of plastics by up to 40%. Or a ban on methanol and coal based production of plastic in favor of naphtha-based production, which method results in the lowest net greenhouse gas (GHG) emissions. Allowing the KMMEF proposal to move forward not only locks the community of Kalama into supporting an industry that is doing immeasurable harm to our planet, it will have the effect of squeezing renewable sources of energy out of the market. Additionally it risks sending Kalama into a boom-bust cycle. After a significant contraction in the market for methanol, which is hardly a rash prediction, the community would be saddled with all the costs of a stranded asset. You can be sure that NWIW will not be picking up the tab.

I, like most residents of the Pacific Northwest, am devoted to our way of life here. We should be

promoting projects that protect and preserve our natural resources like our forests, our abundant and clean water and our clean air, not projects that will only hasten their destruction.

Respectfully submitted,

Patricia Kullberg, MD MPH

Kathy Wolff

Washington Dept. of Ecology Sept. 23, 2020

Attn.: Rich Doenges

PO Box 47775

Olympia, WA 98504-47775

Greetings,

My name is Kathy Wolff and I've lived in Portland for the past 16 years. I have fourteen close members of my family who live in Portland too, most importantly (to me) are my two young grandsons.

Our planet is in an escalating crisis that threatens human life on earth. The results of climate change are happening all around the globe and right here in our northwest with this summer's unprecedented fires. The Northwest charted the worst air quality in the world for weeks on end. Fires rage across our planet. Glaciers and polar ice steadily melt at alarming rates. Hurricanes and super storms are no longer "once in 500 year events" but happening sometimes more than once a year. Mass extinction of the animal and plant kingdoms is documented. Plastics already clogs huge areas of our oceans, destroying marine life. Climate change is happening now. We are in a crucial time regarding the survival of humankind and life as we know it.

It is our serious responsibility now to outright reject any new fossil fuel infrastructure and we must deny the Kalama Methanol Refinery. Instead we must look to create jobs and careers within sustainable industries.

The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an outright nonsensical evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not.

We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution, and use more fracked gas than all of Washington's gas-fired power plants combined.

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

We MUST redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, my kids and your kids, my grandsons, Ollie and Max, and your grandkids, and all future generations.

I appeal to you, please work tirelessly to do whatever is necessary to reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Thank you.
Kathy Wolff

Renee Lang

Renee from Tacoma WA

I'm a working mother of two handsome boys. We spend a lot of time in SW Washington camping, hunting, fishing and working. I've worked in construction my whole life and I'm very thankful to have had a job through out COVID-19. Not only is this Project necessary for our environment and future for our children, it will also bring jobs to our community.

I am in support of the Kalama Project and appreciate the review done by the Department of Ecology. This project sets new High standards for development in Washington State and lead other states. Please approve this project as a great example to drive those high standards.

Thank you , Department of Ecology. Good Work!!

Please proceed swiftly to allow positive impacts.

Marianna Grossman

September 22, 2020

Kalama Manufacturing and Marine Export Facility Public Hearing testimony

Dear Mr. Zenk:

Thank you to you and your Ecology Dept. colleagues for setting up hearings. Here is the text of what I presented verbally this evening.

I am Marianna Grossman. I live in Portland Oregon. I strongly oppose this plant and agree with the concerns others have expressed about the climate and pollution costs of this refinery.

The State of Washington must meet its climate goals and set an example for other states so that humanity has a chance of limiting global warming to 1.5C. We can see that our current trajectory is already resulting in catastrophic fires, storms, smoke and enormous social, environmental and economic costs.

I am troubled by the unnecessary conflict expressed today between good paying jobs and human and environmental health and well being.

One example of a community that shifted from fossil fuels to locally produced bio and renewable energy is Gussing a small town in Austria, near the Hungarian border. Now they produce high quality jobs in clean energy production, technology research and innovation. They even had to build a hotel to support visitors coming to study their transformation and the technology and economic models they innovated. We should do this in our region too. We can increase forestry and agricultural jobs as well as technology and hospitality jobs by investing in all of our futures.

The initial investment in Gussing's transformation came from a combination of sources: the EU, the Austrian Department of Environment, local government and private investors.

The region went from out-migration for work and spending on fossil fuels to innovative new businesses, including an eco-industrial system where waste saw dust from the veneer/furniture plant is used to power heat for the noodle factory which uses eggs from local chickens and creates zero CO2 noodles, as one example.

Here is information about Gussing achieving zero GHG emissions.
<https://www.100-percent.org/gussing-austria/>

Here is more information about the technology and economic impact of their regional transformation.
https://ec.europa.eu/regional_policy/en/projects/austria/new-formula-for-renewables-revolutionises-gussing

To quote the European Union website report this has been a profitable investment:

"The plant gets around 15 euro cent per kWh for its electricity. This is much less than the price, around 25 euro cent, being paid by domestic consumers in the area. It is estimated that this plant, together with another wood-fired heating system with a capacity of 42 MW, means that 18 million stays in the district each year that would otherwise have leaked out. This represents massive return on investment.

The availability of cheap heat (30% cheaper) has led to over 1,000 new jobs being created in and around the town, including 100 in a new office building on an industrial estate which

houses the European Centre for Renewable Energy. This employs 12 people itself and the other people renting space in the building are mostly from companies or consultancies to do with renewable energy. One of the centre's activities is arranging visits for the increasing number of visitors who come to see what G♠ssing has done, an activity which itself creates employment in hotels and restaurants.

By making the switch from fossil fuels to renewables, the people of G♠ssing are now more than self-sufficient for electricity and heat."

They raise agricultural crops for biomass as well as using cultivation techniques to remove excess vegetation from surrounding forests and strategically located solar energy generation, as well.

This transformation was designed to lift the well-being of all the residents of this small town and rural community. We should do the same in our own communities.

Sincerely yours,

Marianna Grossman
Portland, OR

Portland, OR

Dashiell Glenn

The world does not need more plastic right now. I find it everywhere I go, in the city and in the mountains. Do the Columbia a favor and keep this plant from being built.

Eileen Fromer

My name is Eileen Fromer. I live in Portland and I am passionate about the climate crisis and stopping greenhouse gas emissions. I believe that the Department of Ecology has an opportunity through its analysis and these hearings to do the right thing: simply, that is to deny the Shorelines Permit for the Kalama Methanol Refinery.

On its website, Ecology states "Washington is a national leader in cutting greenhouse gas emissions to prevent climate change." Now they state that the Kalama refinery would be one of the top greenhouse gas polluters in Washington emitting 4.6 million tons of carbon pollution annually...for 40 years. How on earth can Ecology claim to be cutting greenhouse gas emissions and approve this shoreline permit?

The Kalama fracked gas to methanol refinery will in no way cut greenhouse gas emissions to prevent climate change.. They mention mitigation. Mitigation is a pipedream in the Ecology analysis. It's meaningless.

But what is not meaningless is the underestimated methane leakage from fracking natural gas, transmission along the pipe route and at the refinery. And after the methanol leaves the refinery....what then?

First, it was only going to be used to make plastics...as if plastics are not already an environmental disaster, but at least the methanol wouldn't be burned for fuel. Then, NWIW changed their story so 40% might be burned as fuel yielding 2 million tons of carbon pollution each year. And, there is no guarantee that all the methanol won't be burned. That would mean 5 million tons of pollution a year. In other words, NWIW will do whatever they want with it and never mind their claims and never mind the environmental impacts.

This refinery would increase Washington's global warming impact by 10% and in just 5 years, by 2025, this refinery could be the largest polluter in the state.

We are in a climate crisis. The wildfires are here along with drought, storms, floods and displaced people all over the world. It's time to say 'no' ♦ enough is enough. Washington and the Dept. of Ecology must live up to their claim and be a leader in addressing the climate crisis.

Peter Fink

If you're told you're an alcoholic and you need to quit or it will kill you, you don't go out and buy a bunch of drinks to stock your liquor cabinet—even if the alcohol content is lower than something else. Why not? Because why pay all that money for a bunch of drinks you know you shouldn't drink and will have to toss soon after? And perhaps more importantly, so long as that bottle of wine is there it will tempt you, and you'll want to get your money's worth.

We have been told we have 20 years before the worst of the climate emergency's wrath will be fully inflicted. The cause? A terrible dependency on fossil fuels which with each ton burned will worsen the situation. In those 20 years every ton burned will bring flooding to Southeast Asia, and the American South, drought to the Sahel and California, and fires there and in Australia, the Amazon, and the Congo Basin. Millions will be displaced, sickened, or killed; thousands of species will go extinct. So if the prognosis is to quit fossil fuels the last thing we should be doing is investing in that infrastructure. It is a waste of money if we get our act together and decide to never use it just a few years after it's built. It's a waste of money if we use it for 30 years and have to spend trillions curing the climate harm with Band-Aid fixes, and restoration and relief efforts. It doesn't matter that this fossil fuel infrastructure will be less damaging, less toxic, lower emitting.

We have other options even for an energy-intensive economy: the solar and wind capacity is logarithmically approaching demand. To fulfill an immoral, unnecessary need with the most efficient method doesn't make it moral or necessary. To choose to kill someone with a slow drip of drugs instead of a burning at the stake shouldn't be tolerable.

And the few jobs this project will bring? What about the fastest growing job sector: renewable energy? Do jobs and profits from producing clean energy to distribute or convert not compare with the glory of industrial plastics or fuels sustaining a pollution indulgence?

Our liver is giving out but as it goes it's taking the kidney, the heart, and the lungs down with it. From an economic standpoint we need to reject anything remotely long term that only has viability in the short term. From a land rights standpoint we must reject a project that further degrades the land, dismisses the traditional custodians' council and appeals, and pollutes the industrialized section that through affordability subjects the most vulnerable to the greatest risks from emissions. From a global justice standpoint we must reject a project that accepts a climate regime where the greatest polluters are allowed to pollute (even if it's to a lesser degree) for their "economic stability" and "growth" while the least emitting are forced to bear the most unbearable of the consequences. From a human standpoint we must reject the utter surrender to the ails of dependency. We have the will and the power to get clean, we can quit, we might need help, but this addiction WILL be overcome one day.

Comments on proposed Methanol Plant near Kalama, WA: 9-21-2020

Local opposition to this project is very strong, and for the State Department of Ecology to even consider building a facility of this scale, with the massive amount of pollution (4.6 Million Tons per year) that would be released in a heavily populated area like ours, would be to act without consideration for the people that live in this State, and near this plant.

If this project is completed, property values in the area are sure to drop, the locals will lose money as NWIW rakes it in, and then sends a chunk of it to China. Health problems would increase from aforesaid 4.6 Million Tons of pollutants being dumped into the air, and the effect of removing large amounts of water from the Columbia for the plant's use on the local fisheries is unknown.

NWIW claims a "net benefit to the environment", which would only be true if the exact terms of their vision of the future comes to pass, and only from a global perspective. The Washington State Ecology Board needs to consider the local effect as the deciding factor, not the global effect.

The only way that the local environment will benefit is if this plant is not built at all. The net benefit language is based on global standards, not local, and again, there is no benefit to increased pollution of our local air. I live just 13 miles from the planned plant site, and if this monstrosity is allowed, I will be considering selling my property, and moving as far as possible away from it.

As a property owner in Cowlitz County, and a citizen concerned about his health, I strongly request that you do not allow a permit for this plant to be issued.

James Tejcka

3669 Old Lewis River Road

Woodland, WA 98674

Sue Rutherford

Good day and thank you for this opportunity to say: Deny the permit for the proposed Kalama Methanol Plant, Kalama, Washington

First of all, the method for production is a huge project unto itself. Building a natural gas pipeline for the Methanol plant. This would part would require huge amounts of natural gas to be garnered and maintained to the manufacturing of the methanol. The plant would use up to as much as 1/3, one third of all the natural gas being used in the State of Washington, as of today.

Next is the impact on the Columbia River. I have lived in Cowlitz County for almost 50 years and it has taken almost that long to bring the Mighty Columbia back to a pristine level. The pollution was abhorrent and disastrous to the fishing industry. If this plant is built, there are two major factors that could deliver a severe environmental impact: 1) Many containers that would travel on the Columbia River and the Pacific Ocean. Any amount of methanol would have serious effects on aquatic life. It only take .5% methanol to hinder digestion. Methanol will be broken down into water and CO₂ (USMEOH)- gee, more to add to the climate change disaster, occurring before us. 2) If the carbon dioxide emissions are not reduced, the impact of global warming will expedite the melting of glaciers in Greenland and Antarctica, raising global sea levels by 15" by 2100 if the world keeps producing greenhouse gases at or near its current pace - Cryosphere(ISMIP6)

Finally, the air we breath. The area to be considered sits in a bowl, where air stagnates during the worst of the winter season. The entire West Coast just went through weeks of hazardous air, where the conditions of global warming/climate change, exacerbated the dry forest and a high pressure system of heat. It makes absolutely no sense, to add to the problem of global warming/climate by adding to the amount of CO₂. The argument of we won't be adding as much as some other method is ludicrous. To avoid paying Peter (the future), this methanol plant is going to cheat Paul (the present).

The air, the water, and the earth are counting on us to be better stewards. We don't want to be at the point where we say' "I wish we would haven't done that". Please please deny the permit for the building of the Kalama Methanol plant, in Kalama, Washington.

Don Roberts

Based upon the findings of the draft second supplemental EIS, any plans to permit this methanol plant are extremely shortsighted and pose a significant threat to our environment and the planet. As a WA licensed professional mechanical engineer, I agree with the EIS report indicating negative effects of the plant. Washington should refocus its efforts on clean alternative energy and not enable dirty energy to continue as business as usual. Clearly, China could burn the methanol rather than produce plastics as Governor Inslee suggested. Please do not permit this falsely promoted scheme.

Andrea Burke

Hello, I am Andrea Burke, an educator in Portland, Oregon:

I have taught my students to live simply and naturally. To protect the earth and support nontoxic projects. I oppose the Kalama Methanol Refinery and encourage my students to oppose it, too, for future life in our region and on the planet.

It is our serious responsibility now to outright reject any new fossil fuel infrastructure and we must deny the Kalama Methanol Refinery. Instead we must look to create jobs and careers within sustainable industries.

The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an outright nonsensical evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not.

We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution, and use more fracked gas than all of Washington's gas-fired power plants combined.

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's protect future generations by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Thank you,

Andrea Burke
andreasueburke@gmail.com
Portland, Oregon 97219

Philip Scott

I am hereby testifying against the Kalama Methanol Refinery. This proposed refinery will have a devastating impact on the environment both upstream, downstream and through localized emissions.

We already face an existential threat to the planet associated with greenhouse emissions. While one can argue in favor of jobs and a better manufacturing design which will reduce emissions versus a similar operation overseas, and natural gas being a cleaner fuel, this is a short term perspective which doesn't address overall climate change. As your analysis indicated, methane and other greenhouse gases will rise significantly even with the improvements and mitigation efforts associated with this project. Furthermore, this project is not consistent with the State of Washington's initiatives regarding climate change.

We are at a climate tipping point. Global temperatures have already risen 1 degree centigrade and 2 degrees centigrade is likely to result in irreversible devastation of our environment, leading to the end of life throughout the world as we presently know it. Wildfires, drought, historic high temperatures, extreme storms and hurricanes will only intensify in size and scope short of drastic reductions in greenhouse emissions.

The only acceptable answer to this existential threat is to stop building any and all significant generators of carbon emissions, together with phasing out all existing coal and natural gas facilities. Any new developments must only focus on new clean energy facilities.

The future of mankind, including your children and your children's children beseech you to reject this project outright.

Anonymous Anonymous

There is no guarantee or even any likelihood that NWIW would "mitigate" its greenhouse gas emissions over a sustained period. Plus we have NO idea what kind of mitigation measures they are talking about. Since we don't have any way to remove CO2 from our atmosphere other than plant material, are they planning on planting trees? And when someone plants a small sapling, it is NOT capturing much CO2 for generations. You can't plant a field of saplings and say you are offsetting much CO2, but that's what companies do. Plus, with climate change, that tree is as likely to burn in a wildfire and release its CO2 anyway.

This project would emit massive amounts of methane from the fracking well, through transport, and I don't even know what would happen after it leaves Washington. There is no way to mitigate methane. Any talk of mitigation should be completely disregarded for this dangerous project.

We need ALL resources dedicated to removing greenhouse gases currently existing in the atmosphere, and you have the power to STOP THIS POTENTIAL release of inconceivable amounts of additional greenhouses gases. I BEG YOU TO DO THE RIGHT THING AND DENY THIS PROJECT'S PERMITS!

barrett gifford

My name is Barrett Gifford. I live in Southern

Oregon. I am writing to voice my thoughts on the Kalama Refinery, while also being evacuated from my home due to wildfires. These wildfires are a direct result of climate change, rising temperatures and drought all along the west coast. Please consider the science!

It is our serious responsibility now to outright reject any new fossil fuel infrastructure and we must deny the Kalama Methanol Refinery. Instead we must look to create jobs and careers within sustainable industries.

The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an outright nonsensical evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not.

We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution, and use more fracked gas than all of Washington's gas-fired power plants combined.

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's be bold, and redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Lakshin Kumar

It is absolutely essential that permits for this facility are not passed as it would represent a drastic step in the wrong direction for the fight against climate change. The Department of Ecology has shown that the construction of this facility will likely increase global amounts of Greenhouse Gases, harming the Earth by trapping heat, destroying ozone, and polluting the breathable air. This facility is slated to create 4.6 million tons of climate pollution per year for forty years which is unacceptable at this point in the fight against climate change. In addition, the methanol that is refined at this plant will likely be used to manufacture plastics, increasing the already abysmally high count of plastics that will eventually find their way into dump sites around the world and poison the Earth. It is paramount for the health of life on Earth that we take a stand against climate change, starting with the rejection of this plant's construction.

Hilary Gaddis

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

I am called to act out my values – I'm a member of Fauntleroy United Church of Christ and also a local Washingtonian for the past 30 years or so. My upbringing was centered around protecting our natural resources, fostering an understanding of stewardship. It's becoming clearer every year that more and more of our environment is at risk of being lost forever.

Yet I continue to remain hopeful and was proud of our state for declaring their commitment to clean energy and climate goals. I believe that clean energy for all is the path forward and the only way to move if we want to protect all we hold dear.. such as our human right to clean water and healthy air.

However I am concerned about this proposed menthol plant and wholeheartedly believe it goes against the values I have shared with you tonight – it frightens me that we are cowing to the pressures of the fossil fuel industry – I know in my heart that we can reject the path they have set out , a path that does not align with my values of clean water and healthy air.

So in conclusion I am firmly rejecting this proposal and need YOU Dept of Ecology to deny the Shoreline Permit in order to preserve a **HEALTHY – SUSTAINABLE – THRIVING – FUTURE – WITH – CLEAN ENERGY !!**

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,

Hilary Gaddis

Jennifer Ibach

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. If this summer has shown anything, it's that we need to take urgent action to reverse the effects of climate change. I do not want to see any more pollutants added to the air!

Gary Brill

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Karen Varney

Jane Heisler

Washington Department of Ecology

RE: Kalama Methanol Refinery

The State of Washington has made many positive accomplishments toward pursuing a lower carbon future. This year, Governor Inslee signed new zero emissions vehicle standards, mirroring California's high standards. Last year, the Legislature adopted standards to increase efficiency of office buildings and other workplaces. In 2019, the governor signed the Clean Energy Transportation act to require all electric utilities to transition to carbon neutral electricity by 2030, and 100 percent carbon free electricity by 2045.

In light of these positive actions, it is shocking that the State of Washington would consider approving a polluting, climate disaster like the Kalama methanol refinery, making a mockery of your other good efforts. This refinery would be inconsistent with the low-carbon future that Washington aspires to and that the region needs. I live in the Portland/Vancouver area and do not want this in my backyard. I care about the quality of life in our area, including air, water and land quality.

The idea that methanol displaces "dirtier" energy is speculative at best. Burning methanol as fuel would generate millions of tons of pollution each year. Do not allow this major source of pollution to move forward. Deny the Kalama methanol refinery.

Sincerely,

Jane Heisler

Tod Johnston

Vikesh Kapoor

Washington Dept. of Ecology Sept. 22, 2020
Attn.: Rich Doenges
PO Box 47775
Olympia, WA 98504-47775

Hi, I'm Vikesh Kapoor, I live in Topanga, CA.

Right here and all over the globe, fires rage. Glaciers and polar ice steadily melt at alarming rates. Climate change is happening now. We are in a crucial time regarding the survival of humankind and life as we know it.

It is our serious responsibility now to outright reject any new fossil fuel infrastructure and we must deny the Kalama Methanol Refinery. Instead we must look to create jobs and careers within sustainable industries.

The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an outright nonsensical evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not.

We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution, and use more fracked gas than all of Washington's gas-fired power plants combined.

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's be bold, and redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Thank you,
Vikesh

Earl Godfrey

I have spent days paddling through the Columbia river on canoe. I have slept nights on its banks. I do not want to see a natural system I love so dearly be polluted and corrupted by the manufacturing of plastic. Please think of the environment.

Laurie Schaetzel-Hill

RE: Kalama Manufacturing and Marine Export Facility-EIS. I wish to state that i do not support advancing with this facility. The environmental consequences could be detrimental and the mitigation suggestions are not adequate. During this era of climate change causing drastic weather pattern changes (hurricanes, fires, floods, drought) we need to focus on reducing and not increasing carbon and methane release into the atmosphere.

Linda Magnuson

Methanol is a potent greenhouse gas. We are in the midst of a climate crisis and extreme drought in Washington as well as Oregon, where I live. Hazardous air quality due to the smoke of numerous, monstrous wildfires, have weighed on us. These fires were driven by a combination of dryness of the forests, unsuccessful forest management practices that left lots of kindling and high wind conditions. The drought is effected by increase in greenhouse gases from the use of fossil fuels. This plant is not a good fit with what is going on in the world right now. From a personal level, I wants viable future for my family and for all people and other species with whom we share this planet. Consider the future and the health of our planet.

Kiah Patzkowsky

I oppose this production plant due to the increase of greenhouse gas emissions into the region.

My name is Mark Uhart and I'm a Kalama area resident. We believe Ecology will hold true to their mission and deny the shoreline permit.

Over the last two online comment sessions I've listened to both sides. I understand the need for jobs and how this project will improve the lives of the working class in Cowlitz County for the first few years of the project. But the high-paying jobs will not likely come from current Cowlitz County residents. The skills needed to run this plant will require mechanical and chemical engineers that will be recruited from out of state. Key inside jobs, like the CEO/Chairman, CFO, comptroller and COO, will be filled by foreign nationals, as proven by the three H1B visa applications submitted by Pan Pacific Energy. The only jobs that will go to local residents will be the hazardous blue collar and administration jobs. I've seen this play out in the Chinese-owned refineries in Texas and Louisiana.

It is true the project would provide additional local, county and state revenues from taxes and fees. But what are the long-term social and economic costs if the KMMEF and other fossil fuel projects are approved? We are at an environmental tipping point and a slower rate of pollution is not going to forestall global warming. The last time the earth warmed this quickly was 56 million years ago.

The US is still the most powerful country in the world, yet we are not taking responsibility for the mess we created, nor the future of mankind. We can either take the lead and say NO to these fossil fuel projects, as our Governor directed, or stand by and watch the earth heat to a point our grandchildren will be one of the last generations to survive. The United States is responsible for most of the GHGs emitted since industrialization in the US surpassed that of the UK in 1910. As of 2017 the US is responsible for 397Gt of CO₂, with China emissions at 214Gt and the former USSR countries at 180 Gt.

The United States is responsible for most of the GHGs emitted since industrialization in the US surpassed that of the UK in 1910. This is illustrated in one of the many CO₂-tracking portals, such as the US Energy Information Administration ([USEIA](#)) and non-profits like CarbonBrief, which issues [the status of the climate each year](#). As of 2017 the US is responsible for 397Gt of CO₂, with China emissions at 214Gt and the former USSR countries at 180 Gt.

The IPCC projects global energy-related CO₂ emissions will grow 0.6% per year from 2018 to 2050 assuming global GDP remains around 2%. However, future growth in energy-related CO₂ emissions is not evenly distributed across the world: relatively developed economies collectively have no emissions growth, so all of the future growth in energy-related CO₂ emissions is among the group of countries outside the Organization for Economic Cooperation and Development (OECD), of which China is not a member.

There is no assurance China will retire a coal-fired methanol production plant if the KMMEF is built. On the contrary, energy sector economics and their plan for economic and social development indicate they may even build more coal-fired plants. China's [14th five-year plan \(FYP\)](#), setting out its national goals for 2021-2025, will provide more insight as to the use of coal for energy. [China's National Energy Administration](#) released a risk warning notice No. 12 on coal power planning and construction in 2023. In this document the provinces were notified that they may construct additional coal power plants under certain risk conditions. This contradicts NWIWs replacement theory.

I realize the fact that the KMMEF will be owned and operated by a foreign entity is not a legal restriction under Washington State code. However, the risks associated with Chinese ownership, governance, transparency in environmental protections, and public safety oversight should be a concern.

I certainly hope Ecology will read all the written comments, and scrutinize the information in this SSEIS. I read the SSEIS and there are so many bad assumptions, omissions of relevant information, poor application of technical information, and a covert attempt to under report upstream, operational and downstream emissions. I documented my review and I am submitting multiple comments, referencing all my sources.

This project:

- Underreports GHGs because it doesn't mitigate upstream and downstream GHGs outside of Washington.
- It continues to refer to information in the FSEIS, such as the 100-year global warming potential, instead of the 20-year GWP for fugitive methane.
- It refers back to GREET_2017 emissions data in some tables. The standard now is GREET_2019.
- It cherry picks information from fugitive methane research papers such as Yu Gan (2020), Alvarez (2017 and 2019), and others.
- It presumes the use of Ultra-low Emissions (ULE) technology that has not been approved by the EPA through application of a Prevention of Significant Deterioration (PSD) Permit for GHG emissions. This technology was first used in 1994 in an Australian power plant.
- NWIW reports ULE will emit 38% less GHGs than CR Technology, but I found several articles that indicate the savings is only around 31%. The actual emissions from ULE are unknown.
- The GHG emissions reported in Section 3 are based on "net GHG emissions." The emissions this plant will be responsible for include all upstream, operations, and downstream GHGs to include at least 60% of the methanol used as a fuel.

- The Voluntary Mitigation Framework (VFM) presented is inadequate and unenforceable. The VMF Board of Directors doesn't include stakeholders from local Kalama residents, environmental non-profits like the Columbia Riverkeeper and Sierra Club, and Native American tribes. Only a legally enforceable MOU/MOA, signed by all stakeholder representatives, is acceptable.

Thank you for giving us the opportunity to weigh in on this project. Your efforts are appreciated.

Mark Uhart
LTC, USA Ret.
Kalama, WA

Lezlie Popik

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Alan Smith

"The Kalama methanol company's cheerleaders are touting benefits that are only relative to a nightmarish reference point: that states and nations fail to live up to their climate agreements. They assume failure of the Paris Climate Accords, failure of China to approach fulfilling its pledge to be carbon neutral by 2060, and, along with it, unchecked growth of fossil fuels for transportation and cheap plastic. Then, relative to that catastrophic failure, they selectively point to a portion of the recently-released Second Supplementary Environmental Impact Statement, which uses dubious logic to show that the Kalama methanol would make things slightly better. It is the moral equivalent of urging someone to jump off a slightly shorter skyscraper."

This project should not be approved! As China's leader has said, we cannot continue to ignore the warning signs from nature. We must transition from fossil fuels (and feed stocks) to clean and sustainable resources.

Ron Sikes

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Caroline Cates

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

River Montijo

The foto says it all!

A woman with short grey hair, wearing a red hat decorated with yellow and orange flowers, red-rimmed glasses, and a red and white floral vest over a pink and white checkered shirt, stands in front of a tall green hedge. She is holding a large white sign with black and red text. The background shows trees and foliage.

Denise Busch

Urging your to not approve the Kalama Project. Protect the future of the environment.

Laura Feldman

I was born and raised in Portland, OR. I'm 66 years old, and each decade brings challenges of cleaning up our toxic, chemical, and radioactive wastes while stopping the sources of this pollution. I consider this to be the most important work now and for many generations to come. Anything else, like building this methanol refinery is simply an attack on all life trying to navigate ongoing climate disruption. And, it will be seen as such further down the road (if there is more road) by our communities which we either failed or tried to protect.

The fossil fuel industry is over. Most of us know this. Please, don't support NWIW in destroying this region. We are counting on you.

Sincerely,

Laura Feldman

Jeanne Poirier

NWIW advertises good jobs, boon to economy and reversal of carbon footprint by allowing this project. I trust you are smarter than this boondoggle. It is time to implement projects which support a livable future not lock us into decades of water waste and amazing pollution by using fossil fuels to make more fossil fuels. I've always been against this project and ask you deny it to move forward SO WE CAN!

Jennifer Vinnard

Trusting NWIW is like grabbing an electric fence and hoping you don't get shocked,..you know it's turned on, it's going to hurt, but you still grab it anyways because you want to believe that everything will be okay, despite knowing the most likely scenario is a powerful jolt. The draft SSEIS is still using data provided by NWIW, not independent sources like it's supposed to. The speculations are astonishing..the biggest being that this methanol plant would displace coal to methanol plants, when not one ounce of proof backs such a claim. Zero, not one single refinery in the entire world has indicated that they'll reduce or halt production if this plant is built, and with China's ever increasing methanol demands, dropping values and competitive prices will cause the inflated projected profits to plummet! More and more people are changing their support for this project, lack of trust in China, the truth about how many truly local residents might be able to work there, the amount of pollution it'll produce..which the EIS still underestimates, neglecting to include pipeline emissions, shipping emissions, being used for fuel, etc.. the only people supporting this are those who are being paid to promote it, those who still believe they might work there, and the few who stand to profit from it, most of whom don't live anywhere near the intended build site.

What has happened to people caring about the truth? The cons associated with this refinery are staggering, the risks far outweigh any amount of profit, at a projected \$40 million/yr, it's nothing compared to the \$395.5 million our state received in cannabis tax revenues just last year, which has grown each year..this refinery won't grow in profits, it'll drop due to competition and fluctuations in natural gas prices. Current natural gas users will see costs increase, the already strained pipeline cannot handle the demand of the refinery, current customers, and will hurt future construction because the facility will use all the gas available. The 2nd pipeline they'll need to build will face severe opposition as well, what happens when they can't get it approved?

Building atop dredged river landfill, the threat of liquifaction during an earthquake is enormous. The risks of the lateral pipeline, built on landslide prone hills and being ran under the I-5 freeway and train tracks leaves it vulnerable to accident caused ruptures..that is our only freeway from Portland to Seattle, if shut down for repairs, our transit system's would be completely halted. 4.6 million metric tons of ghg emissions PER YEAR, a lowballed amount, is not in line with our state and global emission goals, the negatives go on and on!

My family moved to Kalama for the beautiful mountain and river scenery, not for a gigantic smokestack billowing pollution over our land, into our waterways, into our lungs...we are begging Dept of Ecology to deny the permit and fight to keep Washington the wonderful state we've lived in our entire lives. Please don't sell out our health and our values for China's benefit, it's just not worth it! Thank you, Sincerely, The Vinnard family

Gloria Uhart

My name is Gloria Uhart and I live near Kalama.

I'm not an avid researcher like my husband, but I know a rotten fish when I smell one. And some information provided in the SSEIS stinks. The lack of discussion about the culture of the indigenous people of Washington tells me NWIW is not interested in telling us the truth. The truth is that our salmon, steelhead and shellfish fisheries are in rapid decline and this GHG bomb will accelerate their demise. These GHGs will increase ocean acidification, increase water temperatures in the Columbia River and Pacific Ocean, and reduce the amount of dissolved oxygen in the water. These effects will lead to the destruction of the fisheries Native American's depend on to survive, economically and culturally. I am 36% Native American and I want to be heard.

The Marine Spatial Plan for Washington's Pacific Coast, published Oct 2017 and revised June 2018, was jointly authored by the Washington Departments of Ecology, Natural Resources and Fish & Wildlife. As described in the "Marine Spatial Plan," "the management of the marine environment is crucial to each of the coastal tribes, as the marine environment is integral to their history, culture, identity, and future. The MSP Study Area overlaps with 67% of the combined, adjudicated tribal fishing 'Usual and Accustomed' areas (U&As.) Five federally-recognized tribes (the Hoh, Makah, Quileute, Shoalwater Bay Tribes, and Quinault Indian Nation) border the MSP study area, with the study area's southern boundary at the mouth of the Columbia River."

This area overlaps with the "action area" defined in the Marine National Fisheries Service biological opinion dated Oct 2017, and includes some of the "Usual and Accustomed Areas" fished by federally-recognized tribes along Washington's West Coast. The NMFS biological opinion stated that the "action area" is part of the critical habitat for these Washington fisheries. As such, they were included in the assessment of the methanol plant's direct and indirect impact on 24 ESA-listed endangered and threatened species.

The biological opinion asks the question for each of the 24 species, "Is the action likely to adversely affect this species or its critical habitat?" The answer was YES for 12 threatened species and YES for 7 endangered species. So, why wasn't this disclosed in any of the EISs? Why wasn't there an attempt to quantify the potential impact to our fisheries? Why weren't all the affected tribes invited to participate in the scoping of the EIS?

That's why I am asking Ecology to deny the shoreline permit. Our indigenous peoples' treaty rights must be respected.

Thank you for allowing us to be heard.

Kathleen Boylan

My name is Kathleen Boylan. I am a 70 year old retired RN with respiratory problems. I am fortunate enough to own a house in SE Portland with filtered air conditioning.

Unlike thousands of my fellow Oregonians I was able to stay home during the smoke filled week of the worst air pollution in the world

We are experiencing the effects of climate change NOW. We must not add the millions of tons of green house gas pollution Into the atmosphere that this refinery would spew.

Please deny this project which will only serve to exacerbate our existing health crises.

Kimberly Seater

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Josh Furlong

Please do consider the health and well being of the children in our state. I own 5 properties in cowlitz county which are rented to 6 seperate families, one property being multifamily. My wife and I feel it would be inviting an environmental hazard into our back yard. The country backing the development and receiving the goods has been reckless in their environmental impact on our global environment for decades. Their intent shared thus far to local stakeholders have been deceptive. We would appreciate the state we pay taxes to and depend on to keep our rights protected to think very critically about the air quality we depend on while raising our children in. If you look at the fires as of lately and consider the trend winds of the Columbia it was evident being between to busy urban areas it is not satisfactory for clearing pollution.

Please do not allow this plant to be permitted to develop in Kalama, Wa, under the current scale for which it has applied for and the dangerous activity it would encourage by way of fracking that has decimated the beautiful Dakota and Big Sky planes. We urge you to take this decision into critical consideration for the future of our youth and environmental well being.

Respectfully,

Josh Furlong

Jessica Adams

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Nick's emissions analysis shows that this is a good deal because this project emits fewer outrageous numbers of tons of GHG emissions when compared to even more outrageous coal sources. To get there you have to assume the doomsday scenario that for the next 40 years there will be no global action to address climate change. On top of that if any of the following the assumptions are true then this big idea that applicant's plant will displace a coal methanol plant from being built, fails. You have to buy into applicant's claim that:

1. For the next 40 years there will be endless growth in demand for fossil fuel based plastics or methanol or other fossil fuels.
2. And for the next 40 years we can with certainty predict Chinese manufacturing, trade and environmental policy, tech development and global commodity markets.
3. And for the next 40 years no coal based competitors will produce methanol because they'll see the Kalama plant in operation and fold their tents knowing methanol consumption will be a fixed amount.

It's so divisive to this community for Ecology to promote this project as one that reduces greenhouse gas emissions.

The fact is the low cost methanol that applicant sells to the into global market will affect demand, will affect price and will affect supply. Actually it's gonna incentivize other methanol plant production. It won't at all displace coal but instead will displace Renewable Energy Sources!

And you're lowballing the amount of methane that will be released. The "bottom up" method of measuring methane relies wholly upon the gas industry granting permission to measure

where they want us to measure. ZERO independent verification. And we're talking 40 years of this production to distribution gas highway. Blow outs will occur, they're inevitable. Just one gas well in Belmont, Ohio blew out in 2018 and spewed more methane into the air in 20 days than most of Europe did in an entire year. Bottom up measuring, completely dependent upon the gas industry's permission to measure where it wants us to measure, is the opposite of random testing. Couple that with inevitable catastrophic discharges and you have a rock solid basis for denying this permit on the basis of untenably large greenhouse gas emissions.

Ecology's job is not to provide jobs and not to weigh the merits of plastic, its stated mission is to protect the environment for future generations.

.

Jean Avery

Today (9/23) in the news, China's President Xi announced a target of carbon neutrality by the year 2060. Speaking to the United Nations, he referred to "green development."

According to the Financial Times, "this could push coal demand in China close to zero."

This shift significantly alters the primary assumptions regarding the need and/or justification for methanol from Kalama. Certainly, we can no longer assume the demand as projected in the SSEIS.

This project is too risky. The future is uncertain. I urge the Department of Ecology to deny the permits for this project.

Mark Uhart

My name is Mark Uhart and I live near Kalama. Many of my neighbors are fisherman but not many fish are being caught these days.

In my quest to bring facts to the table, I read many peer-reviewed research papers on the aquatic biodiversity of our oceans and the effects of climate change on our fisheries. This includes the Pacific Ocean all the way to the coast of Alaska and the Bering Sea where salmon spend a good part of their life. Washington fisheries are not the only ones in decline. This year salmon returns in Alaska are so poor that many Alaskan communities are claiming fishery economic disasters and requesting government assistance. As of August 12th all sockeye, chinook, pink and chum salmon fisheries were below projections, with some areas completely closed to commercial fishing.

I reviewed the 2019 and 2020 Washington Coho Forecast Summary published by the Dept. of Fish and Wildlife. The forecasted and actual returns for hatchery and natural Coho salmon went from a little over two million (2,013,316) in 2019 to just under 1 million forecasted (987,494) in 2020, less than half. Runs will likely be just above 50% of the 10-year average. Every production unit is forecasting significantly fewer natural fish. Although this is a snapshot, and only represents one of the 19 species, the running 10-year average indicates nearly all species of salmon and steelhead are in decline. Many species will be on the edge of extinction by 2050 as a result of climate change, and here we are still considering the approval of a shoreline permit that will speed up global warming. I'm in shock. What are we thinking?

And to think China is going to shut down coal-fired plants if this one comes online is wishful thinking. Do the research. This author discovered an open source document in mandarin and translated it to English. China's National Energy Administration released guidance to provincial governors for the construction of more coal power plants in 2023 (China National Energy Administration Bulletin No. 12, 2020.) It states, "In order to implement the requirements of the national coal power development policy for issuing and implementing coal power planning and construction risk warnings on an annual basis, strengthen the power and heat supply guarantee capabilities, and better guide local and power generation companies to approve and construct self-use coal power projects in the province in an orderly manner..." In order to achieve the goals set in their 14th 5-year plan, for 2021-2025, they will be building more natural gas refineries and coal power plants. So much for NWIW's assumptions.

I hope Ecology sees the SEIS for what it is. It is a scheme that underreports GHGs, avoids mitigation, and sells local jobs now for a climate emergency in the future that cannot be avoided anyway. Therefore, NWIW purports it an acceptable outcome. If this plant is approved, the Port of Kalama will be the ring in the bull's nose, waiting to be pulled at China's discretion.

I urge Ecology to deny the shoreline permit.

David Purkerson

I would like to add my voice to those who are speaking out to oppose the siting of a methanol plant ANYWHERE in the Pacific Northwest. This is contrary to our NW values and will compromise the environment my family has lived in and respected since 1859. There is no amount of money that would change my mind. Nobody that loves the Pacific Northwest would even consider this. Please do not build a methanol plant in Washington state or anywhere in the Pacific Northwest. Sincerely,
D. N. Purkerson

Lynn Stiglich

The fact of climate change is undeniable. The signs are everywhere, and have been for years.

The fossil fuel industry has been deceitful in its knowledge of climate change due to their products. The industry continues to distort facts, citing statistics that are suspect and misleading.

The Kalamazoo methanol refinery project is a case in point. It is unconscionable to proceed with this project, in light of the pollution it will generate and the potential for an accident.

Please deny permits, reject the proposal and instead focus on projects that put Washington at the forefront of the clean energy movement. There are jobs and opportunities in pursuing clean energy, as well as the importance of curbing emissions.

Please reject the Kalamazoo refinery project.

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. The evidence in this draft SEIS demonstrates that Washington should deny NWIWs proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Bill Adams

Please reject the proposed methanol refinery in Kalama. It would be an environmental disaster should it happen. Why? It would use up to 130 million cubic feet of mostly fracked gas daily, more than all other gas users in our state combined. Fracking is anything but a clean process. It uses known toxic chemicals to clean and lubricate the drilling pipes. It has contaminated ground water with these chemicals. Some of the waste water reclaimed from the fracking process can be reclaimed and reused but only for more fracking. It's still so dirty it cannot be used for growing food or for human and animal consumption. Just more fracking. It has even been known to have caused earthquakes in areas that have experienced few, if any, earthquakes. But, most significantly, it has been fully documented that fracking is a source of methane leakage. Methane leaked into the upper atmosphere is 30 times more of a heat blanket than CO₂ measured over a 20 year period. More fracking to support this proposed refinery's voracious appetite for so-called natural gas will simply mean more methane leakage as well as the other drawbacks already mentioned. As such, this project is not in our state's best interest nor the entire planet's for that matter. Please reject it. Thank you, Bill Adams

Susan Williard

Washington Dept. of Ecology
Attn.: Rich Doenges
PO Box 47775
Olympia, WA 98504-47775

September 23, 2020

Dear Mr. Doenges,

All over the globe, fires rage. Glaciers and polar ice steadily melt at alarming rates. Climate change is happening now. We are in a crucial time regarding the survival of humankind and life as we know it.

It is our responsibility now to reject any new fossil fuel infrastructure. We must deny the Kalama Methanol Refinery. Instead we must look to create jobs and careers within sustainable industries. The 'Without Kalama' case in this SEIS is a strawman argument. Saying this methanol refinery will create an emissions 'reduction' compared to if, theoretically, the plant were built using other technologies and locations, is a fallacy and an evasion of the climate crisis at hand. It is blatant greenwashing by The Chinese government corporation, Northwest Innovation Works. Insisting it has to be and will be built, whether here or somewhere else, is wrong. It does not, and it must not. We must not allow a refinery that would cause more methanol to be burned as fuel overseas and result in significant methane pollution from fracking.

We must not allow this methanol refinery which would quickly become one of Washington's most significant sources of climate-changing pollution and use more fracked gas than all of Washington's gas-fired power plants combined.

Any mitigation for environmental impacts and emissions would at best be a tiny bandaid on a gaping wound.

Economic impacts for the next 40 years stated in this study fail to attempt to look at economic impacts of climate change and climate disasters over the coming decades.

Let's be bold, and redefine our generation by making decisive and final rejection of this new fossil fuel development. This, in hope for the future of us, our kids, grandkids and all future generations. I appeal to you, please reject the Kalama Methanol Refinery. It shouldn't be built here or anywhere, and we must do our part to stop it.

Thank you for your attention to this important matter.

Kind regards –

Sue Williard
San Francisco, CA 94122

Mary Gallagher

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Sam Rich

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Don Steinke

The market forecasts used in considering likely scenarios in the draft SEIS were inconsistent with China's pledge to peak emissions by 2030 and then scale down. But on Sept 22, 2020, China promised to be carbon neutral before 2060.

Your market projections for new demand for methanol could be inconsistent with either China's commitment to scale down or its new commitment to be net zero before 2060.

Please address that in your final SEIS.

Electronic Submission to the Department of Ecology, State of Washington

September 24, 2020

Subject: Review Comments and Recommendations on the Draft SEIS for Permits/Approval of Northwest Innovation Works Proposed Kalama Gas to Methanol Refinery

Summary: As the Final EIS and Decision Documents are prepared for this project, I call on the Washington State, Department of Ecology to not approve the Shoreline Conditional Use Permit and to deny any proposed action associated with Proposed Methanol Refinery on the Columbia River in Kalama, Washington.

Response to Report's Summary Findings:

- **The project would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year.** The Kalama facility would be one of the 10 largest sources of greenhouse gas emissions in the state. Northwest Innovation Works has said that it will mitigate all of the facility's in-state emissions.

Response: Avoidance of adding over 1 million metric tons of CO₂ and other Greenhouse Gas (GHG) emissions to our Region will be the best action for all. The documents don't adequately address methanol leakage and impacts to the local area. Mitigation measures are susceptible to failure and inadequacy.

- **Worldwide demand for methanol is likely to increase in the decades ahead,** leading to higher greenhouse gas emissions with or without the Kalama facility

Response: We can all work together now to stop and reverse this trend before more serious impacts of Rapid Global Climate Change occur.

- **It would lead to methanol being burned as a fuel.** Northwest Innovation Works has said all of the methanol from the Kalama facility will be used in plastics production, but increasing methanol supply makes it more likely that more methanol will be used as fuel, regardless of the source.

Response: Burned as fuel, the Kalama project could add between 2 and 5 million tons of carbon pollution per year. Even China is reportedly beginning to take action to reduce pollution and GHG emissions!

- **Extracting and transporting the natural gas used to make the methanol could produce higher emissions than previous estimates.**

Response: This is a serious issue, throughout our Country, methanol pollution is increasing and has caused serious air quality including reduced poor visibility – The Methanol Haze.

- **Methanol made in Kalama could produce lower greenhouse gas emissions than many competing methanol supplies**, from coal or less efficient natural gas sources. This means that global greenhouse gas emissions would increase with the addition of the Kalama facility, but likely less than they might if that demand was met by other sources.

Response: Weak argument. See my comments herein. Let's work together and form a Green Business Center in Kalama!

Detailed Comments:

The original Environmental Impact Statement (EIS) as well as the supplemental documents (SEIS) are full of generalities, assumptions and unsupported statements. Reviewing Officials are urged to be open minded and listen to all commentors on this project. (Collectively, under law, I will refer to this as the EIS to incorporate the SEIS and SSEIS under this project, as a final decision document nears).

The air quality analysis is particularly weak and limited in its scope.

The Analysis is to address existing and estimates of project emissions and compare expected impacts against a variety of standards under various scenarios. The analysis fails to simply and adequately address the relationship of the project and the local area along with greater impacts to the regional area, and global climate change, in fact, rapid climate change should be addressed, as this proposed project is a likely component of such.

The Regional area around Kalama has just experienced over a week of unhealthy and hazardous air quality conditions. <https://www.columbian.com/news/2020/sep/15/clark-county-is-worst-in-state-as-washington-sets-record-for-hazardous-air/>

The document is incomplete in its analysis of emissions of CO2 and other GHG along with local air quality hazardous air events. Visual Quality impacts have also not been adequately addressed.

The EIS documents actually assumes that the air quality in the area will improve with future improvements in other standards, including an expectation that EPA will have new more stringent air quality standards for methanol, ships, etc. – when in fact, most recently, EPA has been relaxing standards. This is one, among a number of completely unsupported and likely inaccurate assumptions in the EIS and SEIS Documents.

Particularly disturbing is that there now appears to be little to no oversight of methanol pollution from existing and abandoned gas wells and fracking projects throughout the US. As a result, air quality conditions have deteriorated in many parts of the US, including the Southwest USA and California – where reports of methane air pollution, including a visual and visually degrading “methane haze” increase yearly. <https://www.bloomberg.com/news/features/2020-09->

[17/abandoned-gas-wells-are-left-to-spew-methane-for-eternity?utm_source=url_link&fbclid=IwAR2IZicvXTRm0jluzdnPfdE4m1iQ8b6ZXU4cArXgPekpclmnX9CNsHHEROM](https://www.cbsnews.com/news/who-are-the-biggest-us-methane-emitters/)

<https://www.cbsnews.com/news/who-are-the-biggest-us-methane-emitters/>

The air quality analysis in the documents, including this current SEIS, do not examine the air quality for special management areas nearby, including Mt Rainer NP, Columbia River Gorge NSA, Mt St Helens or the National Wildlife Refuges nearby including many islands in the Columbia River.

Many islands of the Julia Butler Hansen Refuge for the Columbia White-tailed Deer (JBH CWTD) and the Lewis and Clark National Wildlife Refuge have been designated as Wilderness Study Areas.

<https://www.fws.gov/pacific/planning/main/docs/WA/jbh-lc/Final%20CCP%20EIS/LAC%20JBH%20Final%20CCPEIS.pdf>

The US Fish and Wildlife Service has yet to complete these studies, however, some of the important criteria in analyzing Wilderness characteristics and values includes Air Quality. There is no or limited analysis of the potential impacts of the proposed plant's operation, nor the increased ship traffic and the associated impacts to air, fish, wildlife, including Threatened and Endangered Species and other natural resources of these important areas.

I contend that proceeding with the proposed action could likely impact the potential Wilderness Designation of Islands within the nearby Lewis and Clark and JBH CWTD Columbia River National Wildlife Refuges, and possibly the management purposes and objectives for these as well as other nearby Federal Lands. Analysis of the impacts of achieving and maintaining a Class 1 Air shed should have been addressed in the EIS documents from a variety of actions associated with the project proposal.

Burning Methanol or Making Plastics - - The project's purpose should be clearly explained.

However, whether it is to ship the refined natural gas to burn and directly contribute to air pollution and GHG emission or to make Plastics, neither purpose stands out to be more significant and important as helping to stop or slow down global climate change. In fact, the most significant positive action would be for the Kalama Community and Project Proponents to come together and denounce this project and work together as a community to develop Green Businesses. International networks of such communities are starting up and the growth potential seems unlimited, as well as a very positive future.

As for the future of plastics and it's recycling – I refer you to the following, which demonstrates the myth that all plastics are being recycled, when in fact it has never been greater than 10%,

and the future of recycling will need to rely on new innovations, but primarily and avoidance and use of sustainable and reusable products.

<https://www.npr.org/2020/03/31/822597631/plastic-wars-three-takeaways-from-the-fight-over-the-future-of-plastics>

Perhaps somewhere in Washington State there is a good place to help with recycling of plastics, if China is not going to take it from the US any longer. (I don't believe it is in Kalama). Or perhaps the US should ban the sale of methanol to China until they agree to a plastics recycling program.... However, with less than 10% of the volume of plastics generated worldwide being recycled, the future of plastic use for many products is unsustainable and unacceptable – the best alternative is to reduce plastic use and in our environment. Reuse, Recycle, Invent New!

Burning Methanol from the Kalama project as a fuel would generate millions of tons of particulate pollution yearly. Simply, these types of projects can't continue worldwide, without more serious complications associated with global climate change.

It is hard to imagine that the people of the Kalama area would want to have such a facility in their community. Or to have such a facility that causes so much environmental harm, on a global scale as well as the impacts to the local area – Columbia River natural resources, scenic beauty, fish and wildlife, public recreation, small town charm, etc.

Not only is this project proposed in the wrong location for a facility like this, we all must question whether or not just a facility should be built anywhere in the Western USA – or anywhere on Planet Earth!

I suggest that all of us, including the people of Kalama and the Project Proponents - must avoid taking the road of Short Term Economic Gain for the benefit of a small group of wealthy individuals when it seems clear that a road of Long Term Economic Stability and Sustainability with the Positive Benefits for the Public Good – including public health - - for Long Term sustainability – including clean air, water and healthy natural resources, is a better choice. We need to examine more clearly for all to understand what projects are healthy for our communities that will provide long term positive benefits for everyone, not just a few. And when necessary, as is the case herein, what are the long-term impacts for everyone.

From the Intergovernmental Panel on Climate Change (IPCC) Report:

Climate change has been intensively studied and acknowledged at the global, national, and regional scales. Climate change is being fueled by the human-caused release of greenhouse gas emissions, in particular carbon dioxide and methane. The Intergovernmental Panel on Climate Change ("IPCC") is a Nobel Prize-winning scientific body within the United Nations that reviews and assesses the most recent scientific, technical, and socio-economic information relevant to

our understanding of climate change. In a recent report to policymakers the IPCC provided a summary of our understanding of human-caused climate change. Among other things, the IPCC summarized:

- Human influence on the climate system is clear, and recent anthropogenic emissions of greenhouse gases are the highest in history. Recent climate changes have had widespread impacts on human and natural systems.
- Warming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia. The atmosphere and ocean have warmed, the amounts of snow and ice have diminished, and sea level has risen.
- Anthropogenic greenhouse gas emissions have increased since the pre-industrial era, driven largely by economic and population growth, and are now higher than ever. This has led to atmospheric concentrations of carbon dioxide, methane, and nitrous oxide that are unprecedented in at least the last 800,000 years. Their effects, together with those of other anthropogenic drivers, have been detected throughout the climate system and are extremely likely to have been the dominant cause of the observed warming since the mid-20th century.
- In recent decades, changes in climate have caused impacts on natural and human systems on all continents and across the oceans. Impacts are due to observed climate change, irrespective of its cause, indicating the sensitivity of natural and human systems to changing climate.
- Continued emission of greenhouse gases will cause further warming and long-lasting changes in all components of the climate system, increasing the likelihood of severe, pervasive, and irreversible impacts for people and ecosystems. Limiting climate change would require substantial and sustained reductions in greenhouse gas emissions which, together with adaptation, can limit climate change risks.
- Surface temperature is projected to rise over the 21st century under all assessed emission scenarios. It is very likely that heat waves will occur more often and last longer, and that extreme precipitation events will become more intense and frequent in many regions. The ocean will continue to warm and acidify, and global mean sea level will continue to rise. Carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride are recognized as the key greenhouse gases contributing to climate change. (IPCC AR5, Summary for Policymakers (March 2014))

In short, this project will add to and exacerbate the already declining quality of human health and impact the natural environment. Nationally, and globally, we all need to aggressively work to slow GHG emissions and attempt to slow and reverse the negative trends of rapid climate change. We must act locally, everywhere, to effect this change.

Closing

In closing, as the Washington State Department of Ecology completes the Final documents and reaches its Decision, based on my review of the project proposal and EIS documents, I urge rejection of the Shoreline Conditional Use Permit and non-approval of the Kalama Methanol Refinery. I encourage the businesses, Port and local government and citizens of Kalama and the

surrounding Region, and the proponents of this project to aggressively work together for climate solutions, discover local projects that will add to the beauty and charm of the community, the Columbia River Watershed, the State of Washington and the PNW. Focus on the quality environments that exist and work to help and improve water quality, air quality and the natural resources which support the great Columbia River fishery, wildlife and wilderness characteristic of the nearby and surrounding State and Federal lands. Kalama and Southwest Washington, and beyond will be better without this project.

Sincerely,

Charles Houghten

Gentlemen - I am very concerned about the proposed Kalama Manufacturing and Marine Export Facility. I understand the need to create jobs and economic activity, but because of the impacts on our air, water and community health, this project may be a deal with the devil.

It is widely accepted that this plant, once built, will instantly become one of Washington state's largest polluters. What is less well known however, is the nature of this pollution. It is toxic, and it is radioactive. Other towns with similar facilities have reported worrying health impacts, including cancer clusters.

As we all know, when dealing with such large operations accidents and spills are inevitable. I wonder about the wisdom of pursuing such a course if it poisons the town for our children and grandchildren. What will these jobs really be worth if in the future, the town becomes less desirable as a place to visit or raise a family. And God forbid something horrible occurs that makes this town uninhabitable.

Please think about the long term success of Kalama when deciding on whether to move forward with this project. There is still time to pursue more sustainable business enterprises, thus ensuring both jobs, income and livability for generations to come.

Dee Johnson

Please do NOT permit this plant to be built. Yesterday's (9/23) LA Times article is attached and gives a glimpse into our future if this plant is built.

A Methane Plant in LA was leaking methane gas for years while keeping leakages hidden. This was because the operators didn't feel it was important to warn their oversight & the vicinity. This article shows multiple incidents of methane leakages that were kept from the regulatory agencies and the public in general.

An excerpt: "The plant's compressor units had been leaking gas "for the last couple years," one staffer said. The utility had a plan in place to fix the compressors later in the year but decided to go public now because NASA's Jet Propulsion Laboratory had detected the leak as part of a drone survey, and "their information is getting more publicized," Adams told the board."

Please do not permit this project!

Los Angeles Times

Los Angeles hid a methane leak for a year. Activists want the power plant shut down

Sammy Roth 3 hrs ago

Andres Ramirez doesn't know who scrawled the words "SHUT DOWN THE PLANT" across a cinder-block wall outside Valley Generating Station, where red and white smokestacks tower over the northeast corner of the San Fernando Valley.

© (Myung J. Chun / Los Angeles Times) Activists have been campaigning for over a year to shut down the Los Angeles Department of Water and Power's Valley Generating Station. (Myung J. Chun / Los Angeles Times)

But in a neighborhood burdened by dozens of landfills, recycling centers, junkyards, trucking companies and other noisy and polluting industrial facilities — and bisected by three major freeways — the graffiti artist could have been almost anyone.

Residents of Sun Valley and Pacoima breathe some of California's worst air and suffer from asthma-related hospitalizations at rates far higher than most of the state. So when the Los Angeles Department of Water and Power revealed last month that its power plant had been leaking methane gas for at least three years, local outrage was loud and swift.

The leak "really fired up the community on this greater conversation of why is this plant even open still," Ramirez said as he walked past the facility's main entrance, stepped over sidewalk chalk art reading "KIDS DESERVE CLEAN ENERGY." He pointed out that the surrounding community is mostly Latino and low-income.

"For Black folks, it's police kneeling on their necks. For a community like Sun Valley, it's poisoning you slowly for 75 years," he said.

larry johnson

I grew up in Texas. I know the Oil Patch and internally, how it operates.

After completing my GI Bill in the 70's, I started my career as a Systems Engineer processing data in the Oil & Gas Industry working in Dallas and for decades later along the Gulf Coast working out of Houston.

Much like the tobacco industry, there were many internal studies made that revealed the perils of producing oil and gas. These internal studies and their incidental hazard reports were kept away from the public conscience. These studies were then used to minimize information on all publicly known hazards and avoided mentioning other hazards unknown to the general public. This was SOP damage control for proposed projects. This practice has always been there and will continue. I would expect the Chinese owners of this development are more accomplished at this spin/secrecy than their American counterparts.

While this Methanol Plant will be a short-term boon to the area by generating a thousand jobs for the short-term and a couple of hundred long-term jobs; the cost is too great. If you need more proof, take a ride along the Texas/Louisiana coastline. There lie the corroding remnants of a dyeing industry. To bring a dyeing industry and future Superfund site to the great Northwest is a travesty of the highest magnitude.

Please do not approve this permit!

Thank you!

Vivian Chin

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Suzy Titcomb

publicly opposing massive fracked-gas projects, halting new fossil-fuel infrastructure, and protecting our air, water, rivers, forest, health, safety, and climate.

Kay English

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We owe it to our children and grandchildren to tend to the "Garden" of our earth.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Kay English

We are in the midst of many crises at this beyond challenging time. One of the most severe, due to its lasting and damaging impact on our communities and the entire world, is the climate crisis. I have read your mission statement many times and the words, "To protect, preserve and enhance the environment for future generations" are excellent. Now, you must follow through and not allow Northwest Innovation Works, LLC to build its methanol plant at the Port of Kalama. To be truly innovative, sustainable energy projects must occur. As the Northwest continues to increase in temperature and decrease in rainfall due to climate change with its accompanying drought conditions and more sunshine and wind, why not innovate and seek bids on projects for solar energy and wind power. We are experiencing a climate emergency. If we don't act boldly and quickly, it will be too late to avert more climate catastrophes.

Paula Arms

The Department should deny any further permitting to NWIW for building a methanol refinery plant in Kalama. In Washington State, we should be making strong effort to combat climate change, not contribute to it. Every effort should be being made to reduce our carbon emissions, not raise them. And our beleaguered and precious Columbia River does not need one more polluting industry on its shores. As a resident of Cowlitz County, I am strongly opposed to the further industrialization of our area, and especially a refinery that contributes so many emissions to our local air quality and furthers the use of non-recyclable plastic on our planet. Considering the scope and intensity of the wildfires of this summer, Ecology should deny the permit to build a plant that will contribute to detrimental climate change, and also affect the air I breathe every day.

Sincerely,

Paula R Arms

Carole Connell

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Renee Burcal-Harris

I have degree from the University of Washington school of Oceanography. I would like to know if you have considered the effects of the air pollution that will converge and often linger in the same areas because of the Fjord topography as well as the surface waters where any leaked methanol will migrate then accumulate.

TeresaThe DepartmentThe Flynn

The Department Ecology needs to dismiss the speculative basis for this proposed project. The idea they would displace more polluting facilities using coal is not proven. Washington State needs to protect our citizens, living things, and resources. No Kalama Methanol Refinery! Teresa Flynn

Jay Monk

It is absolutely essential that the proposed Kalama Methanol refinery be denied its application for construction. The reason is simple: we cannot afford to build new infrastructure factory dependent for its functioning on using resources (Methane is a potent GHG) that contribute to the worsening of conditions in our climate and producing plastic which is known to pollute the water and land and people's bodies. The external costs associated with plastics production and its end of life process is enormous and Northwest Innovations LLC will surely not take responsibility for these costs in its factory and business model.

ANNE DOR

The report highlights the enormous amount of greenhouse gas emissions, which I find unacceptable. One of the reasons I moved to WA was due to its environmental record. I am against this project moving forward.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

The Department of Ecology needs to know when NWIW is dissolved; all bets will be off.

NW Innovation Works is the company responsible for:

- The \$2 billion loan to pay for the entire facility.
- Offsetting GHG emissions
- Using ULE and ZLD technologies for environmental permitting.
- Not using it as fuel.
- Donating \$1 million for the schools.
- Donating \$1 million for the fire dept.
- Providing the training money to employ 20% of its workforce.

Take NW Innovations out of the equation, and it's all a lot of hot air.

With NWIW out of the picture, Pan Pacific, the parent company of NW Innovation Works, will take over, and all prior commitments will be void. It will be a seamless transition since most of the same people work at both companies.

Pan Pacific is also a Delaware LLC company, and will not be responsible for any of its prior liabilities or promises.

According to an online article on INC Now-

A Delaware LLC exists as a separate legal entity from its members, creating a shield that insulates the owners from individual liability beyond their investment for the LLC's financial obligations. Unlike a corporation, the protection in an LLC also runs in reverse. This shield also protects the Delaware LLC from future judgments against individual members due to the state's exclusive "charging order" remedy. This means that a creditor who obtains a judgment against a member of the Delaware LLC can only receive that member's distributions from the LLC and not a voting interest, nor can the creditor of a member order the liquidation of the LLC.

They can promise anything within reason. The best thing is that the refinery promoters can say anything without worrying about the repercussions of their actions.

NW Innovation Works or PPE might try to explain to the county that the infrastructure will be put in at the end or are just waiting for the federal agencies to approve the permits since ULE

technology hasn't been approved in the U.S. yet.

By the time that the county figures out there's that there is no way that NW Innovation Works or PPE isn't going to use ULE or ZLD due to the feasibility issues, it will be too late. The county isn't going to care, since they never did care about the environmental reviews in the first place.

If they were going to use ULE, the language about CR would have been totally removed from the review documents. Instead, the documentation says: if feasible or, if possible.

I talked to an industrial engineer about the project to get his take on it. He asked me to see the engineering or the finished blueprints for the entire facility. I told him that the company has concept drawings and not layout as the whole and how all of these processes work together, including the ZLD and ULE technologies. He was very concerned and said that it sounded like a sham. He asked who is the person or company that could put all of these parts together and be able to run it.

When the permitting for the ULE or ZLD gets denied, or the financial equation doesn't add up, it will be too late, the pipeline will already be under construction. The company will begin the refinery and say that it's too late to stop it now. PPE will say that the previous company made those promises. The backers of this refinery will get what they have always wanted, a Canadian monetizing facility.

The person that signed all of the contracts, the president of NW Innovation Works, will be long gone. No one will be held accountable for all of the carnage that would be left behind.

How is the Department of Ecology going to be sure that this start-up company with no assets or income will be there two years down the road, much less thirty?

Amy Tejcka

September 18th, 2020

Dear Washington State Department of Ecology,

My name is Amy Tejcka. My husband and I live in Cowlitz County, Woodland, WA. We are approximately 12 miles downwind of the proposed methanol refinery in Kalama. For myself and my family I am asking – no- I am begging you, please, DO NOT allow NW Innovation Works to build the world's largest methanol refinery in our backyard!

We have wildfires currently raging right here in our midst. These ferocious fires are becoming more prevalent. Proponents claim it is "safe" to pipe in mega tons of fracked natural gas and turn it into methanol primarily to benefit the Republic of China. I realize that we have been promised a few jobs as well as some other perks that will seem like chicken feed compared to the profits likely to be made by the Chinese and their affiliates. But what happens to us if the east wind decides to blow a fire into Kalama?

Why would anyone consider building such a monstrosity in such a densely populated area? Why would we risk our beloved Columbia River, so key to the entire Pacific NW economy and way of life? What about the real possibility of a Cascadia Mega-Earthquake? What about the 5 million gallons of water the plant will be drawing daily from our local aquifer? What about our sadly dwindling salmon and steelhead runs?

Property values will likely tank locally, including my own, here in Woodland if this plant is approved. Folks are going to love the unsightly plumes of hazardous vapor clouds billowing up regularly, higher than those blown from the Mount Saint Helens eruption in 1980! Who wants to live near that?

This proposal is absolutely ludicrous! It's SO DANGEROUS! And what are we building it for – more plastic? We don't need more plastic in the world – we need less! And we DON'T NEED a methanol refinery in SW Washington!!

My grandchildren are 5 and 7 years old. Please protect their health and safety. It's their air and water we're talking about here. You are the Washington State Department of Ecology. It is your job is to protect Washingtonians. Please exercise your common sense and DO NOT grant this permit!

Thank you for listening.
Amy Tejcka

Woodland, Washington

Rich Doenges re: NWIW SSEIS
Washington Department of Ecology
Southwest Regional Office
P.O. Box 47775
Olympia, WA 98504-7775
submitted via Department of Ecology Online Public Comment Form

RE: Draft Second Supplemental Environmental Impact Statement for the proposed Kalama Manufacturing and Marine Export Facility

Dear Mr. Doenges:

Thank you for the opportunity to comment on the draft Second Supplemental Environmental Impact Statement (SEIS) regarding the proposed Northwest Innovation Works (NWIW) project at the Port of Kalama.

I urge the Washington Department of Ecology (DOE) to reject the proposal to build and operate the world's largest fracked gas-to-methanol refinery by denying the Shoreline Conditional Use Permit and any associated permits for the following reasons.

NWIW has sought to mislead regulators and the public regarding the purpose and impact of the refinery, falsely claiming that this project would solely produce methanol for plastics. This new SEIS demonstrates some important improvements in evaluating the true climate impacts of this proposed methanol refinery, including addressing the likelihood that methanol produced will be used as transportation fuel in China, not just for the production of plastics.

Burned as fuel, the Kalama plant's methanol would add between two and five million tons of carbon pollution per year. China just announced yesterday, however, that it will cut its net carbon emissions to zero by 2060. China is using this plant to transfer its emissions to other countries.

The SEIS has made some necessary adjustments in the methane leakage rates, but the estimated rates still are too low given the widespread under-reporting of leaks. Even given the unreasonable assumptions regarding the single-sourcing of natural gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the SEIS confirms that NWIW's proposed facility would be enormously polluting. The proposed plant would use up to 320 million cubic feet of fracked gas per day, more than all of Washington's gas-fired power plants combined.

Methane is a potent greenhouse gas, trapping 86 times more heat in the atmosphere than carbon dioxide. Nearly 20 percent of the Earth's warming can be attributed to methane. DOE concluded the methanol refinery would emit 4.6 million tons of greenhouse gases every year for 40 years.

It would become one of Washington's largest source of climate pollution at the same time we are trying to reduce emissions statewide. It would make our climate problems worse.

The evaluation of potential mitigation and displacement contained in this SEIS is misleading in its reliance on speculative, unproven and unenforceable assumptions. This displacement assumption is a major flaw in the SEIS. If China has sufficient petroleum imports, the low price of oil will negatively affect coal-to-methanol plant production. Global oil prices are likely to remain low. This means there will be little need for coal-based methanol in the plastics process.

The document is filled with generalities and unsupported statements. It is dangerous to presume this SEIS can accurately predict global fuel markets, technology developments, consumer behavior, or climate regulations for the coming four decades. Improved technologies are creating a growing commercial market for a variety of alternatives to traditional plastics. Growth in bioplastics will be fueled by a number of factors, including consumer demand for environmentally-sustainable products, the development of bio-based feed stocks for commodity plastics and increasing restrictions on the use of non-degradable plastic products, particularly plastic bags. Further, bioplastics manufacturing usually requires lower temperatures, further bringing down production costs and energy usage.

The SEIS assumes no new climate regulations, no changes in the world economy, no new technologies and no new developments in trade policy for the next 40 years. This is not realistic; we cannot predict the future.

The air quality analysis is particularly weak. Methane is emitted during the production and transport of natural gas. Methane in the air absorbs the sun's heat, warming the atmosphere and creating one of the most basic forms of air pollution. Haze is caused when sunlight encounters tiny pollution particles in the air, which reduce the clarity and color of what we see, especially during humid conditions. Haze degrades visibility over our public lands. Hazy days don't just block the view; they mean the air contains particulate matter that can compromise human health.

The Clean Air Act gives special air quality and visibility protection to national parks larger than 6,000 acres and national wilderness areas larger than 5,000 acres that were in existence when it was amended in 1977. These "Class I" areas include Mount Rainier, Olympic and North Cascades National Parks and Mount Adams and Goat Rocks Wildernesses in western Washington.

All other federal areas are "Class II" allowing for a moderate amount of air quality deterioration. Because air pollution is often regional in nature, reductions in pollution to improve visibility in Class I parks and wildernesses will also improve visibility in all other parks and wildernesses in the surrounding area. Class I areas are managed by the National Park Service, U.S. Fish and Wildlife Service, U.S. Forest Service, and several Native American Tribes.

When greenhouse gasses are combined with wildfire smoke, as happened recently across Washington and Oregon, that air pollution also makes people more susceptible to complications from COVID-19. The Centers for Disease Control and Prevention warns on its website that wildfire smoke irritates the lungs, causes inflammation, impacts the immune system and makes people more prone to lung infections such as the virus that causes COVID-19. Air pollution

disproportionately affects already vulnerable people including those with chronic illness (e.g. heart or lung disease), children, older adults, low-income communities, and communities of color.

The SEIS assumes that air quality will improve in the future, despite the NWIW plant emissions, due to the expectation that the Environmental Protection Agency (EPA) will issue new, more stringent, air quality standards for methanol and tanker emissions. This assumption is unrealistic when the EPA has instead been relaxing standards. In 2016, Columbia University scientists showed that climate change has doubled the area of the western U.S. affected by forest fires over the past three decades. “Climate is really running the show in terms of what burns,” one of that study’s authors said. “We should be getting ready for bigger fire years than those familiar to previous generations.” The SEIS should anticipate more times of hazardous air quality exacerbated by both the cumulative climate impacts of the emissions from the proposed project and the day-to-day unavoidable impacts of the proposed project’s emissions when combined with other hazardous air events like wildfire smoke.

The SEIS provides too little detail on the actual mitigation that would be accomplished within the “voluntary” mitigation framework, and this mitigation fails to address the full impacts of NWIW’s emissions that will occur both “upstream” during gas extraction in Canada and transport to Kalama and “downstream” after the methanol is manufactured and transported to China.

The “upstream” impacts include the industrialization of rural landscapes, abandoned and leaking wells, cumulative impacts to aquifers, mining of groundwater, loss of agricultural land and impacts to poor and indigenous communities. Abandoned gas wells deteriorate over time, the steel piping and cement corrode, and methane leaks into the air. There are an estimated 29 million abandoned gas wells globally. There is not any regulatory requirement to monitor emissions from abandoned wells. The oil and gas industry fought fiercely against the Obama administration’s efforts to start regulating methane emissions. A 2016 rule requiring operators to measure methane releases at active wells and invest in technology to prevent leaks was overturned by the Trump administration at the beginning of August 2020.

The only way to keep the well from leaking is to fill it up. Plugging a well costs \$20,000 to \$145,000, according to estimates by the U.S. Government Accountability Office. Plugging does not last forever, however. Scientists and engineers debate how long cement can survive in the harsh environment of the Earth’s interior. Estimates typically are between 50 and 100 years so eventually the wells will leak methane again.

Another issue is how much greenhouse gases will be emitted by refining a fossil fuel with electricity. Greenhouse gases from purchased electrical power are significant and should not be under-estimated. I am concerned that the large load of electricity for this facility will be permitted a share of the currently limited clean power sources in Washington. We are not conserving electricity and investing in clean power generation just to power a dirty fossil fuel facility to send our resources to China. Removal of the Snake River dams to save salmon should be higher priority than this project.

The mitigation framework is too vague for DOE to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option, after all other impacts are reduced in order to address unavoidable impacts, not simply to maintain the status quo.

The Intergovernmental Panel on Climate Change (IPCC) is the United Nations body for assessing the science related to climate change. Last month the IPCC published a statement on the 30th anniversary of the First Assessment Report, which was a robust, rigorous, exhaustive and transparent assessment of the state of knowledge of climate change. From the First to the Fifth Assessment Report, there has been substantial progress in understanding of climate science. "The main message from the Fifth Assessment Report is that the scientific case for urgent action on climate change is clearer than ever. We have very little time before the window of opportunity to stay within 2°C closes forever but we still have that opportunity. The choice is within our hands. The Fifth Assessment Report provides a framework to support good decisions and better integrates adaptation, mitigation, development and equity."

This refinery would commit Washington state to decades of fossil fuel consumption and air pollution, contribute substantially to climate change, use vast amounts of fresh water and expose citizens of the Pacific Northwest to health and safety risks – all for a Chinese-backed company to make profits at our expense.

It is unacceptable for Washington state to issue permits for such an enormously polluting methanol manufacturing facility based on speculative analysis and unsubstantiated hope of theoretical emission reductions. It is profoundly inconsistent with achieving Washington's climate goals. This massive polluter should not be built anywhere. DOE should dismiss this proposal and deny state permits.

Sincerely,

Susan Saul

Robin Cody

My daughter and granddaughter live in Vancouver WA, just 28 miles south of Kalama. I'm worried first about their safety when it comes to converting natural gas to methane. Both gasses are highly explosive. An earthquake, in particular the overdue "big one" could shoot flames right down the Columbia River shore. What's the point anyway of shipping methane to Asia? The gas is is a notorious contributor to global warming. Please let's not let Washington State export a substance that fuels climate change, the enemy of forest products and clean air.

Joanne Parrent

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Cheyenne Ness

And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Debi Zickefoose

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Linda Leonard

Northwest Innovation Works' states it will voluntarily mitigate 100 percent of all in state direct and indirect greenhouse emissions in Washington state. As for being voluntary, offset carbon emissions was the stipulation required for the shoreline conditional use permit.

The SSEIS shows the Voluntary Mitigation Framework has no details on how mitigation will be accomplished.

Footnote 40 on D-2 reads: NWIW is undertaking research how to configure and account for the Voluntary Mitigation Program, including consideration of forming an independent nonprofit arm to administer the funds.

Additional conditions and required fulfillment documentation will be developed in coordination with Cowlitz County and the Department of Ecology following the completion of the environmental review of the facility.

The citizens of this state are being excluded from knowing anything more about the Voluntary Mitigation Program Framework.

How can the public make their own analysis in regard to this project?

Northwest Innovation Works' identifies no specific projects or measures that will address the enormous greenhouse gas pollution impacts. The Department of Ecology should not base the permit approval on speculative assumptions.

The decisions made will last for decades, we cannot keep ignoring climate change, time is running out.

Please deny the permit.

Diane Kochendorfer

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Diane Kochendorfer

Natalie Reich

You have already received boatloads of expert testimony from experts and other concerned citizens. I simply want to add my name to those who are opposed to this behemoth of a fossil fuel project. Given the abundance of evidence that we are already in the thick of climate catastrophe, we cannot put off acting if we have any hope for a healthy existence now and in the future.

Thank you for saying NO to the Kalama Marine Manufacturing and Export Facility currently proposed, and to any future proposals.

Natalie Reich

Linda Matthews

I oppose the construction of the Kalama Manufacturing and Marine Export Facility. The consensus on the world's scientists is that stabilization of the earth's climate requires reduction of greenhouse gas emission to net zero in less than a decade. All members of the global community must take unprecedented action to limit global greenhouse gas emissions beginning immediately. Building a new mega facility that will contribute enormous amounts of greenhouse gases to the atmosphere will further destabilize our climate.

Cyndra Norman

I stand in opposition to the KMMEF facility to produce methanol from natural gas. It is clear we need to reduce greenhouse emissions now in order to avoid further destabilizing our climate. Methanol is a known greenhouse gas. Please, for the sake of our grandchildren reconsider the building of KMMEF.

George Keefe

Dear WA Department of Ecology,

Dennis C

At best, this SSEIS assumes "business as usual" with zero success in mitigating GHG by replacing fossil fuel energy sources with sustainable energy sources. The Department of Ecology should be doing its best to protect air quality and the climate from polluters. I believe that this assessment is a travesty!

Julia Sokoloff

Kalama Manufacturing and Marine Export Facility Second Supplemental EIS

As a longtime resident of Washington, as a physician with a public health background and as a citizen of the world, I need to add my comments on the proposed Kalama Manufacturing and Marine Export Facility.

As a member of the Washington Academy of Family Physicians Public Health Committee, I am very concerned about the air and water discharges that would result from this refinery. The Columbia River Aquifer is very sensitive and could be irreparably damaged.

The proposed methanol refinery would lead to millions of tons of greenhouse gas pollution each year, and once built it could not be shut down for the life of the refinery, some 30-40 years.

Ecology's own analysis shows that the project would produce 4.6 million tons of carbon pollution each year, or more. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C.

In 2018 and 2019, NWIW informed potential investors that methanol from the planned refinery could be burned as fuel overseas, in sharp contrast to claims NWIW made to local and state regulators that the methanol would only be used to manufacture plastic. Now, Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year.

Washington State needs to take a stand and not make a commitment to the fossil fuel industry to allow the industry to use our land and our shoreline to ship methanol overseas under long term contracts.

The risk to our environment in Washington from potential leaks and discharge from the plant damaging our fragile Columbia River Shoreline is not acceptable. Ecology should deny the Shorelines permit for the refinery.

Why should Washington State take the risks to our environment and the health of our population for a small number of jobs, only to provide fuel for pollution in China and elsewhere. The voters of the state of Washington should say that we are not going to sacrifice our health and our environment to further the destruction of our planet. We are seeing the early effects of climate change now, and the effects will be exponentially worse in 10-20 years, but the plant once built will be irreversible.

Please let the voices of reason from the citizens of this state be heard before finalizing the Second Supplemental EIS.

Sincerely,

Julia Sokoloff, MD

Family Physician, Kaiser Permanente

WAFP Public Health Committee

Jean M. Avery

When I originally wrote this on September 15, I was sitting indoors for another day, because of hazardous air quality from the wildfires. I wondered if and when we would be able to enjoy the outdoors again in beautiful Washington state. I kept checking the air quality alerts on the Dept. of Ecology's website, with maps colored in red and purple.

While on the same website, I also saw an article about a past "Clean Air Month." This article had nostalgic overtones: reminders to reduce our vehicle emissions, ride a bike, not let our cars idle, take the bus, buy a ZEV. Then the article restated Ecology's mission "to protect and enhance the environment today and for future generations."

Under consideration now is a proposal from an international company to build a huge methanol refinery in Kalama and operate it for 40 years. According to an independent study by Sierra Club, the refinery would emit millions of tons of greenhouse gases per year, "equivalent to 2.4 million cars." The refinery would also consume "more fracked gas than the region's biggest cities combined," making it "Washington's largest climate polluter by 2025."

If one project can undermine Washington's efforts to keep our air clean, why should such a project even be considered? I fear that any approval of this project would also undermine Ecology's credibility to represent Washington as "a leader in responding to climate issues" (from "Clean Air Month" blog, May 26, 2018).

I urge the Dept. of Ecology to deny the permits for this project.

Bill Adams

This fossil fuel project should not go forward mainly for its dependence on mostly fracked natural gas. There's nothing remotely good about fracking. It's only purpose is to bring more fossil fuels into the world when the world's scientific community says we need less. Less so that we can transition to clean, renewable energy which does not pollute. This transition is not going to happen overnight but it has to happen if we are to have a planet that is safe and habitable. 97% of the world's scientific community are behind me in making this statement. This project with its voracious appetite for mostly fracked gas, a fossil fuel, will only slow the transition. Clean, renewable energy is inevitable. Why delay it with a project of this magnitude which would also be a major polluter? Please deny it. Thank you,

Bill Adams

Linda Leonard

Industry is a major contributor to climate change. The more fossil fuels are extracted and burnt, the more earth will be impacted for generations to come.

Scientists have long acknowledged the fingerprints of global warming with the massive wildfires in the West, the large recorded numbers of hurricanes in the oceans and the extreme weather conditions throughout the world.

The proposed methanol refinery in Kalama would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year.

Our climate future is at stake from this project. We will be handcuffed to this dirty fossil fuel infrastructure for the next 40 years.

It seems Kalama has everything to lose from this venture and Northwest Innovation Works' LLC, a new company backed by the Chinese government, will reap the rewards.

What a price the citizens of this area will pay! Please deny the shoreline permit.

Jean M. Avery

The NWIW refinery would be harmful to oceans and marine life -- both because of shipping and also because of the plastics produced.

SHIPPING

The marine route from Kalama to China is more than 5,000 nautical miles (p. C-13). Added into the Second SEIS is a stunning map of the route: literally from one end of the earth to the other (p. 48). Huge tankers would transit down the Columbia River -- across the dangerous Columbia River Bar -- three to six times per month. After unloading, the vessels would return empty. This 10,000-mile round trip would use marine fuel, which impacts water quality and marine life. There are also risks of spills. None of this would be mitigated, because the SSEIS clearly states that there will be no mitigation outside of Washington state.

PLASTICS

The Second SEIS states that the end uses of methanol would be 40% fuel and 60% olefins. Olefins can be used in plastics, resins, fibers, lubricants, and gels.

According to the Ocean Conservancy, plastics pollute oceans from the surface to the sea floor, affecting all forms of marine life -- from planktons to whales. Studies show that plastic has been found in sea turtles, sea birds, and even fish sampled from restaurants. In addition, there are harmful impacts to local economies if seafood or beaches are spoiled. The best solution is to prevent the plastic production at the source. Plastics are harmful to oceans, marine life, waterbirds, and beaches -- and yet, there is no planned mitigation by NWIW for such environmental damage.

GLOBAL IMPACTS CANNOT BE MITIGATED

In summary, the NWIW refinery could have widespread deleterious effects on oceans globally. If the Dept. of Ecology approves this project, might Washington inadvertently be harming oceans far beyond its borders? This is certainly not consistent with Ecology's stated mission. In fact, such a globally impactful project is likely beyond the purview of one state's Dept. of Ecology.

Please deny the permit for this project.

scott daly

I am a Kalama resident Opposed to the Methanol Plant in Kalama for the following reasons:

1. Health – Planned emissions may be below US environmental safety laws, but the overall history of medical science is that the acceptable levels of the past are found to be unacceptable as medical technology and diagnosis capability improves. Plus, there is always the concern of accidental releases.

2. Safety – Possible explosions due to gas leaks, as well as methanol production, such as has occurred in in Garland TX, 2012, and in Tianjin, China 2015 (killing 173). Proponents of the plant cite these explosions were caused by human error, but the Kalama plant will also be operated by humans, capable of new unforeseen errors. Plus, China's record on chemical factory explosions is poor. They haven't improved since the 2015 explosion, as there were explosions in 2018 in Hebei province (killing 23), and another in Sichuan this year (killing 19). While the US OSHA laws generally result in higher safety than China's, skirting of these laws by companies is not infrequent, often at the top-down directive of upper management and ownership (which will be Chinese for NWIW). Even in the EU, with very stringent safety regulations, there was a recent methanol plant explosion in Norway (Dec 19, 2018). Even if the explosion is contained within the site, which is an argument of the proponents, this area is heavily wooded and the region has been subject to extreme wildfires due to drier summers. Average wind speeds would be enough to cause a fire to spread into the nearby forests, then to the rural homes, and finally to the town of Kalama.

3. Impede new residential development and Aesthetics- Installing a >150' emission tower in a new part of town separated from the existing smaller emission towers will degrade visual environment, and likely start a new sprawl of such emissions towers. It will easily be visible from I-5, as well as many homes in the hills around Kalama river road, and to those on the north and west sides of Green mountain (While I live on the south side of Green Mountain, I do care about impact to my neighbors, and community). Kalama is poised to grow into a tourist and potential business office area, with its relative proximity to the PDX airport, and new attractions such as the McMenamin's Harbor Lodge, the scenic location, and recreational access to the Columbia river. There is a large subdivision being planned for Spencer Creek basin, and the flare stacks will be visible from that neighborhood, and impact the value of those homes, or hinder any interest. Let us continue to move in that direction of residential growth, business offices, tourism and entertainment, as opposed to a chemical factory that will pull us toward the past. Aesthetics are important and affects all local residents' home values.

4. Plastics - Right now in Cowlitz county, plastics recycling has failed, and there is continual evidence and reporting of increasing plastics' pollutions in our oceans, especially in the scientific press. We should not contribute to the plastics industry.

5. Financial – There is no clause in the contract for the factory owners to pay for the dismantling of the factory and tower if the economics don't work out. Given latest situation on tariffs between the Us and China, the financial viability of the plant is nowhere certain. If that happens, we will be left with a rusting eyesore, like are seen throughout the rust belt and creating disincentive for companies to locate offices there.

6. Scale of the factory – This is too huge for Kalama. the plant will consume more water than the entire city of Kalama, and more gas than the major NW cities combined, including Seattle, Portland, and Spokane.

7. Opening the door to further gas production facilities in Cowlitz and Clark counties- The inner mountain states like Utah, Wyoming, etc., do not have port access, and want to use our ports for closest access to the Asian market. Once this pipeline is increased, and branched off to this site, the door is open for many other similar plants as the volume of gas produced in those regions far exceeds their ability to economically transport it by other means (such as via the heavily polluted Gulf of Mexico region). We do not want to end up like that region, which is well known for extremely poor health, and threats to its fishing industry. We shouldnt be sacrificing our health, safety, and quality of life to the needs of the inner mountain states, who through their own poor planning, have economies that are overly dependent on resource extraction. I used to live in Utah and still have friends there, and they are frustrated at the amount of political power the energy extraction companies have over their lives.

Mike and Rita Mahaffa

Methane is in many respects a more dangerous planet killer. We strongly oppose increasing the potential proliferation of gas which will hasten making this planet uninhabitable. Classic short term benefit for a few in exchange for poisoning the earth.

Lisa Dennison

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

We are called to be steward of God's creation- not pillagers of it.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms. Lisa Dennison
7500 11th Ave NW Seattle, WA 98117-4143
lisa2karl@aol.com

Ryan Schrader

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Kathy Wilmering

I appreciate that Ecology has consistently worked to keep pollution in our state to a minimum within the framework of legislative approval. I also appreciated that you insisted on a more extensive analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington. I urge you to reject permits for the project. I thought their argument that although the plant would increase global emissions, it would be less destructive than other fuels used overseas was very creative. However, given that China is rapidly moving to solar and other cleaner alternatives, their argument does not hold water. Plus their proposed mitigation plan for our state is vaguely written and is voluntary, which is a setup for foot-dragging.

As part of my comment, I want to include the information below in quotation marks. Although I did not write it, it represents my opinion much more clearly than I could write.

"This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. The evidence in this draft SEIS demonstrates that Washington should deny NWIWs proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change. "

Please rule to keep us on track to transition from fossil fuels. We have no more time to waste.

Linda Horst

I find it unsettling that even though Ecology found NWIW's 2018 mitigation proposal inadequate, this 2020 version has not been significantly improved. Misleading and concerning in its reliance on speculative and unenforceable assumptions, this Voluntary Mitigation Program (VMP) is really nothing more than a 'plan for a plan'. Pure flim-flam!

Mitigation is how rich fossil fuel companies buy their way out of the harm they cause! No mitigation will stop the pollution and environmental degradation inflicted upon Washington's current and future generations by this refinery.

Also disgusting, is the much hyped 'net green project' mantra. If this refinery is the environmental panacea NWIW claims it to be, why is every NW environmental organization opposed to it?

As a 30-year area resident and life-time Washingtonian, this refinery hits painfully close to home. If built, my family and hundreds of thousands of people like us will be forced to endure the myriad negative impacts of this dangerous, polluting behemoth for THE REST OF OUR LIVES!

As Governor Inslee said years ago, "We are the first generation to feel the impact of climate change and the last generation that can do something about it. Now is the time to act." Our Governor is right. Stop the madness. Deny the permit.

Elly Claus-McGahan

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

As you know we have a state goal of reducing emissions by 45% below 1990 levels by 2030. It makes no sense to then support a project that will make it even more of a challenge to meet this goal than it already is. Further we need to acknowledge that the world doesn't care where emissions take place, only that they did take place. That's enough to cause the enormous damages we now see from fires, storms, droughts, and freak winds to name only a few aspects. It is not cost effective to support a project like this given the growing tremendous costs we all have to pay to deal with the damages of climate change enhanced natural disasters, both in actual cash outlay and in human terms of things like loss of housing, food shortages and the like. With China also announcing its

desire to go carbon neutral, it's not wise for us to instead grow our emissions with plants like these.

The evidence in this draft SEIS demonstrates that Washington should deny NWIWs proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Paul Sampson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Paul Sampson

Vicki Johnson

Washington state has already paid the price for "clean" energy when we allowed Hanford here. Fish populations up and down the Columbia have suffered greatly, some may never return to optimum populations ever again.

This Natural gas plant is just another knife in the heart of our wild creatures and the environments that support them.

STAY OUT IF WASHINGTON

Don Steinke

Regarding Kalama Methanol. Please respond to these questions in your final SEIS.

1. Is this proposal consistent with the sense of urgency in the latest IPCC report?
2. Is this proposal consistent with the Paris Climate Accords which China signed?
3. Inslee's Clean Air Rule requires polluters like Kalama Methanol, and the paper mills in Longview, to reduce emissions 5% every three years. How will this project comply?
4. Will pipeline leaks be monitored and fixed promptly?
5. Exactly how will the company mitigate their emissions and will their plan mitigate the instate emissions the first year? It takes years before a planted tree is very effective in capturing CO2.
6. When given a range of impacts, why did you choose the least harmful option, instead of the worst-case scenario?
7. The models that EPA and others provide for estimating emissions are notorious for low-balling. In particular, I'm thinking of the fugitive emissions of methane and the emissions from flaring from the fracking fields, the pipeline gathering area, the compressor stations and the pipeline. How will you compensate for EPA's flawed models?
8. Are you using the 20-year or the 100-year global warming potential for fugitive methane? The next 20 years are the most critical. Why not use the 20-year global warming potential?
9. China has committed to electric buses and cars. The availability of cheap methanol for fuel could displace EVs. Include the emissions impact of that.

Gino Ceravolo

I don't understand how it can be said that adding fossil fuels into the economy will reduce greenhouse gases. Building a new facility with a 40 year life is dooming us with 4 decades of fracking wells polluting people's groundwater with undisclosed toxins, fracking wells actively leaking methane even after they are no longer in use, methane leaks along a pipeline that is laid across seized lands, CO2 release, massive amounts of our local energy being consumed for the profit of a foreign company, and then this methanol continuing to harm the atmosphere after it leaves the United States.

The Washington Department of Ecology is the last potential roadblock to this catastrophic project. How is it that well over 40 years after global warming was confirmed by scientists that our progressive state might allow a new fossil fuel facility on the shores of our Columbia River? My children look to you to give them hope that they are seen, that you understand the science and existential threat of the Climate Crisis, and that you will stand up for their future.

Thank you,
Gino Ceravolo

Don Steinke

Regarding Kalama Methanol

The business as usual market conditions you use if the Kalama methanol plant is NOT built does not include two mid-course corrections China has made on emissions policy, after the Kalama methanol plant was proposed.

In 2015 in Paris, China agreed to peak emissions by 2030, and then rapidly reduce emissions after that.

On Sept 22, 2020, at the United Nations, China promised to peak earlier than 2030 and be carbon neutral before 2060.

That means if the Kalama methanol plant is NOT built, policy makers in China will be reducing emissions wherever possible. They are not likely to consider single use plastic to be essential and thus not continue business as usual.

Mayors in China are required to reduce emissions and will be looking for ways to do that. (Source: The Question, by Daniel Yergin)

Eliminate or change the speculation about what would happen if Kalama methanol is NOT built.

Larry Horst

Northwest Innovations Works wants to put the health and safety of our community at risk so they can use massive amounts of fracked gas to make methanol that will be exported to China to be burned as fuel and used to make more plastic. I oppose this refinery because it is bad for Kalama, Washington state and the planet.

Kevin Walsh

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Paula Overholtzer

I'm a retired teacher, having taught 30 years in Clark County, and one year in Chongqing, China. Throughout China, the skies are gray with Industrial Air Pollution. I know all about that!

Before becoming a science enhancement teacher for Battle Ground Public Schools, I had transformed my classroom into a Rain Forest, complete with water-misters, a water-fall, tropical plants, live reptiles and birds, plenty of posters, books, and films about wild-and-scenic places.....along with discussions about Ecology. Young students recited this "Earth Day" mantra: "Because the Earth is my home and needs my help to survive, I will try my best to respect the Earth at all times by conserving energy, recycling, and buying and using those products that are least harmful to the environment." Fracked Gas does indeed qualify as extremely harmful to the environment, along with pipelines, releasing greenhouse gases, fossil fuel spills and leaks, burning methanol as fuel in China, and the endless stream of single-use plastics.

Another consideration for me is the extreme amount of both Fracked Gas and Electricity to be used by this Methanol Refinery! It seems probable that the cost of these two commodities would go sky-high for Washington residents because we'd be competing with the Refinery for them! But many seem willing to squander away a peaceful, healthy existence for Peace River's Indigenous population; to allow transport of extracted gas through certain-to-leak pipelines passing through our state; to allow enormous amounts of Greenhouse Gas Emissions to pollute our state's air (and this planet-in-crisis); and then to voluntarily pay more (due to high demand) for the Natural Gas, Water, and Electricity that we need for our own current uses. It doesn't make any sense. And it doesn't make any sense that China would give up some of its coal-powered refineries just because, "Those people in Washington decided to allow the construction of the biggest fracked-gas-to-methanol refinery in the world!"

It is heart-breaking to realize that this proposed atrocity on the Mighty Columbia River is all about jobs, port rent receipts, tax revenue, high profits for a foreign developer, and, if truth-be-told, bribes behind-the-scenes. It cannot be worth it. We, as a human species need to act now to save our planet. Subsidized fossil fuel extraction and usage is devastating this world. Now's the time to make the switch to green, renewable energy. Our state is supposed to be all about that! Cowlitz County's citizens could be put to work building light-rail or a high-speed magnetic-levitation train along the I-5 corridor from Portland to Seattle, for instance! Good jobs!

At one rally I attended along the Kalama River, during which kayakers paddled past with signs that read NO FRACKED GAS..... and, by the way, two of my former students were among those activist kayakers!..... I was the person carrying the big sign that read, "Best Governor: Jay Inslee." It had been announced that Governor Inslee had come off-the-fence and proclaimed his disapproval of the Methanol Refinery. I supported him as the "presidential candidate with a strong environmental focus!!"

I hope that we can continue to count on our Governor, who claims concern for the Climate Crisis, along with Laura Watson and her Department of Ecology Team, to lead the way by rejecting another Fossil Fuel Disaster. Neither Indigenous Peoples of Canada nor citizens of Kalama wish to

reside in "sacrifice zones."

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

The concerns that I have is that there are two major deciding factors when it comes to tax revenues for the state and county coffers.

One of the major factors in deciding valuations of this refinery would be based on its capacity to generate income in the future. If this refinery sits idle like most of the methanol production was in America did only a decade ago, there would be significant disruptions in tax revenues. The methanol facilities were closed for years, and some just only recently started operating again.

The fossil fuels that methanol is made from would play a major part in the future of this refinery. Natural gas, oil, coal, and methanol market prices are all extremely volatile. Prices and the supply and demand for this product would fluctuate daily. The refinery would depend on almost all of these fuel types since Asia will buy methanol from the lowest producer, and they can source the methanol easily from any or all of these feedstocks.

There are other major factors that are not under our control are in Canada, where all of this natural gas is coming from including fracking regulations, tariffs, and other environmental concerns.

The second factor is based on the improved values of the property itself. It decreases substantially every year due to diminishing values.

We need to use this land for a project that produces more than 1.2 permanent jobs per acre after factoring in mitigation for this refinery. We also need to build the facilities here, not in another country, and assemble it when it arrives.

Cowlitz County leadership needs to stop hoping for a large, heavy industrial user or a massive fossil fuel company to save it. The Cowlitz County Economic Council needs to get businesses that would add a more secure economic engine to the county.

The day I knew that the county was in trouble was when the newsletter of a local business magazine said that Cowlitz County is looking forward to three things in the coming years.

1. The coal terminal.
2. The marijuana industry.
3. The methanol refinery.

If you went to any other city or county in the state and said that this is what the county is looking forward to, they would vote you out as fast as humanly possible.

Linda Wysong

Dear Department of Ecology,

Please do not allow the world's largest fracked gas-to-methanol refinery along the majestic Columbia River impacting Kalama and the whole region. If built, the proposed Kalama methanol plant would use staggering quantities of fracked gas, fresh water, and electricity to produce methanol for export to China.

The NW is burning, forests and homes are being destroyed and we can't breathe. Climate change is not some far off myth but our daily reality. I live just across the Columbia River In Oregon. This impacts all of us.

For the community of Kalama and for our climate, the risk is simply too big. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution. I am counting on you to do the right thing and stop this dirty, dangerous fossil fuel export project.

Linda Wysong

Lori McKenna

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. Washington Department of Ecology
(submitted via on-line comment portal)

RE: Kalama Manufacturing and Marine Export Facility

Dear Ecology:

I oppose the permit application of NWIW for the KMMEF. You should deny the application.

I am an ordinary citizen with two children and two grandchildren and I am very concerned about the future of our earth's environment for their sake. I agree with the IPCC that it is crucial to take immediate steps to reduce GHG emissions. However, the KMMEF if built will greatly increase the total GHGs emitted in Washington (between 786,117 and 1,421,748 million tons annually, SSEIS p. 86), making it much more difficult for us to meet our state GHG reduction goals.

It is your obligation to review the proposed permit under SEPA to assure it meets state goals. The proponents claim they plan to fully mitigate their in-state GHG emissions using yet to be developed methods, but they have no existing method of doing so. Pursuant to RCW 43.21C.060, "(m)itigation measures shall be reasonable and capable of being accomplished." Even assuming the technology and availability of mitigation will exist, the overall increase in GHGs will make it more difficult for the state to meet its goals by removing potential mitigation reduction credits from the state market while still adding significantly (among the top 10 Washington emitters) to state GHG emissions and doing nothing to reduce total annual emissions.

You must evaluate a proposal under WAC 197-11-782 for how probable its outcome is Under WAC 197-11-794, an adverse effect may be considered significant even if its chance is not great but if the resulting impact would be severe. In this case, its proponents agree the likely GHG emissions from construction and continued operation of the KMMEF would be great and continue for approximately 40 years. Although the SSEIS argues on balance global GHGs would be reduced, the impact to Washington is so significant and the likelihood of full mitigation so unknown the permit should be denied.

Claims of global reduction of GHGs if KMMEF is built are speculative

The SSEIS states that all worldwide methanol demand will be met with or without KMMEF (SSEIS pp. 54 and 75). It further argues that under the most likely scenario, global emissions from methanol

production with KMMEF in place would be 55% less than without (SSEIS p. 76). However, because so many factors considered and conclusions stated by the SSEIS are either uncertain or unsupported, this conclusion fails to meet the definition of "probable" under WAC 197-11-782.

For example, the ESM assumes that methanol from Kalama will replace methanol produced by coal in China to varying degrees (SSEIS p. 52). However, the SSEIS also explains that KMMEF production will replace higher cost methanol in the market (SSEIS p. 52).

The SSEIS does not establish that coal-produced methanol is a higher cost product. It currently is the most profitable Chinese methanol (SSEIS p. 71). In fact, it seems likely that Chinese methanol produced from coal will continue to have a lower cost or be preferred by Chinese buyers due to political factors in the Chinese economy. Because the assumption that KMMEF methanol will replace methanol from Chinese coal is unsupported and contradicted by the evidence, the conclusion that KMMEF methanol will replace Chinese coal-produced methanol does not meet the probability test.

In addition, although the SSEIS states the market in 2019 was capable of producing approximately 50% more methanol than was used*, it also concludes that producers will continue to produce methanol, even at a loss, in order to benefit from expected future profits (SSEIS p. 68). If producers are willing to operate at a loss, they will sell their product at a lower price than KMMEF in order to assure future sales. In that case, KMMEF methanol will not replace other global sources.

Mitigation

KMMEF proposes to fully mitigate all in-state GHG emissions by designing a voluntary mitigation program. While its promises sound good, KMMEF cannot point to any existing method of mitigation nor does it specify exactly how it will be able to mitigate the huge negative environmental impact KMMEF will create on Washington's airshed. Whether it will actually be able to completely offset all GHGs for the full life of the plant and how it will do so remain completely speculative. KMMEF has not demonstrated its mitigation measures are capable of being accomplished as required by RCW 43.21C.060.

Furthermore, assuming mitigation measures such as carbon credits are available in the future, there may be a limited supply. The large amount of credits KMMEF will need will result in fewer credits available for other emitters, meaning there may simply not be enough mitigation measures in Washington to meet the overall need.

Finally, even assuming KMMEF is able to fully mitigate all of its annual emissions, doing so merely returns Washington to the current GHG count but does nothing to meet state goals for GHG reduction.

Conclusion

The SSEIS cites numerous other bases for uncertainty for its conclusions. See, e.g., SSEIS pp. 68, and 105. Under SEPA the outcome of an EIS must be probable. With so many uncertainties, the proponents cannot meet their burden.

Polluters often use the promise of future jobs as an excuse for their climate destroying operations. In this case, NWIW has continued to claim without credible factual support that not only will they

create jobs but they will magically reduce worldwide global GHG emissions by substituting "cleaner" methanol for "dirty" methanol. Ecology did not buy the promises made in NWIW's first and second EISes and it should not buy them now.

Washington citizens rely on the Department of Ecology to protect us and our environment from pollution, consistent with state laws. The future livability of our state and our climate depend on every jurisdiction doing its job to reduce global GHG emissions consistent with the IPCC findings.

For the sake of our children and grandchildren I hope you will deny this permit.

Thank you for your consideration,

/s/

Peter Fels

* At one place in the SSEIS global methanol production capacity is listed as 153 MMT (SSEIS p. 50) and at another place 157 MMT (SSEIS p. 68); while global use in 2019 was more than 98 MMT (SSEIS p. 50).

Peter Fels

* At one place in the SSEIS global methanol production capacity is listed as 153 MMT (SSEIS p. 50) and at another place 157 MMT (SSEIS p. 68); while global use in 2019 was more than 98 MMT (SSEIS p. 50).

Wayne Winther

I absolutely oppose building the world's largest methanol refinery here in Kalama. The climate crisis is getting worse every year. I don't see how anyone could be in favor of adding millions of tons of greenhouse gases to the atmosphere every year, not to mention the other pollutants this refinery would create. For the sake of all of us in Kalama, Washington, America, and the planet, do not allow this facility to be built. We all know the motivation for building the refinery is the greed of a limited number of people here and in China. It's time to be realistic about the climate crisis and put a stop to building monsters like the methanol refinery.

Don Steinke

Four questions

As I understand it, Kalama Methanol has no assurances of pipeline capacity. What will happen when demand exceeds capacity, which is likely when the temps drop below 40 degrees F?

Will the Jackson Prairie storage facility be used, and what will be the associated emissions from that?

Will a new pipeline be built, and what will be its associated emissions?

Until June of 2020, it was illegal to ship LNG by rail because it was too dangerous. But in June, the Trump administration approved LNG by rail.

It is now easier to put LNG on rail, than it is to get a building permit for a new commercial building with gas. For this reason, the Vancouver City Council has imposed a moratorium on all new bulk fossil fuel facilities.

What will be the ghg assessment for LNG by rail?

Jean Avery

The SSEIS clearly states that NWIW will provide no mitigation outside of Washington state. What about the 1400 miles of pipeline that will be constructed? The map on page 41 shows pipeline routes that would supply fracked gas to Kalama: 600 miles from British Columbia and 800 miles from Wyoming. How will pipeline construction impact land, water, agriculture, homes, and communities? Without any provision for mitigation, isn't this a giveaway of North American lands to a Chinese company?

With great humility, it is important to recognize that this entire project -- stretching across the northwestern U.S. and into Canada -- is on tribal lands. How will tribal communities be impacted? Have the tribes been consulted? Indigenous peoples have protected land and water for generations. Tribal "water protectors" continue to wage protests against usurpation of their tribal lands.

If the Dept. of Ecology approves this project, I fear that Ecology will be complicit in unmitigated and controversial construction outside its purview. If there are lawsuits, will the Dept. of Ecology have to expend scarce resources going to court?

For reasons of ethics, fairness, and land protections, the Dept. of Ecology should deny this project.

Jean Avery

During the recent hearings, there has been considerable discussion of the SSEIS and its statements and assumptions. I wish to point out three (3) items that I believe are false or misleading assumptions.

1. The SSEIS somehow assumes that Kalama is the best choice of a methanol supplier to China. However, the world map on page 48 shows other sources of methanol -- including two in SE Asia that are actually closer to China than Kalama (1,400 miles vs. 5,000 miles).

2. Recent news seems to undo NWIW's assumption that China will continue to prioritize coal for the next forty years. In a speech to the U.N. on September 23, 2020, President Xi announced that China would become carbon neutral by 2060. According to the Financial Times, "this could push coal demand in China close to zero." If China reduces coal consumption, then NWIW cannot assert that its methanol is less polluting than the (coal-based) alternative.

3. Some workers and unions welcome NWIW as a rare opportunity for jobs. However, clean-energy jobs are certain to increase in the coming years. Washington's own Governor Inslee paints an optimistic picture in his Freedom From Fossil Fuels Plan. He reminds us that increased investment in renewable energy will create more jobs, including skilled construction jobs. For Kalama and surroundings, this would be a BOTH-AND solution: clean-energy jobs AND pollution-free communities.

I urge the Dept. of Ecology to reject the NWIW project, which is risky and uncertain. Please take a longer view; a lot can change in forty years.

Mary Blumberg

How is a methanol plant in Kalama good for the environment? Will increased tanker traffic enhance the current salmon fishery? Will the light pollution from this plant interfere with migratory birds? Unfortunately salmon and birds don't pay taxes for the luxury of small town living, so they don't have a say.

This plant will do zero for the people who live in Kalama. As of now, extraneous light from the Port of Kalama interferes with enjoyment of a dark sky. There is also enough noise pollution in town from the current rail system and freeway. This plant will do nothing for the citizens of Washington.

China is allegedly our trade enemy, so why are we seating a plant on our fragile ecosystem? We know what environmental champions China is.

No doubt, this plant will be state of the art, blah, blah, blah until the unforeseeable catastrophic event happens, then who is left holding the bag? At least we can be happy knowing that we helped create more wall to wall carpeting at the expense of our river and our children's futures.

Kirk Leonard

As a long time resident of Kalama, I am opposed to Northwest Innovation Works' building the world's largest fracked gas to methanol refinery.

This project would be a disaster for this community and for the environment. The refinery would consume 5 million gallons of water and 320 million cubic feet of gas each day, with 80% of the water lost as steam and diesel particulate, ammonia, carbon dioxide and nitrogen dioxide released into the air.

The SSEIS shows the facility would generate 4.6 million tons of carbon pollution each year, making this proposed project one of the largest sources of climate pollution in Washington State.

Speculating this project may displace other fossil fuels is not justification for the known pollution that will harm the citizens and climate.

Please do not approve this permit.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

According to the website -https://opencorporates.com/companies/us_wa/603366951, you can see how many Northwest Innovation Works LLCs there are. There has already been a long history of dissolving some of its companies at the drop of a hat, even with the Chinese government and other significant investors backing it.

Before the Department of Ecology makes recommendations on mitigations, there needs to be something more substantial in place than a signature by one person.

Here are all of the Northwest Innovation Works LLCs

Northwest Innovation Works LLC. Company number 97963194
Nov 25th, 2013 to present

Northwest Innovation Works LLC. Company number 603479637
Feb 19th, 2015 to present

Northwest Innovation Works LLC. Company number 97962691
Nov 25th, 2013 to present

Northwest Innovation Works LLC. Company number 603366498
Jan 14th, 2014 to present

Northwest Innovation Works LLC. Company number 603366951
Jan 15th, 2014, Administratively Dissolved.

Northwest Innovation Works LLC. Company number 603366954
Jan 15th, 2014 Voluntarily Dissolved

Marion Ward

The most important crisis facing our planet is climate change caused by carbon pollution. It is imperative that carbon-producing sources be phased out throughout the world. The Kalama gas-to-methanol project would "phase-in" a huge carbon producing source. Fracking at the source produces methane, the refinery would produce millions of tons of carbon every year, and burning it overseas releases even more carbon. What happens one place effects the whole planetary system. Nothing happens in isolation. For the sake of my children and grandchildren, I implore you to deny the permit for Northwest Innovation Works.

Laurie Solomon

My name is Laurie Solomon. I have been going camping and fishing since I was old enough to walk and talk. I have been an acupuncturist in Clark County since 2001. I have never gone to China; I realized in the 90's that colleagues who go there for Chinese herbs, or to study with acupuncturists there, usually have upper respiratory tract problems for at least a month after they return. As a former cigarette smoker, I have never considered visiting the country where my career ostensibly originated; Throughout China, the skies are gray with Industrial Air Pollution, with Beijing reportedly filled with pay-phone like stations for people to get a few minutes of Oxygen in these booths, after depositing a few coins.

It is not a surprise that companies supported by the Chinese companies, are spending so much to convince citizens and regulators in this country to continue to supply their country with Fracked Gas. Fracked Gas is extremely harmful to the environment, along with pipelines, releasing greenhouse gases, fossil fuel spills and leaks, burning methanol as fuel in China, and the endless stream of single-use plastics.

Another consideration for me is the extreme amount of both Fracked Gas and Electricity predicted to be used by this Methanol Refinery! It seems obvious that the cost of these two commodities would go sky-high for Washington residents because we'd be competing with the Refinery for them! But many seem willing to destroy our peaceful, healthy environment, where fishing has already become less productive due to climate change, to allow transport of extracted gas through certain-to-leak pipelines passing through our state; to allow enormous amounts of Greenhouse Gas Emissions to pollute our state's air; and then to voluntarily pay more (due to high demand) for the Natural Gas, Water, and Electricity that we currently pay relatively little to use. It doesn't make any sense. And it seems very unlikely that China would give up some of its coal-powered refineries just because we in Washington decide to allow the construction of the biggest fracked-gas-to-methanol refinery in the world. There are currently wind-generating machines sitting unused in China because the conversion from coal to wind-power is too difficult for each municipality to justify building.

It is heart-breaking to realize that this proposed atrocity on the Mighty Columbia River is all about jobs, port rent receipts, tax revenue, high profits for a foreign developer, and, if truth-be-told, bribes behind-the-scenes. This is not the long-term vision needed for future generations. We, as a human species need to act now to save our planet. Subsidized fossil fuel extraction and usage is devastating this world. Now's the time to make the switch to green, renewable energy. Our state is supposed to be all about that! Cowlitz County's citizens could be put to work building light-rail or a high-speed magnetic-levitation train along the I-5 corridor from Portland to Seattle, for instance! Retraining to build solar power and use the existing pipelines to transport water are other examples of good jobs!

I hope that we can continue to count on Governor Inslee, who claims concern for the Climate Crisis, along with Laura Watson and her Department of Ecology Team, to lead the way by rejecting another Fossil Fuel Disaster. Neither Indigenous Peoples of Canada nor citizens of Kalama should be expected reside in "sacrifice zones."

Thank you for your consideration of my comment.

The proposed NWIW methanol refinery would cause millions of tons of greenhouse gas pollution each year, for 40 years. Ecology should deny the Shorelines permit for the refinery.

The SEIS relies on a flawed, speculative analysis to argue that methanol could “displace” dirtier energy.

Burning methanol as fuel would generate millions of tons of pollution each year.

Ecology’s analysis should focus squarely on the significant pollution impact of the proposed refinery, which is profoundly inconsistent with a low-carbon future.

Burning methanol as fuel would generate millions of tons of pollution each year.

Ecology’s analysis should focus squarely on the significant pollution impact of the proposed refinery, which is profoundly inconsistent with a low-carbon future.

Washington cannot contribute to the goal of keeping global warming “well below 2 degrees Celsius” by allowing major polluters to move forward. A low-carbon future demands investment in lower-emitting production processes.

Ecology should not assume that future energy needs must be met by fossil fuels.

The SEIS provides little detail on the actual mitigation that would be accomplished as part of the “voluntary” mitigation framework. The mitigation framework is too vague for Ecology to conclude that the project’s impacts can and will be mitigated.

Ecology should be requiring mitigation of the full impact of the Kalama refinery.

The SEIS continues to use low estimates of methane leakage.

The SEIS continues to rely on a narrow set of “bottom-up” estimates for its methane leakage estimates. The SEIS should instead evaluate methane leakage rates based on “top-down” observations.

The SEIS makes unreasonable assumptions about the potential source of fracked gas and its impacts.

The analysis fails to NWIW spent five years attempting to mislead Washington account for the long-term impact of plastics.

Derya Ruggles

With all due respect, I am astonished we are even considering this dangerous, damaging and antithetical to all reason and science proposal!

The proposed NWIW methanol refinery would cause millions of tons of greenhouse gas pollution each year, for 40 years.

Ecology should deny the Shorelines permit for the refinery.

It's Time to Pursue a Truly Low-Carbon Future. Please do not put profits over people and sell-out our healthy future. How much more science and protestation from the people do we need to wake up? Deny this monster before it becomes a nightmare we all cannot wake from. Thank you so much. Sincerely, Derya Ruggles, very concerned community member

I have grave concerns about the proposed Kalama Manufacturing and Marine Export Facility. At a time when we are experiencing the harmful effects of climate change it is imperative that we support facilities that promote a healthier environment instead of degrading it. Greenhouse gas emissions from the pipeline bringing in the natural gas, the production and storage of the methanol and the end product of plastic ingredients all are detrimental to the environment and climate.

Washington state should be a leader in supporting projects that are beneficial to climate change and our health not destructive ones. For the health of our citizens and our world I urge you not to approve building this facility at Kalama or anywhere else.

Sincerely,

Marian Hayes

Denise Lytle

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Diane Dick

Washington State Department of Ecology
Olympia, Washington

Re: Formal Comments on Kalama Manufacturing and Marine Export Facility Draft Second Supplemental Environmental Impact Statement, September 2020

Please deny Kalama Manufacturing and Marine Export Facility (KMMEF) a shoreline substantial development and a conditional use permit. The environmental impacts from the project are significant and cannot be mitigated.

Greenhouse gas emissions are insufficiently explained in the draft second supplemental environmental impact statement (SSEIS) and the data contains errors and omissions.

From information in the air discharge permit this refinery has the capacity to emit over 1 million metric tons of GHGs every year just on the process site.

While this is the least amount of GHGs the refinery will emit, can even 1 million metric tons be mitigated?

NWIW states they will mitigate all in-state emissions. Priority will be given to projects in Cowlitz County. PLEASE - require specific examples of mitigation projects and their verifiable ability to remove greenhouse gases from the atmosphere.

The only viable way to remove CO2 from the atmosphere that I am aware of is by growing trees or crops. According to the EPA greenhouse gas calculator it would take 1,306,000 acres of average forest land to remove 1 million tons of GHG in a year.

Cowlitz may be a large county but it only comprises about 746,000 acres. There is no way on God's green earth NWIW will be able to mitigate a fraction of its total emissions in projects in Cowlitz County or all of Southwest Washington.

Demand accountability for a realistic mitigation plan now because you surely will not get voluntary compliance later. Do not let NWIW be one more company that tries to buy its way out of fouling our environment and turns up the heat on climate change.

Deny shoreline permits for NWIW.

Thank you.

Diane L. Dick
Longview, WA

Jovohn Hornbuckle

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Miriam Margulies

The proposed NWIW methanol refinery would cause millions of tons of greenhouse gas pollution each year, for 40 years. Ecology should deny the Shorelines permit for the refinery. Ecology's analysis demonstrated that the project would produce 4.6 million tons of carbon pollution each year, or more. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C.

The SEIS relies on a flawed, speculative analysis to argue that methanol could "displace" dirtier energy. The SEIS speculates on how methanol may compare with future, unsure, alternate sources of pollution in overseas markets. The SEIS makes a false and erroneous comparison with potential future other sources of methanol or olefin production. Rather than engaging in this speculation, Ecology should focus on the real-world, known pollution that will come from the facility rather than NWIW's dubious "displacement" argument.

Burning methanol as fuel would generate millions of tons of pollution each year. In 2018 and 2019, NWIW informed potential investors that methanol from the planned refinery could be burned as fuel overseas, in sharp contrast to claims NWIW made to local and state regulators that the methanol would only be used to manufacture plastic. Now, Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year. Combustion of the full methanol production capacity of the plant would generate 5 million tons of pollution each year.

The Proposed Facility would be devastating to public health

1. Fracking pollutes water systems, and causes physical harm from earthquakes and the devastation of surrounding habitat.
2. The pipeline required to transport fracked gas has a high risk potential for leakage and spills, releasing harmful chemicals into ground and surface water.
3. On-site operation of the facility would pollute the Columbia River and its tributaries with harmful runoff, and contribute to reduced air quality leading to increase instance of asthma and other respiratory illness.

We are in the midst of a global climate crisis, and it is time to stop all fossil fuel expansion.

Comments on the Kalama Manufacturing and Marine Export Facility Second Supplemental EIS
from Linda Craig
2433 NW Quimby St.
Portland, OR 97210

The conclusion of the SSEIS that the project would not result in significant adverse impacts to GHG emissions or climate change is deeply flawed. The conclusion is reached not because operations of the plant will not result in significant GHG emissions, but because the plant will displace other, dirtier sources of GHG in the future. The reasoning is faulty.

I speak from experience. In the 1970's, I worked for the Pacific Northwest Regional Commission which was a federal/state partnership to fund economic development in the region. At the request of the utilities, we commissioned a study by a notable team of expert economists to look at the need for electrical power in the future. They found, based on their well-reviewed economic modeling, that the region's need for power would double every 10 years. Five new nuclear power plants were planned to meet the anticipated demand. Construction began. The modeling was seriously wrong. It did not anticipate that energy conservation would be a much less expensive source of power. Growth in electrical demand was not even close to what was modeled. The project resulted in the **largest municipal bond default** in history. It cost ratepayers thousands of dollars and 75,000 bondholders lost money. This is the story of the Washington Public Power Supply System (WPPSS, pronounced Whoops!, <https://www.historylink.org/File/5482>).

This EIS finds that the project will not result in adverse impacts because it will displace dirtier sources for olefins. This is another Whoops!, a conclusion drawn from economic modeling based on assumptions that could be grossly wrong. The economic models resulting in this conclusion make projections based on today's assumptions without anticipating changes that are bound to happen as new technology is developed and new public policy is set.

We don't know enough to know what GHGs, if any, will be displaced by this project. The adverse impact of this project and its GHG emissions must be based on the project's operations alone, not on what it might hypothetically displace.

I will leave it to people with more expertise than I have to comment on whether the direct emissions from this project are fairly measured. The FEIS says that they will be substantial. We who live in the PNW, having just lived through the worst air quality in the world due to fires, which are partially due to climate change, should not build giant projects which will damage the region and the planet for the next 40 years.

I urge you to choose the No Action alternative.

Emanuel Jacobowitz

As a Washington resident and a member of the Faith Action Network and Plant for the Planet, I write to urge the Department not to approve the proposed methanol refinery in Kalama. The Department's SSEIS indicates that Northwest Innovation Works promises to mitigate the significant in-state carbon emissions associated with the facility. Respectfully, such promises are far more often made than delivered, and once begun, a project like this becomes politically far harder to end even if conditions are not fulfilled.

Furthermore, mitigating in-state impact is simply not good enough. The Department must be aware of the strong, high-universal consensus among climate scientists that the world is teetering on a precipice caused by too much carbon dioxide and methane emission. Washington has a responsibility to--at the very least--not add to the problem. We are supposedly a climate leader. Time to live up to that image.

Similarly, the promise that the refined methanol will not be used as fuel, only in plastics production, is ludicrous. Northwest Innovation cannot possibly guarantee that, nor can Washington enforce it.

Lastly, the SSEIS offers the tired old excuse: "if we didn't do it then someone else would," and maybe that person would do it worse. We cannot predict what some hypothetical other person might do. We can, however, control what we ourselves do. We should avoid doing harm.

Furthermore, the argument is, bluntly, stupid. Filling a demand does not sate demand. It enhances demand. If we supply more methanol, that will simply lead to increased investment in and reliance upon methanol products, leading to more methanol production elsewhere, by those same hypothetically less careful producers.

Please stop this dangerous project.

Thomas Gordon

2060 is when Xi wants China to be carbon neutral 40 years from now which is the supposed life-time of the Kalama methanol plant.

Meanwhile, NWIW is trying to get the U.S. to loan \$2 billion dollars to build this refinery.

So in 2060, does China shut the plant down and say goodbye? Leaving us the clean-up, useless equipment, depleted resources, a lot of polluted land, and haze in the air? And debt.

Please do not issue permits for this monstrosity for all except NWIW and China.

Thank you.

gunnar sievert

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this projects impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washingtons climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Patricia Warden

The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Amy Hansen

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

David Malcolm

I oppose the Kalama methanol project mainly because the natural gas used comes from fracking which is a highly polluting and dangerous process.

Tracy Cole

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. SUBJECT: Review of the KMMEF SSEIS

My name is Mark Uhart and my wife and I live near Kalama. I certainly hope Ecology will read all the written comments, and scrutinize the information in this SSEIS. I read the SSEIS and there are so many bad assumptions, poor application of technical information, and a covert attempt to under report upstream, operational and downstream emissions. I documented my review and I am submitting multiple comments, referencing all my sources.

1. The SSEIS refers to the research by Yu Gan, et al (2020), as referenced in Section 3.4.4.2.1 of the SSEIS (China-based natural gas to methanol), "... the average GHG intensity of the Chinese domestic natural gas supplies is 15.5 grams CO₂eq per megajoule (g CO₂eq/MJ) for conventional methods and 21.5 g CO₂eq/MJ for unconventional methods." It goes on to state, "the average GHG intensity for these supplies is 35.9 g CO₂e/MJ for international pipelines," which is a primary source for Chinese natural gas from Russia. Furthermore, the SSEIS goes on to state that based on the Gan study, both domestic and imported sources of China based natural gas have a higher GHG intensity than US-based sources, which average 12.1 g CO₂e/MJ (Table B.5, Appendix B, First SEIS.)

The Gan study states that the GHG intensities of the 104 shale gas fields, identified in his research, show the range is from 6.2 to 43.3 g/CO₂eq/MJ⁻¹. Due to increasing shares of GHG-intensive supplies from Russia, Central Asia, and domestic shale gas fields, the supply-energy-weighted average GHG intensity of China natural gas is projected to increase from 21.7 in 2016 to 23.3 g CO₂eq/MJ⁻¹ in 2030. Unconventional/natural gas has a higher supply-energy-weighted average GHG intensity of 21.4 g CO₂eq MJ⁻¹, primarily driven by extraction-associated emissions. The average extraction-associated GHG emissions of China shale gas was estimated at 19.1 g/CO₂eq/MJ⁻¹. Gas extraction accounts for upward of 60% of the total GHG intensity of the supply chain. Figure Fig. 4, Well-to-city-gate GHG intensity supply curve of natural gas for China in 2030, in the Gan paper, illustrates extraction accounts for around 75%, with processing from 5-10% and transmission 5-15% (Gan et al.)

With all types of GHGs (i.e., CO₂, CH₄, N₂O) converted to GWP₁₀₀, methane leakages constitute approximately 50-70% of extraction-associated emissions for tight and shale gas. Because methane GWP₂₀ is ~3 times the GWP₁₀₀ the extraction-associated GHG emissions of unconventional gas increase significantly for GWP₂₀ compared to GWP₁₀₀. I know the SSEIS uses the AR4 GWP₁₀₀ calculations in Table

3.5-12 Upstream Emissions from Natural Gas because that is the WAC 173-441-120. The RCW will likely be updated to AR-5 and the GWP₂₀ factor for Methane will be used, thus vastly increasing the GHGs to be reported.

Furthermore, the SSEIS only mitigates GHG emissions within Washington State. This approach doesn't account for the global warming potential of methane over the next 20 years from "well to wheel," a standard more countries are using. Certainly within the 40-year life span of this project Washington's RCWs will change to move more in line other states like California, which includes methane emissions from extraction, processing, storage and transport as well as all the GHGs resulting from the methane being consumed as a fuel, the well-to-wheel approach. Methane leakage during transport over approximately 1,500 miles of pipeline from Ft. St. John to Sumas, to Kalama, should be attributed to this project. GHG emissions from transmission increase as the length of the pipeline delivering the natural gas increases (Gan, et al. 2020.) Was the length of the pipeline delivering natural gas from the fields on BC to the lateral pipeline included in the lifecycle analysis? Although it is stated that the GHG emissions from transmission of natural gas from BC to the lateral pipeline would be included, this was not stated in subsequent Table 3.5-14, whereas upstream GHGs were only calculated for the in-state transmission of the natural gas.

A high proportion of impurities in raw gas (e.g., CO₂, H₂S.) would necessitate intensive energy consumption for gas processing. The CO₂ content, which itself is a GHG, is vented after separation and further increases emissions (Gan et.al. 2020.) Other factors influencing extraction-associated emissions include the estimated ultimate recovery rate (EUR) per well, which is unknown for the BC-sourced natural gas. The supply-energy-weighted average GHG intensity of 2030 is projected to be 23.3 g CO₂eq MJ⁻¹. Johnson Matthey, the supplier of the ULE/GHR + ATR process, discussed later, estimates that a minimum level import of electricity, and a North American Mix, would result in 33.6 g CO₂eq MJ⁻¹ for the ULE/GHR + ATR process, much higher than NWIW's estimate.

2. The SSEIS states, "Thus, based on this study, both domestic and imported sources of China based natural gas have a higher GHG intensity than US-based sources, which average 12.1 g CO₂e/MJ (Table B.5, Appendix B, First SEIS). The problem with this statement is that it refers to Table B.5 in the First SEIS, which was (1) based on the GREET_2017 model, (2) assumed the AR4 100-year global warming potential (GWP) vs. 20-year, and (3) didn't include transmission leakage estimates along the 1,500 plus mile

pipeline from Ft. St. John, BC, to the BC-US border at Suma, WA, and on to Kalama, WA.

3. Section 3.4.4.2.2.1 states, "Due to the high uncertainty, the evaluation of upstream GHG emissions for non-KMMEF importers of methanol assumes that their upstream emission is equivalent to the upstream KMMEF emissions on a per MT of methanol produced basis." This is a bad assumption and contradicts other information in the SSEIS. Yu Gan stated that was why he researched the "Carbon Footprint of Natural Gas Supplies to China (Gan et al. 2020,)" to determine the GHG emission intensities of various Asian feedstock inventories supplying China.
4. In Section 3.4.4.2.2.3 Direct Emissions, it is stated the Ultra-Low Emissions (ULE) process will be used instead of the EPA-PSD-permitted combined reforming (CR) process. The actual emissions from the ULE process are unknown. The term "Ultra-Low Emissions (ULE)" is not used in any EPA permits for the use of this technology in the US. The ULE proposed by NWIW uses gas-heated reforming (GHR) + autothermal reforming (ATR), as described by Johnson Matthey (JM). Johnson Matthey's reforming technology is currently being used in Coogee Energy Pty. Ltd.'s small (50,000 mt/yr) gas-to-methanol plant in Laverton, Australia. It was built by BHP Petroleum in 1994. (Methanex, Canadian-owned methanol supplier, is building a GHR + ATR methanol plant in Louisiana.) Has NWIW completed an application for a Prevention of Significant Deterioration (PSD) Permit for GHG emissions to the EPA for the ULE process? What devices or equipment are subject to this PSD GHG permit (reformers, combustion units, boilers, catalytic reduction systems, regeneration heaters, treaters, flares, fugitives processors, pumps, cooling towers, etc.) What are the risks in approving ULE for this project without an approved PSD permit? What if NWIW, or its successor, decides to change to the CR process if the price of electricity makes ULE no longer cost-effective?
5. In Section 3.4.4.2.2.3 Direct Emissions, it is stated, "as described in Appendix B of the First SEIS, it is assumed that the ULE technology provides a 38% reduction in CO₂e emissions relative to combined reforming (process.) However, this author found an article from Oil and Gas Industry News, March 30, 2016 by Marshall Frank (writes for the Methanol Institute), that ULE technology requires additional on-site electric power generation to satisfy the overall energy requirements of the methanol plant. Adding the emissions from the required electric generation facility to its process emissions, ULE still offers a 31.4% reduction in total

emissions. Unless the author of the SSEIS can validate the 38% figure then the lower figure, 31.4%, should be applied.

Based on Johnson Matthey Technical Review 61 (Alan Ingram, 2017), which is attached to the end of these comments, the amount of GHGs, expressed as $\text{gCO}_2\text{e MJ}^{-1}$ methanol, is actually greater for GHR + ATR unless a maximum electrical import is used. If a maximum electrical import is used the difference is only about 12%. The only way this plant will see the efficiency stated in the FSEIS would be if they were using maximum electrical import and the electricity is from renewable resources. Ecology should check the data presented in Section 3.5.3.7. of the SSEIS against this JM Technical Review.

6. Section 3.4.5 Economic Analysis, the framework of the analysis was based on: a market analysis if the methanol was used as a fuel; how assumptions about the sources of methanol used influence the emissions analysis; and if the analysis of global GHG emissions can be more flexible based on a wider range of assumptions?
7. The SSEIS still fails to address the potential negative economic impacts from a "business as usual" approach to climate change. Without 100% sequestration of the GHGs for which this project will be responsible, it will contribute to the GHGs that affect climate change. What will be the economic impact to the state of Washington for the following:
 - o Fighting wildfires?
What will be the firefighting and disaster relief costs to the state and those affected by the fires?
 - o Lost timber harvests as a result of wildfires?
How many logging truck drivers, lumber mill and lumber exporting employees will lose their jobs?
 - o Decreasing timber harvests as a result of hotter and drier weather?
How will the lower timber yields affect jobs and revenue from state lands?
 - o Loss of commercial fishing revenue, directly and indirectly, as a result of decreasing salmon, steelhead and shellfish harvests?
How will this affect the fisherman, the processors, resellers, merchants, and state tax revenue?
 - o State and Federal disaster monies committed due to extreme weather events and fishery disasters?
How will this affect the state budget? Higher taxes?
 - o Repairs to public roads and utilities as a result of extreme weather events?
How will this affect our state budget?

Higher taxes?

- o Loss of productivity from extreme weather events?

Why wasn't there an attempt to quantify these costs?

- o Effects on human health?

What are the costs associated with extreme weather events and more air and water pollution.

- o Increased healthcare costs?

Who will bear the healthcare costs from the additional PM2.5 in the air?

8. In Section 3.5.3.1 the SSEIS states, "The ESM recognizes that limitations likely will be placed on coal-based methanol expansion in China in the future. Over time, the ESM predicts an increase in natural gas-based imports to fulfill the methanol demand in China under the alternate cases. This is why the average annual emission values are lower than the initial year values (2020), because over time substitution for coal is slowly reduced, and RC emissions decline." This statement discounts the projected growth in the methanol industry. (See Figure 3.5-8 and Section 3.4.5.3, where it states, "The methanol market is forecast to continue growing, having experienced an average annual growth rate of 4.5 percent per year between 2015 and 2020,... according to the methanol institute.) RC emissions will not decline, they will continue to go up as more methanol plants come online, as projected in this SSEIS.

This author disagrees with some of the assumptions presented in Section 3.5.3.1. For example: "60 percent of the methanol produced by KMMEF is assumed to be used for olefin production, and 40 percent is assumed to be used for fuel production." The demand for methanol as a fuel is likely to be more because the production of olephin from conventional gas is a less expensive pathway. China's growing fleet of commuter vehicles and methanol-powered ships indicate it is more likely than not that methanol will be used as a fuel.

9. The assumption developed in Section 3.4.5.2, and illustrated in Table 3.4-3, Source Definition Under Three Alternate Cases, are questionable. As shown in the table presented by Yu Gan (2020), on the next page, imports from natural gas pipelines outside of China will increase. The new pipeline from Russia will deliver 12.6% of energy supply by 2030. This author questions the statement, "The RC/best estimate was designed to illustrate the most likely outcome, wherein 60 percent of the production that would come from the KMMEF would potentially be replaced by production from coal-based methanol in China (CCM), 10 percent would be from

natural gas-based methanol from China (CNGM), and 30 percent would come from imports.” Based on Gan’s research, and the fact that China’s growing need for electricity cannot be met with only natural gas and renewable energy, the coal-fired plants will continue to operate. In fact, China continues to build more coal-fired plants based on their 14th 5-year plan (2021-2025.)

Category	Country	Gas fields ^a	% of supply energy ^b

Total			96.3	94.5	89.4

^aNumbers in parentheses correspond to the gas field numbers in Fig. 1. ^bDetailed shares of supply from individual gas fields and data sources are presented in Supplementary Data 1. ^c— means no gas supply to China for the gas fields in 2016, and the fields are expected to start gas delivery later than 2016. ^dAPLNG fields are gas fields of the Australia Pacific LNG project, which include fields of Spring Gully, Talings, Combabula, Condabri, Peat, Orana, Reedy Creek, Jordan, Ruby Jo, Kenya, Bellevue, Fairview, Arcadia, Roma East, and Ironbark in the Surat and Bowen basin of Queensland Australia. ^eQCLNG fields are gas fields of the Queensland Curtis LNG project, which include fields of Bellevue, Berwyndale, Charlie, Jordan, Kenya, Ruby Jo, and Woleebee Creek.

10. At the end of Section 3.4.5. it the SSEIS states, “Because methanol will increasingly replace higher-emission transportation fuels such as gasoline and bunker fuel for ships, it is likely that the increases in methanol production through time will also result in lower global emissions when compared with a future scenario that excludes methanol-based fuels.” This might be true if the world population doesn’t increase, but we know it will, thus driving the need to consume fossil fuels. It is more likely than not that there will be increased demand for all fossil fuel energy feed stocks.

- "Low natural gas prices are presumed to persist in North America." What does "persist" mean? I agree that a price will a price, any price, will persist. But if this means the "low" natural gas pricing will persist then I don't agree. The higher demand for natural gas in SW Washington, as a result of the new KMMEF, could increase natural gas prices. What is the capacity of the Williams pipeline and how will it factor into the cost?
- "Oil prices are assumed to remain stable at present levels - about \$40/barrel." Again, this might be a good assumption for the short-term, but prices will rise when demand goes back up and the supply goes down.
- "The upstream methane emission rate is 0.97 percent for KMMEF." This is shown in Table 3.4-1b for the "Medium" scenario. The SEIS also states in footnote 3. of Table 3.5-14, "Upstream natural gas emissions in Washington State calculated by multiplying the transmission emissions from GHGenius or GREET (depending on scenario) by the fraction of the total pipeline miles from the natural gas source region that are within Washington State.

The 0.97 percent is very low based on this author's research (Atherton, Risk et al. 2017, Zavala-Araiza, et al. 2018, Alvarez, et al. 2018, Howarth, 2019, Burnham 2019, and Gan, et al. 2020.) After reviewing the GREET 2019 table, this author believes the "Upper" scenario is the best for this facility based on the operating conditions and the author's review of many studies on upstream fugitive methane (production, processing, and distribution). The leakage rate should be between 2.5% and 3.1% of the amount of natural gas consumed. As part of that the leakage rate during transmission must include transportation from processing facilities in BC at Ft. St. John, to the BC-WA border at Sumas, to the KMMEF lateral pipeline, not just "within Washington State." This is approximately 1,500 pipeline miles.

11. The "Net Emissions" for the KMMEF shown in Table 3.5-10, and discussed in Section 3.5.3, should not be considered in the decision on the shoreline permit. It is not relevant as it is based solely on the displacement theory, and the assumption that most of the methanol will be used for the production of olefins, which is unlikely, cannot be assured and validated throughout the 40-year life of this project.

Reducing the Carbon Intensity of Methanol for Use as a Transport Fuel

Impact of technology choice on greenhouse gas emissions when producing methanol from natural gas

Alan Ingham

Johnson Matthey, 10 Eastbourne Terrace,
London W2 6LG, UK

Email: alan.ingham@matthey.com

Methanol is increasingly being looked at as a way to reduce the emissions potential of transport fuel. It may be used in place or in addition to gasoline fuel, for example. The amount of greenhouse gas (GHG) emitted in producing methanol can vary hugely according to the syngas generation technology selected and the choice of electrical or steam turbine drive for compressors and pumps. This paper looks at the impact of these technology choices on GHG emissions and how the carbon intensity of methanol used as a transport fuel compares to the carbon intensity of other hydrocarbon fuels. It is found that methanol produces lower well to wheel emissions than gasoline under all production methods studied and can even produce lower GHG emissions compared to ethanol as a fuel supplement. However, the same is not always true if methanol is used to produce gasoline from natural gas.

1. Introduction

Many countries around the world are either using or looking to use methanol as a fuel. China is currently leading the way and in 2015 used as much as 12 million metric tonnes of methanol to fuel its cars, trucks and buses. Methanol now makes up 8% of the Chinese fuel pool and in over a dozen provinces fuel blends such as M15 (15% methanol and 85% gasoline) are sold for

use in existing passenger cars (1). Methanol is an affordable alternative transportation fuel due to its efficient combustion, ease of distribution and wide availability around the globe. Methanol is a high octane fuel that enables very efficient and powerful performance in spark ignition engines.

Engines optimised for methanol could provide an energy based efficiency gain of 50% over a standard (port fuel injected, non-turbo) gasoline engine in a light-duty vehicle (2).

Two different methods are used to compare the emissions from the flowsheets, the first is the direct GHG emissions from the methanol plant as a carbon dioxide flowrate per hour and the second is the carbon intensity of producing methanol based on the total carbon emitted from the process per unit of energy, and is expressed as grams of CO₂ equivalent per megajoule of methanol on a lower heating value (LHV) basis (gCO₂e MJ⁻¹ MeOH).

2. Natural Gas to Methanol Flowsheets

To produce methanol from natural gas, the natural gas must first be reformed to syngas before converting this syngas to methanol, further details of the Johnson Matthey reforming options can be found elsewhere (3). In order to generate a syngas with the correct stoichiometry for methanol production there are four main process flowsheets for reforming the natural gas:

1. steam-methane reforming (SMR)
2. SMR with maximum CO₂ addition (SMR + CO₂)
3. combined reforming (CR), with SMR and autothermal reforming (ATR)
4. gas heated reforming (GHR) and ATR (GHR + ATR).

Each of the reforming options listed above has advantages and the choice of flowsheet depends on a number of parameters, with the most influential being the natural gas composition, operating cost and capital cost. There are several other factors that also have a significant influence when assessing the benefits of each process and the **environmental impact of the plant is becoming increasingly more important**. This is most noticeable in North America where the cheap natural gas price has led to numerous **methanol projects being developed, all of which require a Title V environmental permit before construction can begin (4)**.

Figure 1 is an overview of the flow of carbon and the emission points from the methanol plant for Flowsheets **1** to **3**. **Figure 2** shows the same overview but for Flowsheet **4**, the GHR + ATR flowsheet, which due to the nature of the reforming section has a different layout.

Using a typical North American pipeline natural gas composition from a recent methanol project in the USA, a comparison of the natural gas efficiency, electrical power consumption and CO₂ emissions for the four flowsheets is shown in **Table I** based on a capacity of 5000 mtpd. These flowsheets are based on driving all compressors and large pumps with steam driven turbines and utilising import electricity to drive the air cooler fans and smaller pumps only. This is the minimal electrical import to the inside battery limit (ISBL) plant without the addition of a turbo generator, where the ISBL plant refers to the methanol unit only and does not

include utilities other than the air separation unit (ASU), where applicable. The natural gas efficiency, on a LHV basis, has been split out to show where the natural gas is used within the ISBL plant and is quoted on a per tonne of methanol basis.

As an alternative flowsheet option, it is also possible to minimise the amount of natural gas burnt in the auxiliary boiler by maximising the number of compressors that are driven by motors, allowing an improvement in the natural gas efficiency of the ISBL plant as well as reducing the CO₂ emissions. **The values in Table II are based on maximising the import electricity while maintaining the minimum load on the auxiliary boiler.**

Two important trends are displayed in **Tables I** and **II**. The first is that the CO₂ emissions in **Table I** move in line with the natural gas efficiency of the flowsheet, with the exception of the SMR + CO₂ flowsheet. This stands to reason because, as **Figures 1** and **2** show, again with the exception of the SMR + CO₂ flowsheet, **natural gas is the only carbon input into the ISBL plant, with methanol and CO₂ emissions the only output. Therefore, any carbon in the natural gas not converted to methanol will eventually leave the plant as CO₂.** The SMR + CO₂ flowsheet is the exception to this rule as additional carbon is added to the process in the form of CO₂ injected upstream of the reformer. This additional carbon helps improve the natural gas efficiency but at the expense of increasing the CO₂ emissions from the ISBL plant. The increase in CO₂ emissions for the SMR + CO₂ flowsheet is due

to both the increase in natural gas fuel required in the reformer because of the reduced LHV of the methanol loop purge gas as well as an increase in CO₂ concentration in the recycled fuel from the methanol loop and distillation. Therefore, with any CO₂ injection flowsheet aside, the better the natural gas efficiency of the ISBL plant the lower the CO₂ emissions. If captured CO₂ is used as a feedstock to the ISBL plant for CO₂ injection flowsheets then **Tables I** and **II** show that the net CO₂ emissions fall back in line with this trend.

The second important trend is that as the comparison between **Tables I** and **II** shows, for the SMR, SMR + CO₂ and CR flowsheets there is no significant scope to maximise the electrical import while maintaining the minimum auxiliary boiler load. The SMR, SMR + CO₂ and CR flowsheets all generate high pressure (HP) steam as a way of cooling the process gas after reforming. This steam is a useful byproduct of the cooling process because it can be used to power the turbines of the large compressors on the plant. In addition, all flowsheets have an auxiliary boiler, whose primary purpose is for start-up and shut-down. In normal operation the boiler is kept running but it has a minimum turndown and so this steam also has to be utilised within the ISBL plant. After all this steam has been consumed, the additional power requirements of the smaller compressors are minimal and hence there is no real benefit in switching from steam turbine driven to motor driven compressors for reducing the ISBL plant emissions and improving the natural gas efficiency. In contrast, the GHR + ATR flowsheet uses the high temperature process gas to provide heat for the reforming reaction in the GHR, which then allows all the compressors and large pumps to be electrically driven if required. The ability to decouple the power requirement for the compressors and large pumps from the ISBL plant, and the fact that the GHR + ATR flowsheet does not contain a SMR, means that the CO₂ emissions of the ISBL plant can be reduced significantly for normal operation, as shown in **Table II**.

3. Gas Heating Reforming and Autothermal Reforming Flowsheet

To understand why the GHR + ATR flowsheet allows for increased flexibility in choosing the power to drive the rotating equipment, a more detailed description of the flowsheet is given below.

The GHR + ATR flowsheet incorporates a GHR in series with an ATR, with an interchanger on the feed to the GHR, as shown in **Figure 3**.

The GHR consists of a refractory lined vessel containing vertically supported tubes filled with nickel catalyst. The feed gas is preheated by the GHR shell-side effluent gas before it passes down through the tubes where the endothermic reforming reaction takes place (Equations (i)–(iii)).

The heat required to drive the reaction is provided by reformed gas from the ATR which flows counter-currently on the shell-side of the reactor. The partially reformed gas leaves the tube-side of the GHR at approximately 700°C.

The product from the GHR is fed to the ATR, which is also a refractory lined vessel. Oxygen is fed to the burner gun of the ATR and this then mixes with the hydrocarbon feed and burns in the upper section of the ATR. In the middle section the hot gas passes over a fixed catalyst bed, where the temperature drops as the endothermic reactions proceed.

Sufficient oxygen is fed to produce a temperature exiting the catalyst bed of 1020°C and at these conditions the reformed gas contains low levels of methane slippage. The hot reformed gas from the exit of the ATR passes to the shell-side of the GHR where it flows counter-currently to the tubes and

Fig. 3. GHR + ATR flowsheet arrangement

provides sufficient heat for the reforming reaction in the GHR tubes. The reformed gas, now known as synthesis gas (syngas), exits the shell-side of the GHR and passes to the interchanger where it preheats the incoming feed gas. The syngas exits the interchanger then passes to the downstream heat recovery.

No steam generation is required as all the high grade process heat is recycled directly back into the process which provides the ability to decouple the power requirement for the GHR + ATR flowsheet and move it outside battery limits (OSBL). This is an effective method of reducing the emissions and improving the natural gas efficiency of the ISBL plant. However, typically the imported power to the plant will be from the grid, where the electricity is generated from a portfolio of technologies, with the largest contribution generally from fossil fuels burnt in a power plant. A typical North American portfolio of grid electricity is shown in **Figure 4** and this shows that 68% of the electricity is generated through burning carbon fuels.

The imported power means that the source of the CO₂ emissions generated by producing the electrical power is transferred from the ISBL plant to the existing producers, so essentially the emissions are just being moved from one location to another. When building a new methanol plant, this is advantageous as the emissions required for the Title V environmental permit in the USA are only those for the new plant and do not include those for the existing producers supplying the import electricity. Therefore, in areas where GHG emissions are restricted, the GHR + ATR flowsheet with imported power offers the best flowsheet for

Fig. 4. A typical North American electricity mix (5)

reducing GHG emissions for the ISBL plant and also for providing a natural gas efficient flowsheet.

Importing electricity allows the ISBL emissions to be reduced but it doesn't give a complete representation of the carbon intensity of producing methanol using the GHR + ATR process. For certain states in the USA and Canada, for example California, there has been a drive to reduce the carbon intensity of the fuels they use and this has resulted in the implementation of legislation in California called the low carbon fuel standard (LCFS), a summary of which is given in **Appendix A**. This standard looks at the total carbon emissions of a fuel from well to wheels and so tries to capture the total carbon intensity of that fuel over its whole life cycle. So taking gasoline as an example, the LCFS aims to take into account the GHG emissions during the extraction and refining of the crude oil, transporting the gasoline to the pump as well as the emissions from the combustion engine in the vehicle. In order to enable the carbon intensity of these fuels to be determined from well to wheels, software has been developed to calculate the GHG emissions over the whole life cycle of the fuel. This software can therefore also be used to determine the carbon intensity of producing methanol on a well to product basis, thus incorporating the GHG emissions from transporting the natural gas to the plant, the electricity used in the plant and from storing the methanol.

4. The Greenhouse Gases, Regulated Emissions and Energy Use in Transportation (GREET) Model

GREET is the software developed by Argonne National Laboratory, USA, in conjunction with the Californian government's LCFS to enable the calculation of GHG emissions for fuels produced and imported into the state of California (6). The software uses pathways to break each step of the product life cycle down and enables the emissions from each section of that process to be determined.

Using the GREET software, the figures generated below in **Tables III** and **IV** show the well to product values for the four flowsheets based on steam driven turbines for the compressors and large pumps, as **Table I**. The first section of the table is divided into three parts for the GHG emissions. The first is the processing and transportation of natural gas from the well to the methanol plant, the second is the emissions from the ISBL plant and the third is the storage of the methanol. The second section shows the GHG emissions for the

Table III GREET Numbers for Minimum Electrical Import^a

Stage	Units	SMR	SMR + CO ₂	CR	GHR + ATR

^bThe net CO₂ GREET GHG emissions are shown in brackets

distributed electricity to the ISBL plant. There are two figures relating to the import electricity: the first is based on the standard North American electricity mix, as shown in **Figure 4**, and the second is based on a standard renewable energy electricity mix, as shown in **Figure 5**.

As **Figure 6** shows, the USA and China are leading the way in the installation of renewable energy and therefore being able to use electricity where the majority or all of the energy comes from a renewable source is a distinct possibility in the near future. This real possibility of access to electricity from a renewable source is why this option has been considered. In addition, it also gives a good

indication of the total possible reduction in carbon intensity of producing methanol.

The units for the values in **Tables III** and **IV** are grams of CO₂ equivalent per megajoule of methanol on a LHV basis (gCO₂e MJ⁻¹ MeOH).

The GREET GHG emission values in **Table III**, for flowsheets with the minimum electrical import, follow the same trend as the CO₂ emissions in **Table I**. This is because for the minimum electrical import flowsheets the contribution to the GHG emissions from the import electrical power is minimal and so the total emission figures are dominated by the emissions from transporting the natural gas to the ISBL plant and from the ISBL plant itself.

Fig. 5. Standard renewable energy mix (7)

However, the GREET GHG emission values in **Table IV**, for flowsheets with the maximum electrical import, show a different trend. For the SMR, SMR + CO₂ and CR flowsheets, moving to the maximum electrical import actually increases the overall well to product GHG emissions compared to the values in **Table III** when using the typical North American electricity mix and only a small reduction when using the renewable electricity mix. This is compared to the GHR + ATR flowsheet which shows a reduction in GHG emissions of 15% and 54% when using the typical North American electricity mix and the renewable electricity mix respectively. The reason for the increase in GHG emissions for

the SMR, SMR + CO₂ and CR flowsheets when using the typical North American electricity mix compared to a reduction in emissions for the GHR + ATR flowsheet centres around the plant heat integration and utilisation of the steam from the auxiliary boiler. For the SMR, SMR + CO₂ and CR flowsheets the generation of HP steam in the reformed gas cooling train means that there is only sufficient heat remaining in the reformed gas to provide approximately 55% of the distillation duty, with the remaining duty provided by low pressure (LP) steam. There is therefore a large LP steam demand, which typically has been satisfied by using medium pressure (MP) steam in back pressure turbines, with the LP steam header topped up by letting down a small amount of MP steam. This therefore maximises the amount of work performed by the MP steam. When, however, the compressors driven by these turbines are switched to motor driven, the LP steam demand remains the same and so the shortfall in LP steam is made up by letting down more of the MP steam. This then results in the use of MP steam becoming less efficient and so the GHG emissions for the combined ISBL plant and import electricity actually increase. For the GHR + ATR flowsheet, the LP steam demand is small because all the distillation duty is provided by the reformed gas train cooling so the flowsheet does not need to incorporate backpressure turbines to satisfy the LP steam demand. Therefore, switching the compressors from turbine to motor driven does

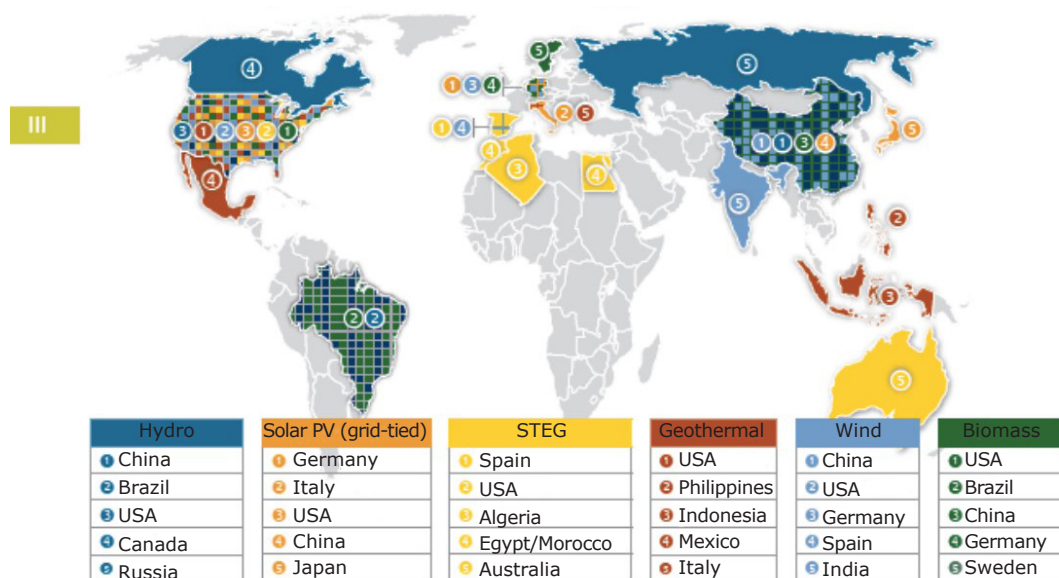

Fig. 6. Top countries with installed renewable electricity by technology in 2012 (8). PV = photovoltaic; STEG = solar thermoelectric generator

not mean additional MP steam has to be let down to the LP steam level and so removing the steam driven turbines has a direct impact on the load of the auxiliary boiler, in proportion to the increase in electrical load and hence allows a total reduction in emissions.

For the GHR + ATR flowsheet, running all the compressors, pumps and air coolers on imported electricity shows a modest saving on the GHG emissions if the supplied electricity is from the grid with a typical North American electricity mix. However, using a renewable energy source to provide the electrical import power to the plant has a significant impact on the GHG emissions for producing methanol from natural gas, with the

emissions over half that of the CR flowsheet, which has the second best emission figures. The GHR + ATR flowsheet is the only flowsheet that doesn't generate HP steam as a byproduct of the process, allowing a large portion of the energy requirement of the ISBL plant to come from electricity import. This in turn allows a large portion of the energy required to make methanol to come from a renewable source.

In addition to calculating the well to product GHG emissions using GREET it is also possible to go one step further and calculate the well to wheels value which allows methanol as a fuel to be compared to all the other available transportation fuels. **Table V** shows the comparison between the methanol well

Table V Well to Wheel Greenhouse Gas Emissions (9)

Fuel	Vehicle	Vehicle operation	Well to product	Total
		gCO ₂ e MJ ⁻¹	gCO ₂ e MJ ⁻¹	gCO ₂ e MJ ⁻¹

Notes for Table V

i) The numbering for well to product and total GREET GHG emissions refers to the following flowsheets:

1. SMR
2. SMR + CO₂
3. CR
4. GHR + ATR

The GREET values quoted for the methanol (85%) + reformulated gasoline E10 (15%) fuel have been peer reviewed but have not been confirmed as official GREET numbers by the Californian government

ii) The net CO₂ GREET numbers are shown in brackets

iii) Based on USA ethanol produced from corn

iv) Electricity based on typical North America mix

to wheels carbon emissions and some of the other standard fuel types.

What **Table V** shows is that methanol as a fuel has a lower carbon intensity than gasoline over its full life cycle, irrespective of which flowsheet is used to produce the methanol. It also highlights that methanol as a blend stock for gasoline is less carbon intensive than using ethanol, unless non-captured CO₂ injection is used on the flowsheet.

When producing gasoline from crude oil, the well to product value for reformulated gasoline E10 in **Table V** is 25.0 gCO₂e MJ⁻¹. Therefore, to reduce the carbon intensity the well to product GHG emissions for producing gasoline from natural gas *via* methanol would need to be below 25.0 gCO₂e MJ⁻¹. As **Tables III** and **IV** show, with the exception of the GHR + ATR flowsheet, the GHG emissions for producing methanol from natural gas range from 31.2–51.3 gCO₂e MJ⁻¹ which is already higher than the 25.0 gCO₂e MJ⁻¹ for refining crude oil. Therefore, even if the carbon intensity of producing gasoline from methanol was zero, it would not be possible to produce gasoline with a lower carbon intensity from natural gas *via* methanol. The only exception to this is the GHR + ATR flowsheet using the maximum electrical import from a renewable energy source which has a well to product value of 15.1 gCO₂e MJ⁻¹ and there are companies that are currently developing novel flowsheets, incorporating the GHR + ATR process and renewable energy sources to produce low carbon intensity gasoline from natural gas.

Conclusions

Through raising HP steam in the SMR, SMR + CO₂ and CR flowsheets it is not possible to easily

incorporate renewable electrical energy into the process to enable a reduction in carbon intensity of methanol. The heat integration in the GHR + ATR flowsheet allows the flexibility to significantly increase the electrical power input into the ISBL plant. This not only allows a large reduction in the GHG emissions from the ISBL plant but also allows a total reduction in the carbon intensity of the process over its entire life cycle and significantly so if the source of electricity is from renewable energy.

From well to wheels, methanol produced from natural gas provides a significant reduction in GHG emissions when compared to standard gasoline. Even when compared to ethanol, methanol shows a modest reduction in GHG emissions and emphasises why methanol is such a good supplement to gasoline fuel for the reduction of GHG emissions.

If the intended destination of the gasoline is to a state or country that has implemented a LCFS, then in general making gasoline from natural gas *via* methanol does not reduce the overall carbon intensity of the gasoline and in fact would increase the carbon intensity over the whole life cycle. The exception would be processes that are able to utilise both renewable energy and the GHR + ATR flowsheet in order to produce a low carbon intensity gasoline.

Glossary

CR	Combined reforming, with steam methane reforming and autothermal reforming
GHG	Greenhouse gas
GHR + ATR	Gas heated reforming and autothermal reforming
LCFS	Low carbon fuel standard
M15	15% methanol and 85% gasoline fuel blend
MTPD	Metric tonnes per day
OSBL	Outside battery limits
SMR	Steam methane reforming
SMR + CO ₂	Steam methane reforming with maximum CO ₂ addition

Appendix A

What is the Low Carbon Fuel Standard?

As further background surrounding the LCFS, the following is a summary (11). In California, USA, they have developed a method for determining the carbon intensity of a fuel for the whole of its life using the concept from well to wheels. In January 2010 the Californian state government implemented the LCFS which calls for a minimum 10% reduction in emissions per unit of energy by 2020. The policy focuses on decarbonising fuels for transportation and is a performance standard that is based on the total amount of carbon emitted per unit of energy. This crucially includes all the carbon emitted in the production, transportation and use of the fuel.

In America, transportation accounts for two-thirds of all the oil consumed and causes approximately one-third of all the GHG emissions. In an attempt to address this, the LCFS assigns a company (for example an oil refiner, importer or blender) a maximum level of GHG emissions per unit of fuel energy it produces. This level then declines each year with the intention of putting the state on a path to reducing total emissions.

There are several ways that regulated parties can comply with the LCFS and in the Californian model there are three compliance strategies available:

- (a) Refiners can blend low GHG fuels, for example biofuels made from cellulose or wastes, into gasoline and diesel.
- (b) Refiners can buy low GHG fuels, for example natural gas, biofuels, electricity and hydrogen.
- (c) Refiners can buy credits from other refiners or use banked credits from previous years.

The LCFS in California is not the only fuel standard that has been implemented. A similar scheme is in place in British Columbia in Canada and others have been proposed in Ontario, Canada, several other states in North America as well as the European Union.

Cambria Keely

My name is Cambria Keely, I am 18 years old in my fourth year of my Bachelor's in ecology at Western Washington University, and I have been protesting the proposed refinery for a quarter of my life.

I was recently asked by a reporter about what moved me to get involved with the protest against this refinery. The answer is that fear, anger, and disbelief morphed into a feeling of responsibility to protect my hometown. Kalama and Cowlitz County officials have made it very clear that their priority is monetary profit, not protecting their constituents, thus it becomes our duty to protect ourselves and those around us by representing the community to decision-makers such as yourselves.

My companions and I have collectively committed thousands of precious hours, day and night, on holidays and birthdays, to defeating this calamity. One of my friends and fellow activists, Chris Turner, who spent decades fighting the climate crisis and frequented these very methanol hearings with her powerful testimonies, recently spent the last few hours of her life ensuring that her research would continue to spur the fight. I know she would be here tonight if she could, explaining the proper calculation of statistics in the DSSEIS.

I am telling you this to emphasize that we are not here for fun, we're here because we need to ensure that Washington is headed for a carbon-negative future. Climate legislature must be extensively considered and respected.

Every time I visit my 93-year-old grandfather, he asks me when I plan to start a family, and how many kids I want to raise. I tell him I'd like to have one or two kids in my 30's. What I don't tell him is that I'm terrified of what the world will look like in 20-30 years. Will the next generation know what it's like to have a snow day, and let raindrops fall on their tongue, and get a bird's-eye view of the world from the top of a tree? I can't imagine who I would be if the outdoors weren't pure enough for me to have those experiences. Will my children have to wear a mask everywhere to decrease their pollutant inhalation, and gape in disbelief at history books which show photos of a clean, healthy Columbia River?

Article 25, Section 1 of the Universal Declaration of Human Rights states "Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family." I cannot in good conscience pass onto my children the burden of spending every day fighting for basic human rights.

We will not allow ignorance of the consequences of the construction of the world's largest methanol refinery in Kalama because if this project is permitted, the consequences are unavoidable: pollution of the biggest river in our region and vital ecosystems that rely upon it, the release of toxins into our air that is usually clean and healthy, and the exertion of powerful and plentiful greenhouse gases.

Change cannot wait. It is your mission to preserve, protect, and enhance our ecology and we are counting on you to quash this fossil fuel project. We believe that we can do better than to enforce a

fossil-gas dependent economy. Once again, I am here to ask you with utmost earnestness to please deny the shorelines permits for the proposed Kalama fracked-gas-to-methanol refinery.

[Expanded comments from those given in oral testimony on 9/22/2020.]

Cambria Keely

At the beginning of the pandemic, the shutdown of Asian factories left blue skies in Beijing, a city known in the U.S. as the epicenter of extreme air pollution. Environmentalists celebrated the idea of a world where people everywhere could breathe freely without concerns of lung diseases, and biodiversity would begin to thrive again. As industrial cities started to become pure again, and those of us that rely on their products still had access to essentials, environmentalists tried to spread the message of "Look, we can do this! This is our chance to make our Earth healthy again!" Despite the fact that factories have since reopened, we have not missed our chance to put an end to unnecessary carbon pollution.

At the very moment that I am typing these words, Earth's carbon budget is rapidly depleting. According to Carbon Brief, the IPCC report on the 1.5 degree Celsius maximum temperature rise suggests that we will hit that temperature rise mark next year, based on 2016 carbon emissions. Does that not terrify you? It terrifies me. Other sources say we have 25 years to prevent a global temperature rise of 2 degrees Celsius, which is barely the blink of an eye in terms of the Earth's history. 25 years is just over half as long as the Kalama fracked-gas-to-methanol-refinery is expected to be in production, meaning that if this project is permitted, the methanol refinery will still be heating our planet long after the 2 degree temperature rise has been surpassed.

"We do not have the time" was one of the most emphasized phrases in the recent methanol hearings, and it is completely correct. We absolutely do not have the time to make exceptions. We must not allow any new fossil fuel industries to make our Earth sicker, and furthermore, must shut down any existing fossil fuel consumers in Washington. I beg you with utmost urgency to deny the shorelines permit for this fracked gas polluter.

Lang Baker

As a former resident of Battle Ground WA, who loves the beauty of the great Northwest, I urge WA DOE to honor its mission to "Protect, preserve, and enhance the environment for current and future generations" by taking all steps available to prevent this project from proceeding. It portends devastating consequences for future generations of humans and other species.

Rebecca Railey

Twenty years ago, I moved to Washington State because of its beauty and progressive politics. I am hoping that the state will REJECT this permit and try to lead the country in clean energy production. We just lived through a week of Hazardous air quality, a direct result of global warming, to which this plant will add. The smoke and mirror facts about the global benefits of methanol burning is just that. We should be moving away from any type of fossil fuel and leading the way, not approving this plant for the gain of a few jobs and profits for the stockholders. I have already let Governor Inslee know how I feel. I urge you, along with so many concerned citizens, to REJECT this permit. From the in-person and virtual meeting I just attended, the vast majority are against the project. Will you listen to the people or a small minority who will directly profit? Thank you. Rebecca Railey

Phyllis DeCristofaro

Global warming is primarily fueled by atmospheric carbon from fossil fuels. The Kalama Methanol Refinery will be the largest GHG emitter in Washington, it is dependent on fracked gas, one of the worst fossil fuels, particularly because it leaks methane. Methane is 80 times stronger in GHG's than Carbon Dioxide (Co2). Listen to the scientists and our governors who are calling for a halt to new carbon emitting fossil fuel projects and move to renewable energy - for a livable world for our children. Stop the Methanol Refinery project and help us have a greener future.

Amy Jarvis

I am shocked and horrified that you, the Port of Kalama, and the WA Environmental Board would even consider allowing a water and gas guzzling, air polluting Chinese methanol refinery to be built along our shared Columbia River which runs through 7 states, 1 Canadian province, 4 mountain ranges, drains more water into the Pacific Ocean than any other river in North or South America, provides drinking water to numerous communities along its course, and irrigates 600,00 acres of farmland. This is not a decision to be made in isolation. As a long time Oregonian residing along the Columbia River, I worry for the health and safety of my family, city, state, region, local wildlife, and upward to our planet. It would be unconscionable to allow the Chinese to buy or convince their way into passing the hazards of this plant onto us! Do not allow NW Innovation Works to build this refinery.

Elizabeth Cross

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Gina Hicks

Please reject the methanol refinery and deny the shorelines permit. The current seis is woefully inadequate. It is is deeply saddening that the DOE has based their results using the assumption that there will be no efforts by anyone on the planet to reduce fossil fuel use. China has recently pledged to become carbon neutral by 2060. Further Washington has pledged to reduce our carbon emissions. the report uses unrealistically low bottom up methane leakage values. The report should also look at a more realistic scenario of the methanol being used as a fuel as the applicant indicates to its investors. The increased carbon emissions from this plant should be enough to deny the project. This plant should not be built as the climate impacts will be more than the world can handle. Also, there must be a realistic mitigation plan in place for all the effects. A plan to make a plan is not sufficient. We need to actually take care of our environment and this project will have too many negative impacts to be allowed to go forward. People and planet over profits and promises.

Felice Kelly

Humanity stands on the edge of a precipice, where we will decide to either reduce our greenhouse gasses and deeply decarbonize our whole economy or we will continue to slide towards climate chaos in a much warmer world. Which of these outcomes we will face depends on many small and large decisions that we will make, but the Kalama Methanol Plant is a huge decision, and should be an easy one to make. This plant is the wrong decision for the climate and for the Columbia River. The Kalama Methanol Plant would produce 4.6 million tons of carbon pollution each year, pushing Washington past its greenhouse gas goals.

The proponents of this project claim that the emissions would be better than if this plant were based elsewhere, but that argument ignores the effects of induced demand and is based on pure speculation about what the alternative "dirtier" sources of energy might be.

Northwest Innovation Works has misrepresented the purpose of the methanol produced at this plant, and told investors that it will be burned as fuel while telling the state of Washington that it will not be burned. This has a major impact on the projected climate affects of the project.

True decarbonization requires moving away from all fossil fuel use as quickly as possible to ensure a livable future. This project is incompatible with those goals, which are goals that have been embraced by Washington voters and Washington state leadership. To fulfill our obligations to fight climate change we must not build the Kalama methanol plant. Please deny the permit due to the lifecycle climate emissions of the project.

Phillip Englund

Dear Department of Ecology,

We are in a worsening and undeniable climate crisis. Every year now, we break heat records. Three years ago, in 2017, I stood with my father at a lookout point at midnight, watching what was happening across the Columbia river. I described it thusly at the time: "[There were] gigantic flare-ups, massive pillars of flame as trees exploded. A significant swath of the horizon just orange and spreading at a tremendous rate, burning so brightly that when we walked back down the trail it looked like kind of a faux-sunrise out of direct view; we could even see the fire from our deck when we got home around one-thirty. Some sort of apocalypse come to Oregon." That was the Eagle Creek fire. I'll never forget my Dad telling me that if the winds shifted and the fire jumped the river, we would have to evacuate.

This year, the entire west coast has gone up in flames. Here in Washington, 330,000 acres burned in a *single day.* 40,000 people had to evacuate their homes in Oregon. Millions of acres have been lost, I don't know how many homes, and the wildfires are still ongoing... as of this writing, an article published half an hour ago reports that nearly 70,000 people have had to be evacuated in Northern California. These numbers are so unthinkable enormous that they're almost difficult to comprehend. It doesn't seem real. And yet this *is* our reality.

I personally had a scare when a brush fire started very close to my parent's house in Washougal (from which I have since moved out), but as happened in 2017, we were lucky--the wind was blowing in the right direction and kept it from spreading. It was brought under control. Luck, however, runs out sooner or later; I don't know how many more times we can roll these dice. And even though we've been fortuitous enough to dodge the horrors of facing unstoppable flames to date, all of the Vancouver/Portland area and beyond was choking on smoke for at least a week, the air plunging far past the uppermost "hazardous" level on the Air Quality Index, to a point of toxicity *which didn't even have a designation.* God only knows how that will affect people's health in the long term, especially those with poor shelter or none at all. Smoke from our wildfires reached the east coast, and even Europe. This is not an aberration--thanks to the ungodly amount of greenhouse gas emissions we've already put into the atmosphere, this is going to be the new normal, and it's going to get worse and worse unless we take bold and immediate action to put the brakes on climate collapse.

Suffice it to say that such bold and immediate action does NOT include building, or allowing to be built, the world's largest methanol refinery in Kalama. It would use more gas--and necessitate more fracking--than all the Northwest's biggest cities combined and all the power plants in Washington. The facility would cause around 4.6 million tons of carbon pollution each year (and up to 9.4 million tons by some estimates), and become one of the largest greenhouse gas emitters in the state. In our current climate emergency, that is purely and simply unconscionable.

Having attended one of the comment sessions for the second supplemental EIS, it seems clear that supporters of this awful project have only two arguments, and neither of them are good. The first is, of course, predicated on employment: the refinery would bring lots of jobs into the area, and people need jobs. This, taken in a vacuum and absent anything else, is true. However: besides ignoring the

fact that this refinery would spell complete ecological disaster, what's frustrating is that these kinds of arguments always carry an implied assumption that a large-scale, rapid transition to green energy (i.e. what we need in order to save ourselves and maintain a habitable planet) somehow wouldn't just as easily bring with it a ton of well-paying jobs. It absolutely would. Kalama does not need to settle for jobs which only serve to hasten the complete destruction of our environment; Kalama deserves better.

Still, I am not a resident of Kalama, and jobs there are not my pervue. Nor are they the pervue of the Department of Ecology. So let us move on to what is more pertinent.

The second argument is the far, far worse of the two--while I can believe the jobs argument is misguided, I can also believe it is made in good faith. This one, on the other hand, is insidious, duplicitous, and completely outrageous. It is a point of view designed specifically to greenwash, to hoodwink people and peddle a dangerous mirage, and to this end it uses and highlights what is so tremendously flawed about the Second Supplemental EIS itself.

The argument in question claims that the proposed Kalama refinery, unimaginable polluter though it may be (and its proponents do concede that point), is somehow GOOD for the environment.

During the presentation which preceded the online hearings on this matter, an incredibly misleading graph was displayed in regards to the Department of Ecology's findings, portraying how much pollution would allegedly occur **with** the Kalama refinery (a smaller bar) as opposed to **without** the Kalama refinery (a larger bar). Stated on your website under "Preliminary Report Findings" is the justification for that display: "Worldwide demand for methanol is likely to increase in the decades ahead, leading to higher greenhouse gas emissions with or without the Kalama facility... Methanol made in Kalama could produce lower greenhouse gas emissions than many competing methanol supplies, from coal or less efficient natural gas sources. This means that global greenhouse emissions would increase with the addition of the Kalama facility, but likely less than they might if the demand was met by other sources."

This conclusion was reached, according to the aforementioned presentation, by considering such things as "economic analysis" and "market speculation." Or, translated into plain language--bullshit.

Said graph and associated statements are not indicative of any sort of reality; rather they represent pure, irresponsible guesswork. They're part and parcel of a capitalist shell-game, trying to bamboozle the audience into believing there's a positive outcome under a cup where actually none exists anywhere (and it therefore becomes an easily deployed tool for gaslighting from certain unscrupulous quarters: "You've already won this, climate people! Don't you see? The project will actually **help** the environment, so why would you want to fight it?").

To be clear: the ONLY thing the Kalama methanol facility will do is add a massive amount of emissions on top of already-existing emissions. Any other outcome is noticeably propped up using such slippery qualifiers as "likely," "could," and "if". Should this monstrosity be built, it doesn't replace a competitor--some coal or natural gas plant in China doesn't just magically shut down or disappear. Nor would its existence somehow deter other "less-efficient" sources from trying to crop up, particularly if there is indeed this claimed rising demand (which I'll address in a moment). The proposed refinery is in no way, shape, or form the lesser evil or a step in the right direction. NOTHING is reduced. Only increased by a suicidal amount.

And that brings us to this idea that the demand for methanol is likely going to rise. And my response to that is: of COURSE it is if projects such as the Kalama refinery are allowed. It's the very definition of a self-fulfilling prophecy. And since we're already into the realm of speculation, allow me to project a different scenario, just as plausible--if supply is replaced by better alternatives, demand for methanol will go down and go up for said alternatives. The most terrible options don't have to be foregone conclusions.

Finally there is the mitigation aspect to consider, another piece of deception meant to lull people into complacency. Northwest Innovation Works is claiming it will mitigate all in-state (but not out-of-state) emissions. This is not only vague and utterly, utterly insufficient, it is also completely unenforceable. NWIW has already proven themselves to be flagrant, completely unscrupulous liars. They repeatedly claimed to regulators that the purpose of the refinery was purely for the production of plastics, while openly telling their investors that the methanol produced would be burned for fuel in China! Why on earth should this sleazy company be trusted to even do the bare minimum to mitigate anything? Their fundamental dishonesty should have killed the proposed project by default the second it came to light in 2019.

All of this is to say, stopping the Kalama methanol refinery is a moral imperative for the well-being of our beautiful Pacific Northwest, our country, and our planet. The evidence against it is overwhelming. I urge you in the strongest terms possible: please do the right thing, for current generations and generations to come, and reject the shoreline permit.

Our future depends on this.

Thank you for your time,

Phillip Englund

Jennifer Vinnard

Dear Ecology, as a Kalama resident, I'm sure by now you see that, of the few who comment or participated in the virtual and public hearings, opposition to this proposed methanol plant has undeniably grown. More and more people are realizing just what this refinery would do to our beautiful town, as well as the state, the country, our planet, our health, our property values, and all to benefit China while we endure the harm.

This proposed plants entire platform is that this refinery would benefit the planet, "displacing" coal...yet there's ample proof showing the opposite is true. Documents showing that China is going to build a coal burning power plant in each province by 2023. Their dependance on coal is too strong, it's not financially feasible to retrofit businesses and homes to cleaner fuels or renewable energy sources. Their demands for coal only grow, digging and importing more and more every year..so why are you making assumptions that guide your decision regarding their permit? The recent announcement about China setting a goal to be carbon neutral by 2060 does not mean a reduction of use, rather to emit the same amount of "good" emissions to "bad", something that's questionably obtainable, but they'll still be burning coal.

NWIW has been deceitful, for one, they told everyone that the methanol would be used SOLELY for making olefin's for plastics, yet their PowerPoint presentation, 25 of 26 pages all about using methanol for fuel, just one discussed plastics. I appreciate that you partially took that into consideration with the draft SSEIS, but 40% is Not Enough..why wouldn't you do the analysis for 100%? Especially when "fuel uses" was such a commanding enticement to their potential investor's! Waving the illusion of local jobs or money has lured supporters, trusting China's intentions over facts and proof, but now support has changed. Some prior supporters finally looked at the documents and examined the details, some don't trust China due to the coronavirus, some realized that a minimum of 4.6 million metric tons per year of chemicals and carbon wouldn't be good for our health, our beautiful mountainous paradise, whatever the reason, I hope that Ecology is taking the opposition into account in your decision, along with no clear plan on how they intend to mitigate their emissions..the risks of building the lateral pipeline on landslide prone hills and under our only freeway from Portland to Seattle, built on dredged river landfill adding to the earthquake liquifaction risks,the 2nd pipeline that would need to be installed to handle the demands of its current customers and the plant, what happens if that's not approved?

There are just so many assumptions and speculations surrounding this refinery, please base your decision on what you know, rather than what you think the gas market will be like in 40yrs. With the potential for new, green fuel technology to replace fossil fuels, we have no idea what the next 40yrs holds, amazing growth in green tech is booming, approving this project will lock us into 40 years of ghg/carbon emissions, at the time when we need to do everything we can do reduce our ghg/carbon footprint..please deny the permit. For all of us! Thank you for your hard work,
Sincerely, Jennifer

Debra McGee

Washington should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama.

The fires in Oregon and Wash. and the growing multiple devastating weather events are all "evidence" of what scientists are telling us.....we must STOP use of fossil fuels because they are heating up the atmosphere.

As a public school educator whose first job was in Yakima, I love the beauty of Wash. state. Climate change is destroying our home!

Please reject this project that will only take our species and all life closer to the edge of extinction. Time to change or die.

Please for the sake of my grandchildren and your own- reject this project.

Sincerely,

Cyndra Norman

I am opposed to building the KMMEF Methanol production facility. Our state should not be encouraging the production of greenhouse gases given the damage they have done to our climate. We should have long ago done our best to find other ways forms of energy for manufacturing, transportation, and heating. But we can start now with not allowing this facility to add to greenhouse gas emissions.

Carol Raphael

Hello. I am a retired writer living in Portland, Oregon and am deeply concerned about the proposed gas-to-methanol refinery in Southwest Washington and the impacts it will have on our environment and on future generations. I have two grandchildren who are already suffering the effects of a global pandemic and the effects of climate change with the recent devastating wildfires that have done huge and long-lasting damage. We must begin to respect the limitations of our planet and live in harmony with the natural world.

In particular, this project would cause millions of tons of greenhouse gas pollution, use millions of gallons of water from an aquifer connected to the Columbia River each day, pollute the air with cancer-causing emissions, and pose safety hazards during an earthquake. The refinery would use more fracked gas than all the gas-fired power plants in Washington combined. And the refinery would induce new fracked gas pipeline expansions throughout the region. All of these impacts are an excessive and unacceptable cost for fuel, which can now be acquired in many more sustainable and healthy ways.

I emphatically request that the Department of Ecology reject the methanol refinery and deny the Shorelines Permit for the project.

Nicole Acevedo

A Methanol Plant in Kalama would be a disastrous. Methanol can be lethal to the health of people in community and you do not know how much can escape and harm the community and the water around it. I am opposed and if taken further there will be protests. this is not what we need nor want in our community. Our air has already been disrupted my smoke in the air, now long term affects of methanol can cause long term health problems to otherwise healthy people. I strongly opposed Kalama Manufacturing and Marine Export Facility

Monica Zazueta

Dear Department of Ecology.

I first want to say thank you for all that you do. Second I would like to say I oppose the proposed fracked gas to methanol refinery in Kalama. I have been on a journey this past year ever since I found out about climate change. I've been to workshops, council meetings, organized a protest, written LTE and spoken on webinars about climate change. The world is waking up and seeing that the burning of fossil fuels is making the earth heat up. The science is clear. My 6 year old son Aries is scared about his future. He says we have to tell the world about the earth heating up and we have to stop it. I am trying everything I can to save his future. I am even sending letters and t-shirts with, "Birthplace: Earth Race: Human Politics: Freedom Religion: Love", written on them to John Jay and Rich a morning radio show on Z100, 100.3 FM to try and spread the message of love and we are all one species that needs to work together to save us all. My job and my joy is to protect my son. I will bug our elected officials about finding solutions now until it is done. Everyday we should be working towards equality for all and a green planet. We can keep our temperature down and at a safe level but we must act now. Stop this project from going through. My sons life depends on it.

Thank you for your leadership and time.

Monica Zazueta
Concerned momma

Dena Turner

I oppose Kalama because if built, The Methanol refinery would require massive pipeline expansions. Gas pipelines leak methane (over 80 times more warming than CO₂), have a history of dangerous explosions.

I oppose Kalama because of fracking. If built, thereby increasing the demand for natural gas in North America, this project will increase the demand for fracking. Fracking damages public health, pollutes water and contributes to climate change.

I oppose Kalama because of illegality and corruption. The port of Kalama and Cowlitz county, lead agencies for the EIS for the Methanol refinery in Kalama, have a conflict of interest. They are both receiving money from NWIW (the company proposing the project), the county through tax dollars and 'philanthropic donations' and the port through monthly rent.

I oppose Kalama because of local environmental injustices. The proposed methanol refinery in Kalama will increase pollution in a town that is already near the freeway, has high unemployment and poverty, and has oil and coal trains coming through consistently. Cowlitz County already experiences higher than average cancer rates.

Additionally, the Kalama methanol refinery would take 5 million gallons of water/day out of the Columbia River, and ship up to 6 tankers per month on the Columbia river. A methanol spill could be devastating for salmon. Orca Whales are starving because not enough Salmon are making it to the Salish Sea.

Kalama Reuter

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms. Kalama Reuter
920 NE Fields Ave White Salmon, WA 98672-0440
kalama@embarqmail.com

Helen Sargeant

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

We have one common home and we must protect it. We are on the brink of a no-return climate crisis so for the sake of all, and the planet we cannot regress by increasing use of fossil fuels.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. helen.sargeant@mygait.com

Heather Grube

Thank you for the opportunity to comment. While Northwest Innovation Works has promised to mitigate all of its carbon footprint in Washington state, the complete life cycle effects of its methanol production facility expands far beyond our state borders, and are just too detrimental to support. Our global lands and waters are choking from plastics pollution and fossil fuel emissions. There is no guarantee the methanol produced in Kalama will not be used for single use plastics or fuel. Perhaps by denying the Kalama permit, some fracked gas producers will cease their harmful operations as well.

Thanks again,
Heather Grube

scott theisen

The Kalama Manufacturing/Export facility is an incredibly bad idea. Everyone of us needs to focus on combating climate change. Fracking does not do that. Making more plastics does not do that (plastic "dust" is now in the air we breathe.) This is a bad project at an even worse time.

Ashley Bonnell

Dear Director Watson and Department of Ecology,

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Yours sincerely,

Ashley Bonnell

Slschwartz1951@yahoo.com

The methanol plant if built will be an environmental disaster. It will increase the state's greenhouse gas emissions by almost one million a year. This would make it one of the ten largest sources of emissions in Washington State. Greenhouse gases are the main reason for global warming.

You need to consider the fracked gas because it is being used to make plastic. There will be more extraction of natural gas than originally estimated. The gas would be fracked. Fracking is not good for the environment. The chemicals used are harmful to humans, especially pregnant women and the developing baby. There is a 40% chance of having a premature baby and 30% of high-risk pregnancy. Fracking gas causes people to lose water for cooking, drinking, taking baths or growing crops. People turn on the kitchen faucets and fire comes out not water. There are health risks such as shortness of breath, wheezing and coughing.

The pipelines to carry fracked gas are old and have been for years. They will be subject to accidental leaks and deliberate release gas called blow downs and even devastating explosions. These pipelines will go next a cemetery where people loved ones is buried. If the pipeline leaks I know I would like to get gas on my relative.

Extra diesel boat traffic going to the plant will add to global warming. Ships emit black carbon, which causes pollution. The International Maritime Organization estimates that a carbon dioxide emission from shipping adds to global warming. There will be more ships on the river going to and from the methanol plant. The ships will not be good for the river creatures. The ships traveling on the Columbia River do make the river warming.

The states of Washington, Oregon and California are burning. Whole towns have burned. There is loss of life, people houses and jobs are gone. This is because of global warming. This methanol plant is built it will add greenhouse gases into atmosphere, which causes global warming. You need to say know too much pollution.

Anonymous Anonymous

I am among many voters Not wanting Fracked Gas and Electricity to be used by Methanol Refinery. I won't waste my words or your time going through all the environmental hazards this would cause.. Do you really want your forever next generations to be forced to breathe the toxic fumes just so put money in the pockets of all the powers that benefit from this? We need to leave this world a better place for our children and make their children proud to know that we did everything we could to give them clean water, clean air, and a perfect eco system.

Fracked Gas does indeed qualify as extremely harmful to the environment, along with pipelines, releasing greenhouse gases, fossil fuel spills and leaks, burning methanol as fuel in China, and the endless stream of single-use plastics.

We, as a human species need to act now to save our planet. Subsidized fossil fuel extraction and usage is devastating this world. Now's the time to make the switch to green, renewable energy. Our state is supposed to be all about that! Cowlitz County's citizens could be put to work building light-rail or a high-speed magnetic-levitation train along the I-5 corridor from Portland to Seattle, for instance! Good jobs!

I hope that we can continue to count on our Governor, who claims concern for the Climate Crisis, along with Laura Watson and her Department of Ecology Team, to lead the way by rejecting another Fossil Fuel Disaster. Neither Indigenous Peoples of Canada nor citizens of Kalama wish to reside in "sacrifice zones."

Thank you for your time.

Mark Keely

Ecology WA's Water Quality Program

<https://ecology.wa.gov/About-us/Get-to-know-us/Our-Programs/Water-Quality> states, "The Water Quality program's goals are to prevent and reduce water pollution, to clean up polluted waters, and engage citizens in the work to protect and restore water quality in Washington."

This refinery would sit at the confluence of the Kalama River and Columbia River, a natural salmon spawning area. One gallon of methanol depletes the oxygen in 198,000 gallons of water. (Source: Univ. of Washington Urban Waters video, 2016-03-03, between minutes 34 and 39, <https://www.tacoma.uw.edu/methanol>.) What will happen when a tanker holding 14 million gallons of methanol goes aground (as ships often do in the Columbia) and starts leaking? Potentially deoxygenate 2.7 trillion gallons of water killing every living marine creature. Stand up for your own Water Quality Program goals. DENY Kalama methanol refinery shorelines permits.

Mark Keely

WAC 173-485-010 PETROLEUM REFINERY GREENHOUSE GAS EMISSION REQUIREMENTS. The purpose of this rule is to determine reasonably available control of technology for emissions of GHG emitted by petroleum refineries located in WA state. The emissions standard for this rule were developed under the requirements of RW 70.94.154.

NWIW's KMMEF *is* a refinery (Methanol is distilled in a "refining column," which is likely why project backers of the plant originally referred to it as a refinery. Now they balk at that term and have scrubbed it from their materials probably because it sounds nasty. But it is what it is, a petrochemical REFINERY.)

I've read the DSSEIS carefully. NWIW has not shown reasonable available control using technology for emissions either onsite or through their vague and flimsy mitigation framework. NWIW is skirting our laws of Washington state. The laws we set in place to protect our environment – land, air, soil, water, animals, plants, and humans. Obey our WA laws. DENY the shorelines permits. Let's move forward with NO new petroleum or petrochemical refineries in Washington State.

Linda Horst

"We can't solve problems by using the same kind of thinking we used when we created them" ____ Albert Einstein.

This kind of rational and forward Einsteinesque thinking is no where to be found in NWIW's sales pitch.....burning more fossil fuels is good for the climate! In fact, the entire premise of the Kalama project is establishing 40 more years of consumer demand for gas rather than moving away from fossil fuels. Basically, NWIW's solution to the climate change abyss we are descending ever deeper into is to 'go deeper' and all our climate change problems will be solved!

Ecology's analysis in the Draft SSEIS has clearly demonstrated the KMMEF refinery would, at the very least: produce 184 million metric tons of carbon pollution over the 40 year life span of the refinery; be equal to around 5 percent of the states total climate emissions from all other activities combined; rank among the top polluters in the state; generate 2 million tons of carbon pollution in China each year if 40 percent of the methanol production capacity is burned as fuel; and if the full methanol production capacity of the refinery is burned in China, 5 million tons of carbon pollution will be generated each year!

The factual realities of this NWIW proposal are irrefutable. This refinery is the antithesis of all that Ecology is tasked with protecting, preserving and enhancing....Washington's environment! The facts speak for themselves! Deny the permit .

Sandra Cobb

With the severe impact of climate change, all of our energy and funding should go towards renewable energy. This is for the USA and the world. Both methane production and plastic production should be discouraged and unfunded. It is totally unnecessary and detrimental to our health and environment. Please cancel this project and go 100% renewable.

Denise Schafte

There is no more time to continue energy production as usual when there are a myriad of options to replace any energy produced by this archaic system and the oil and gas industries being handed all rights over the American people and their futures.

It is insane to propose anything that would contribute to continued greenhouse gases and environmental destruction with exponentially devastating wildlife fires, hurricanes, desertification, temperature increases far higher than expected, poisoned water, cancer rates now at 1 out of 2 people, 500 extinctions a month, crops that are requiring more and more fertilizer every year due to soil degradation, mass refugee crisis world wide due to rising sea levels and evacuations of island states and coastal areas and due to food and water limitations.

Joel Carlson

Fracked gas or methane is extremely harmful to our environment and must be banned. New construction must be electric only with heat pumps, etc. We must also ban the fracked gas LNG projects in Tacoma and fracked gas to methanol project in Kalama. It is vital that we get this done now!

James Denton

Hello, My name is Jim Denton and I just want to say, that I am completely against this plant being upwind from my home... and directly on banks of my beloved Columbia river. We already have enough dangerous operations right on our riverbanks.. and adding this one is not a good idea. All the money in the world doesn't make this a worthwhile venture for Kalama residents, nor Americans in general. For every fact I present against... I know you have ten that state your point for it. So I just would like to say, I just don't want it here.. upwind from my home, nor sitting on dredge spoils from the Mt St Helens eruption. Ever heard of "Liquefaction"? Our natural resources are more valuable than the Port and the Chinese getting richer at cost of Kalama residents and our beloved Columbia River system.

Alison Stern

I encourage you to reject the permit for the Kalama Manufacturing and Marine Export Terminal. I have grave concerns about fracking - and the movement of fracked gas to the terminal would require the building of pipelines that are dangerous for people and the environment. The shipping of methanol to Asian markets is also very hazardous to the environment. We need to be focusing on ways to help avert a climate crisis and I believe that this would be a step in the wrong direction for our state. Thanks you for your consideration. Alison Stern

Allison Ostrer

>> ALLISON: Great I will be brief, my name is Allison Ostrer I live in Seattle and I am a voter and tax payer and the irony of having this meeting.

The stated purpose of this Kalama is to ship fossil fuels to Asia and already drowning in plastic. We really don't need more.

I don't want more. Regarding the use of offsetting coal as a dying industry, its use will continue to fall without approving the Kalama project and stating we should approve it quote unquote to reduce coal use is the last gentleman was talking about. I think was disingenuous, misleading and false. I guess all use of fossil fuels for their life when we don't need to do that. I want Washington to create more clean energy companies and not, slightly less dirty if we ship the numbers just right companies. And the chance to have a major impact on reducing fossil fuels and on saving the environment. This industry needs our coast so we can say no to this project and have a direct impact on plastic pollution and climate change. This is a rare opportunity to think globally and acted globally by rejecting the project.

Anastasia Pyz

>> Hello my name is Anastasia prize anime 25-year-old youth climate activist working with sunrise PDX and 350 PDX out of Portland. And I just cannot fathom why in a time like this, as the previous commentator just noted, our entire coastline is on fire, the effects of climate change are just beyond undeniable at this point and talking about a project that needs to exist in order for just other companies to pollute less is just asinine. The only way forward is to not build places like this. We don't need a single bit more of plastic in our oceans looking every single bit of marine wildlife.

I mean we are about to enter a point in history where we have more poundage of plastic in our oceans than we do real fish. We cannot subsidize and keep making these changes happen for jury ways of fuel. The only way forward and the only way to save our way of life is to not pander to these companies that are just unaccepting of the damage that they are doing. We can only invest in green electric, alternatives. There is just no way around this. We cannot keep polluting the planet and justifying that this is an okay project to make on the banks of the river that we know will call innumerable damage. Just do what is right if you have any shred of decency and you. I'm done.

Becky Fletcher

>> These are desperate times, while it might bring relief to some locally it will be a far increase inflected on individuals and those far beyond these borders. I ain't ask yourself while places I love and I had the strength and privilege to visit I don't want my paintings to be near elegies to beauty to the beauty loss.

I see climate change, the lake, I saw the surrounding conifer forest turning from deep green to a dying gray. I have no words on how it tracks my heart for this slow death. And the tear of the forest and flames. The error has been on how soon we would see such catastrophic effects and I also member a time we got along fine without plastic. And flying across the immensity,[emotional speech] we do not need more of it. Now with this smoke and almost encircling the earth, we must have the vision to see you to a route that must slow this mountain of disaster. Not further exacerbated. I know we have the ability to find a better way forward. For the sake of our children, security and future, I call on the Department of ecology to reject the refinery instead their every resource into renewable energy sectors Thank you

Bill Kirkland

>> Okay I am Bill Kirkland, is a resident of the Pacific West, wildlife photographer and outdoor enthusiast, I treasure the Columbia River. My wife and I raised our kids hiking in the nearby mountains and windsurfing on the Columbia. Unique treasure was special value in the world of the missing wild places. When I read about the proposed Kalama gas and refinery plant I was extremely concerned about the welfare of the surrounding environment. I thought it would be destructive healthcare gas emissions at a time when our planet could not afford more fossil fuel investment. What? The negative emissions would impact the environment and people from British Columbia of Washington and beyond. In addition local indigenous communities will be harmed by greenhouse gas and included water caused by for acting, the concerns are being repeatedly ignored and this moment of racial reckoning nationwide we should seek to stop further injustice. I'm also concerned that this foreign owned company has no appreciation for our land, water, wildlife and local people. Our resources should not be compromised for a quick profit.

Once the damage has been done we are the ones left with the mass. Were scientists have warned we are a critical climate point. For all the reasons I urge the Department of ecology to redact the permit. Thank you.

Alice Shapiro

Please do not assume that our energy future depends upon fossil fuel use. Solar energy is becoming very affordable and is a good solution for future energy needs.

(NWIW) is trying to build the world's largest fracked gas-to-methanol refinery in SW Washington. It would cause millions of tons of greenhouse gas pollution, use millions of gallons of water from an aquifer connected to the Columbia River each day, pollute the air with cancer-causing emissions, and pose safety hazards during an earthquake. The refinery would use more fracked gas than all the gas-fired power plants in Washington, combined. And the refinery would induce new fracked gas pipeline expansions throughout the region.

The proposed NWIW methanol refinery would cause millions of tons of greenhouse gas pollution each year, for 40 years. This will put my grandchildren, great grandchildren and all species with whom we share this world. Ecology's analysis demonstrated that the project would produce 4.6 million tons of carbon pollution each year, or more. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C.

This would be the world's largest fracked gas-to-methanol refinery. It would cause millions of tons of greenhouse gas pollution, use millions of gallons of water from an aquifer connected to the Columbia River each day, pollute the air with cancer-causing emissions, and pose safety hazards during an earthquake. The refinery would use more fracked gas than all the gas-fired power plants in Washington, combined. And the refinery would induce new fracked gas pipeline expansions throughout the region.

We cannot afford to risk the future by making unwise decisions in the present. Please be more far-sighted and deny any permits for this fracked-gas refinery. These young girls are seeking a livable future. Don't let them down!

Jared Howe

I fully oppose this project and asked that all steps be taken to stop it.

Derek Benedict

Can we please move beyond fossil fuels in our state and deny the Port of Kalama methanol project?

WA State doesn't need the ensuing pollution or be complicit in sending this toxin overseas where it will be used to create more plastic.

Randall Kuhns

The increase in greenhouse gas emissions is too great. This facility should not be permitted.

Shari Goss

In this time of crisis the last thing we need for the planet is more greenhouse gas emissions. It is insane to even consider building a methanol production plant and storage facility. Science has spoken. Mother Earth has spoken through uncontrolled fires and hurricanes. I can only hope we learn before it is too late for our children.

Re: Northwest Innovation Works "NWIW" Kalama Methanol Facility

Dear Ms. Bellon and Mr. Lund,

The Port of Woodland Commission wishes to provide their comments to the Washington State Department of Ecology's second supplemental environmental impact statement released on September 2, 2020. The Department of Ecology has focused the information of requiring this supplemental to address Greenhouse Gas impacts to Washington and the world. It is understandable that construction of any type of industrial facility will produce some sort of negative impact but it must have as equal to the impact of the positive job creation, the net loss of global Greenhouse gas emissions and fiscal impact to the community, the state and our country.

If Washington desires to improve the world's environmental health, it must do so by setting an example through the permit approvals of approved cleaner and sustainable alternatives to those fuels, like coal plants in China. The Northwest Innovation Works plants will improve the global environmental impact. Approving such a project may lead the world into a greener alternative, setting an example to the Governor's environmental policies. By not approving this permit, Washington State provides no guidance for alternative commodities like proposed by NWIW, allowing traditional commodities to continue in other nations, furthering global impacts.

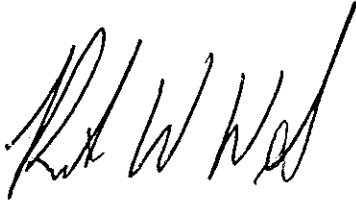

As a neighboring Port, we have addressed these concerns in two resolutions by taking a stance of coal and other fossil fuel commodities to not be considered on our port property. Kalama's facility is only 5 river miles away from our closest property, so this project does impact the Port District and potential development on our properties.

The Port submitted a letter in December 2019 opposing Department of Ecology's statement of conducting this draft supplemental impact study. This project became unnecessarily political and, over the last year, we have seen this continue to impact the national political arena. Job creation should not be political. Providing a means for families to support themselves should not be political. The permitting of this facility should not be political and should follow the state's SEPA requirements and NWIW has met those conditions. Bottom line, this plant will displace coal-based processes in China, and addressed

each and every issue pertinent to their operations on achieving those goals of the state to confront climate change through improved technology and energy. Innovation in fuels is a growing market and has to be embraced to replace traditional fuels like coal that have a more detrimental impact to our environment. We hope that the State Department of Ecology will approve these permits and allow NWIW and the state of Washington to be a global example for the future of all industrial development opportunities.

Sincerely,

The Port of Woodland Commission

Kalama's Fracked Gas Methanol Refinery would be a terrible mistake on a world level

My name is Marilee Dea. I am a retired public health Nurse Practitioner, I worked for Multnomah County Health Department.

I am living on the coast in Beaver, Oregon now. Beaver was between two fires, the Otis fire by Lincoln City and the Bay City fire by Tillamook. The town of Otis is gone, demolished totally by the fires, as was Talent, Phoenix and much of Clackamas County. 48 fires occurred in Oregon and Washington last week. It could happen to Kalama and the methanol refinery just like it did to Otis. It is possible. Who would have ever thought that rainy coastal cities would catch on fire, but they did. What would happen if the largest Methanol plant in the world caught fire? It's Green House Gases (GHG) could be a disaster on a world level.

Why did these fires occur? It is not the usual suspects - arson, lightening or carelessness, but abnormal, long, dry hot weather with 2 days of 50 and 60 MPH gusting winds, causing trees to fall on power lines and transformers that burst into flames and with the winds spreading the fires, making it impossible for fire fighters to fight them head on.

What caused this odd weather in the Pacific Northwest? NOAA, meteorologists and the governors of Washington, Oregon, and California agree that it is global warming that is causing temperatures to soar around the world and sparking these fires.

Global warming is primarily fueled by atmospheric carbon from fossil fuels. The Kalama Methanol Refinery will be the largest GHG emitter in Washington, it is dependent on fracked gas, one of the worst fossil fuels, particularly because it leaks methane. Methane is 80 times stronger in GHG's than Carbon Dioxide (Co2). Listen to the scientists and our governors who are calling for a halt to new carbon emitting fossil fuel projects and move to renewable energy - for a livable world for our children. Stop the Methanol Refinery project and help us have a greener future.

Kalama Methanol Refinery is a mistake, and our fires are not the trees fault.

marileedea@comcast.net

Vanassa Lundheim

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Lorana Leeson

The product would add to the destruction of global environment that will kill humans. Do not permit.

priscilla martinez

We need to take better care of what is left of our environment, for people, wildlife, and marine life.

Michele Trickey

Hi, my name is Michele Trickey, and I'm an Amazon employee in Seattle. I studied atmospheric physics in a prior life. I'm perturbed by the way the SEIS underestimates methane leak rates (I've seen 3% used as a conservative figure, and as much as 10% in some locations). I wasn't a healthy kid -- I lived in Southern California, and the smog made me sick. I had sinus infections such that I never wanted to play, only to cuddle up and read. The smoke this summer put me back in that place. I don't want that for my children. I know it's tempting to see this project as "better than them doing it elsewhere," but in the end, it's more fossil fuel infrastructure incentivizing more leaky pipelines and setting us farther back from drawdown. Please include more accurate leak rates in the final SEIS.

Don Steinke

The world has changed a lot since the idea for Kalama methanol was imagined.
Concern over plastic pollution has stimulated bans for certain types of single-use plastics.

And now California has passed a bill to require that soda bottles contain 50% recycled content. When California leads, others follow.
<https://www.mercurynews.com/2020/09/25/california-passes-first-in-nation-plastics-recycling-law/?fbclid=IwAR254gBhaZ3ldGih401vhWMDP5hhhO8kp8LncXhK2xnipS1o7c-f4zJ1kwY>

Therefore, the market speculations in your DSEIS should be discarded. Stick with what we know and get answers to what we don't know.

Don Steinke

The climate argument for building the Kalama methanol refinery assumes that China would not adopt more progressive climate policy.

China's pledge to go carbon neutral by 2060 obliterates that key assumption.

Ecology, reject this misguided, climate-wrecking fracked gas export proposal.

Sara Cate MD, MPH

To whom it may concern,

I'm strongly opposed to this proposal. We have a climate crisis and this is in direct opposition of the direction we should be going as a state and country. "The proposed NWIW methanol refinery would cause millions of tons of greenhouse gas pollution each year, for 40 years. Ecology should deny the Shorelines permit for the refinery. Ecology's analysis demonstrated that the project would produce 4.6 million tons of carbon pollution each year, or more. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C."

Anna Doty

>> Thank you for taking comments today. My name is Anna Doty and speaking on behalf of Washington environmental Council-- today to reject the speculative analysis as a basis of evaluating to Clement impacts and deny the shoreline permit for the energy for the facility. This does make some improvements by partially adjusting unrealistic the low leakage rates and finally acknowledging the likelihood that methanol produced by this facility will be used as trance rotation fuels. Despite livered efforts by Northwest innovation works to mislead your agency and the public otherwise. However the mitigation and displacement analysis is deeply concerning and is misleading and speculative and unenforceable a Sumption about this project. Dangerous to presume this analysis can accurately predict consumer behaviors or regulations for the coming four decades. The SEIS provides to do little detail on the actual mitigation that would be accomplished within this involuntary remark. Nor does it-- emissions overseas occurring. Also an X-Acto to use mitigation as a tool to simply maintain the status quo while we continue to build out the fossil fuel industry. We know that is us as usual is not-- even with all of these flaws, this announces and confirms this facility was still be become one of the greatest sources of pollution in Washington. Is unacceptable to build in a Norma's polluting facility based on speculated analysis and you should dismiss the speculative idea that this could displace even more polluting facilities and what is reasonably foreseeable and in fact assured about this project which is that it would cause millions of tons of greenhouse gas pollution each year for 40 years and inconsistent with the achieving of our climate goals.

Bill Sampson

>> Hello my name is Bill Samson and I'm calling in from Seattle and thank you for the opportunity to testify today. I have a lot of concerns about this project and I want to say first but I would like to everyone to have access to a good job and clean air and clean water and to be healthy and safe so I think fossil fuel industry, whether coal, oil, gas, it's not the way to do that but renewable energy is growing and it is the future and the projects like this, they increase instance of murdered and indigenous women, a lot of pollution and this project in particular and energy consumption is a monster and take a lot of water out of the Columbia River, this is already extremely polluted and-- extension. These are worthy indigenous people want to stay and a very important part of the-- economy for nonindigenous people as well. I have a lot of concerns about assumptions like it seemed like a gas industry report copied and and saying-- definitely for 40 years without any changes throughout the regulations and that this project is clean and the other guests will not be clean. And that all fossil fuels dash mac my time is almost up. Thank you.

Adam Davis

>> Good afternoon everyone my name is Adam, I lived in-- County and reside in Castle Rock with my wife and three children. I served the Western side of the state as a union rep for the local-- vendors, I have been involved and interested in this project for about six years now. During that time NWIW has continued to meet the requirements to obtain the necessary permits for this project. A lot of conditions they have far exceeded that as well. For example the projects incorporation of the 0 water discharge in the design and commitment to mitigate for 100% of emissions first day of Washington. The year-long review included the project will most likely result in reduction of 6 million tons-- carbon emissions globally. That is twice the amount of carbon emitted from the city. Some have chosen to ignore the benefits this can bring. I would say it does not stop at country's borders or state lines, in addition to this plant having a net reduction in GHG's globally there are a few benefits we will see as well such as 1000 plus local family with jobs during the three-year construction phase. And nearly 30 to \$40 million in tax revenue. I encourage you to put Washington on the map and to help decarbonized Washington and I urge you to approve the spinal permit. Thank you.

Ecology has taken an untenable and indefensible position by saying that this project— although it will put over the limit amounts of GHG into the air could be worse— and compared to could be worse it's ok. This has even high school ecology students thinking this is a win win project for Kalama and testifying so in the hearings.

Ecology has put all its eggs into that basket and I'm concerned that Ecology will dig its heels in and double down on that analysis rather than face up to the error of its ways. I'm concerned Ecology will let this get personal the way the Kalama community has gone on this project.

The key underlying assumption for Ecology's so called displacement analysis justifying this project is that China will not change from its path of coal. With unwavering commitment to coal in China, Ecology posits that there will be one less coal sourced methanol plant in the world, and since the demand for methanol will also be unwavering for 40 years that seals the deal.

In the September 23, 2020 New York times "China's Pledge to Be Carbon Neutral by 2060: What It Means" , <https://www.nytimes.com/2020/09/23/world/asia/china-climate-change.html>, President Xi is quoted: "Humankind can no longer afford to ignore the repeated warnings of nature." There is absolutely no way to accomplish these carbon neutral goals in 40 years without running away from coal as fast as their 2.8 billion legs can take them. They will shift out of coal, they have to do so, it's clear that the writing is on the wall.

For Ecology to assume the exact opposite, that coal will be the China gold standard for energy production over the next 40 years, cannot stand the test of common sense. And with the legs of this displacement analysis shorn off that analysis cannot stand.

Ecology has unwittingly created a firestorm within the Kalama community, pitting neighbor against neighbor, high school students claiming opponents are anti science and a whole bandwagon of unintended consequences from their indefensible analysis. Change your position on this analysis, admit the errors of your ways, swallow your pride and deny this permit.

Bob Zeigler

>> My name is Bob Zigler and I live in-- Washington and commenting as an individual, I would like to comment just as a result of some of the religious communities that played on this issue. Right now there is, we are entering into a special times, special focus on care for the earth. Both in the Jewish communities with the Jewish high holy days with Rosh Hashanah starting tomorrow and New Year's continuing October 4 and Catholic and Episcopal Lutheran communities from September 1 in until October 4th in a season of creation and looking at what we can do to protect this. I would like to point out, there is Pope Francis, and announcing the season of creation, climate restorations utmost appointments since we are in the midst of a climate emergency we are running out of time as our children and young people have reminded us. And strengthen regulation of the activities of extractive companies to ensure justice for those affected. Especially indigenous communities. I would also like to point out that I have great concerns over the mitigation proposed. Because it says mitigate hundred percent, the is more of a wish and a hope then I guarantee. There is no way to guarantee it will be the political will to do this. There will be funding for staff to do this. And this will actually be happening on the ground. And also the requirement that the mitigation be cost-effective. Really limits what can be included. I would like to close with statements of Pope Francis. Which dash mac said strategy of buying and selling carbon credits can leave a new form of speculation which will not help, reducing emission and gases worldwide. And providing a quick and easy solution under the guise of commitment to the environment. And whether a ploy that permits employing some countries and sectors. Thank you.

Carrie Parks

>> Thank you my name is Carrie parks MA third generation Washington and I have hiked, camped and then in all parts of the state. The smoke reaching an uncontrolled forest fires, lungs burning, though it's scratchy, eyes an unusual event. Because of the fires it is unsafe to be outside and because of COVID is unsafe to be inside. This is the beginning of a new normal. The destructive effects of climate change are here now and only going to get worse. This is the third fire event in four years and in Vancouver we had as an smoke in both 2017, 2018 and now again and 2020. Wildfires are decimating Washington, Oregon and held for you. Smoke covers the entire western half of the U.S. and thousands of miles out over the Pacific ocean. I asked the park commissioners of Kalama are the jobs more important than those who have lost their homes, animals, jobs and even their lives along the West Coast?

Is your dream that great? Ten percent of or God z entire population has had to evacuate from their homes. Millions of acres have been scorched in Washington. If you allow this methanol went to go into this is the future you are locking your children and grandchildren into forever. This is not mitigatable. Deny the shoreline for this plant. Don't let them build it.

Camilo Marquez

>> Hello I lived in a pristine area that was part of the watershed of New York City and I came out here believing that those kinds of conditions would be available to me. Right in the heart of the metropolitan area. In Portland. But since I have been here, we have seen a number of events where the threats to the environment have been impossible to avoid. It is literally in the air. The air that you breathe floating down in the form of ash so given what we know about of what are the consequences of climate change in the fact we have seen severe consequences. It's hard for me to imagine how we can consider this kind of a project that would continue to contribute massive amounts of greenhouse gases and the events that we are suffering with today due to climate change, we knew about. And we know what will happen if we do not reduce the amount of greenhouse gases that we're producing. At this point we will add 4.6 metric tons annually for the next 40 years. The arguments for it, the arguments that justify it really are speculative and strike me as being speeches. So I ask you humbly to reject this request for permanent. Thank you.

Oregon Conservancy Foundation

>> I name is Catherine Xavi I'm speaking for the Oregon Conservancy foundation. We are experiencing immediate devastating impact of catastrophic climate change right now where we live, work and play. It is ironic that public hearings on this proposal are being held just as we are forced by claimant fires to closet indoors and breathe the most hazardous air in the nation into our lungs. The only way we can protect our region from the increased frequency and these destructive climate fires and toxic air pollution is to keep fossil fuels in the ground. Despite of the elusive Rosie picture by proponents and speculation, not fact, that conjectures unsupported conclusions about reducing mobile emissions sometimes in the future, your SEIS makes clear the operation of this facility will in fact pump 4.6 tons of carbon dioxide pollution for the next year and for the next 40 years into Washington. This is simply unacceptable at every level. Claiming this company with a track record of lying to those in the public, is not worth the paper is printed on. The mitigation promises a house of cards and toxic as the air we breathe and the aftermath of reaching claimant fires predicted to grow worse over time unless we set policies and make decisions that direct us away from fossil fuel facilities like this 1 this facility sentences our children to decades of adverse cost that you cannot ask them to bear. The Conservancy foundation teaches you to carefully examine the climate facts and not speculations in your own analysis. And ask that you deny the shorelines permanent and ultimately reject this refinery for the health, safety and long-term well-being of our children and the survivor of biological support systems on the planet.

Craig Heverly

>> My name is Craig have really, I am 82, however you decide this, probably not affect me very much. My time is short. But I have three young grandchildren living in Tacoma, Dixon and-- speaking with them on my mind and on my heart.

They are just starting out in their lives. And your decision have huge impacts on those lives. And to start pouring carbon into the atmosphere, we have a hope of something close to a livable planet, this project is 180 ° in the wrong direction in the name of my grandchildren I ask you to turn it down. Thinking of them something else, looking ahead a time all come when either the supply of gas or the demand for methanol will dry up Northwest innovation works will make the business decision to sell or declare bankruptcy and disappear. The jobs will be gone and the people of Kalama will watch this huge Hoke standing on the shore rest over it fall apart.

The damage will be done to the town, to the river, to the water table, to the land, to the environment, to the air into the planet. And who is going to pay to clean up? Certainly not Northwest innovation. No. It it will fall to all the rest of us.

Were a criminal diversion of tax dollars that would be when we could have stopped it right here. In the name of Viola, Dixon and Eula, I am asking you all to turn down this.

Government Council

>> My name is Bob Gregory I'm a resident of-- County, government counsel, I've seen and been involved with many different job creating projects close to-- County. The findings with the another project, it concludes it is time to permit the Northwest innovations project in Kalama and allow the county and comma in a tease to return to the economic vitality we have lost from the jobs that have occurred at warehouse or, fiber and the closure of-- resulting in the loss of 1000 jobs for after this project by the Department of ecology and using the most conservative approach, these examinations again clutter to conclude that the project will reduce greenhouse gas emissions equivalent of twice of what the entire city of Seattle produces each year. Emits each year. Even so Northwest innovations has committed to fully mitigate all the greenhouse gas what emissions in Washington and increase our global benefit. This project is one of the most environmentally sound new projects proposed in the past decade with examples such as 0 liquid discharge, traffic impacts, no solid waste and air emissions at the Southwest pollution control levels. It's time we conclude ambiguity and moving targets in the determinant of ecology to accept its own environmental impacts city and approve the permit. For the state of Washington.

Columbia River Keeper

Hello my name is Dan Sears and the conservation director with Columbia River keeper. I want to make three per main points today. First the climate methanol refinery would be a main source of rain house gas pollution. It mistreats the project would produce 4.6 million tons of greenhouse gas pollution each year. 1 million tons within Washington State along.

If all of it is combusted for fuel the number is higher. If ecology uses more numbers for methane leakage is higher. Regardless the impact would be staggering at a step from the worst impacts of lemon change.

On this basis ecology should deny the project. Secondly, every fossil fuel company has tried to claim that is other than coal or some other fossil fuel. This is a false standard.

Millennium coal try to claim cleaner coal but no one Sears I thinks shipping 44 million tons of coal would help the claimant. And trying to ship lower carbon oil but no one actually believed that shipping printer safety thousand barrels of oil a day would help the climate. Ecology will be setting a terrible precedent by allowing Northwest innovation works to claim that it would be doing anyone a favor by using shocking 320,000,000 ft. ³ of Frak aspirate date and belching millions of tons of climate pollution into the atmosphere and dumping methanol into a global arc it for decades. Third, the green economic appendix does not support conclusion that Northwest innovation works methanol would direct late displacement coal based methanol. Stating within China there is likely a preference for expanding domestic production were feasible, expanding low-cost ethanol is excited to make up the largest share of the methanol supplies in the coming years. We cannot control the decisions of other nations or predict 40 years of market shifts, technology improvements, payment policy or trade wars. The only reasonable, foreseeable impact of this project is massive pollution. Thank you and we will submit our comments in writing.

philippe letourneau

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Keith D'Alessandro

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

George Bourlotos

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

carrie Foster-Campbell

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Richard Johnson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Janet Wynne

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Arnold Strang

THIS WILL REQUIRE A WW2 SCALE EFFORT!!!!

WE HAVE TO GET THIS RIGHT OR ITS ALL OVER!!!!

WE ARE OUT OF TIME!!!!

NOTHING IS MORE IMPORTANT!!!!

Climate change is an existential threat to human civilization if not humanity itself. We are out of time. The top climate scientists tell us that if we haven't controlled our green house gases by 2030 climate change will be IRREVERSIBLE. THE END OF HUMAN CIVILIZATION!!!! As it stands, we will already experience severe effects because there is so much inertia built into the system. There are many positive feedback loops already in progress. Reversal of climate change could require hundreds of thousands of years, far longer than modern humans have been on the Earth. This will not be easy!!!!

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Phillip Norman

It is purely evil to pillage North American wilderness, forever ruining its habitability. This is in disdain for present inhabitants and those in the future needing habitation on a hotter planet. The grab is merely to enrich a few greedy investors and those witless on their "fund" coattails. Stop the madness, now!

The future of life on Earth must trend better, not worse, as planned in cities of more-progressive China (<https://www.c40.org/researches/constructing-a-new-low-carbon-future-china>). Don't foolishly accept that export of stolen methanol to China makes any sense.

Susan Schmidt

And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Coleen Anderson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. We are a decade past due to begin to build a sustainable infrastructure for the future. Biden will start to provide green jobs and build it out. Don't take us backwards to the danger of a climate crisis, but keep it in the ground!

Greg Goodwin

It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Shauna Boyd

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Lloyd Hedger

One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIWs emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this projects impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIWs proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washingtons climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIWs proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Desiree Nagyfy

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Joseph Lawson

Subject: NORTHWEST INNOVATIONS PROJECT - A "WIN-WIN"

Name: Kurt Sacha

Home Address: 2337 E. Lynnwood Dr., Longview, WA 98632

How long lived in SW Washington: 62 years

The Northwest Innovation Works (NWIW) proposed methanol project is a "win-win" for Cowlitz County and the State of Washington. Not only will this project employ 1,000 workers during construction and 200 to operate the facility upon the completion of construction, the investment in the NWIW project provides a much needed boost to a struggling Cowlitz County economy. NWIW's tax contribution to Kalama schools, Kalama Fire District #5, the City of Kalama, Cowlitz County and the State of Washington will be significant and will provide a strong foundation for successful programs for generations to come.

Better yet- the NWIW project provides for the first "Zero Liquid Discharge" system on the Columbia River and the removal of 9.7 to 12.6 metric tons in climate change-inducing carbon dioxide annually. This facility protects the Columbia River system by recycling 100% of the plant's wastewater and provides for a significant positive impact on global greenhouse gas emissions- the equivalent to removing approximately 2.2 million cars off the road.

Positive environmental benefits! Positive economic benefits! A "win-win" from every point of view. I urge you to please support this project.

Kurt Sacha

Andrea Faste

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Daniel Villa

Dear Mr. Doenges,

I was outside with the Protectors of the Salish Sea when they asked you, pleaded with you, begged you, to help stop fossil fuel expansion here in Washington State. To protect us and the future for our descendants. And you replied that we had the same goals, that Ecology does want to do that.

So it's confusing to me when I see an SEIS from Ecology that acknowledges the climate damage that the proposed methanol plant will cause in the first half then sings its hypothetical virtues in the next. How can the alleged benefits of a facility be based off of theoretical displacements of other fossil fuels, and their methods of use, that are far from being under the control of Northwest Innovation Works, Washington State, or even the USA?

How does this proposal fit into Washington State's own goals and obligations of reducing our local greenhouse gas emissions? I understand this plant would increase our state's emissions by 10% alone. The proposed facility will be a blight on the small town of Kalama, the Colombia River, the state of Washington.

Where will the enormous quantities of methane for this project originate? Up in Canada where the industry's self-reported leakage rates are allegedly lower than here in the US? Studies have shown that the natural gas industry is leaking from every possible place along the fracking, distribution and end-use chain. It's a climate disaster.

I understand that another pipeline would have to be built across the state, north to south. Are the climate impacts of building this pipeline taken into account? How much will that pipeline will leak? What habitats and waterways will it obstruct and damage along the way?

I don't have to tell you how much worse methane is as a greenhouse gas than carbon. Or maybe I do: at least 86 times worse over a 20 year period. Twenty years. Twice as much time than what the last Intergovernmental Panel on Climate Change report says we have left to move swiftly and radically away from fossil fuels. Yet if you approve this gigantic methanol facility it will be moving in the exact opposite direction of where we need to be going, and for forty years nonetheless, the anticipated life expectancy of the facility.

So once again I will ask you, plead with you, and beg you to use your power to put an end to this disastrous proposal once and for all.

For a better tomorrow,

Daniel Villa

Cheryl Henley

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Larry Maes

M Aufrecht

Stop the Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama. NWIW's proposed facility would be enormously polluting in Washington State.

The argument that If we don't build it, someone else will, is a terrible reason to move in the wrong direction. Now is the time to remove fossil fuel infrastructure, not build more. It is time to urgently address the dangers of climate change by investing in alternatives.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Derek Gendvil

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Emily Van Alyne

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Thomas Diener

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. Coleen O'Brien

Today, as I write, the skies above me are smoke filled and the sun is an unfamiliar orange/red orb in the sky.

Methanol is poisonous to our environment. A new facility in Kalama is another step away from an environment that will support human life.

Please, please! Do not allow this plant or any similar environmentally destructive facility to be built in our state. Or anywhere!!!

Bryan Branson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Irina Clark

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

AIXA FIELDER

Larry Maes

Having successfully witnessed the stopping of the coal export facility at Cherry Point in Whatcom County several years ago, I can certainly empathize with the opponents of the Kalama Methanol Project. Specifically, the manner in which the environmental impact of the project has been grossly understated. I appreciate that the second EIS was initiated and recently completed, especially knowing the first was in some manner, funded by its proponents. Let's not lose sight of the simple facts regarding this project. Our environment can no longer withstand one more mega fossil fuel contributor. Can't imagine Washington State would even consider such a project. As a lifelong Washingtonian, I'm proud our state has strived to become a leader amongst all other states in its environmental concerns and actions. To approve this project in any way would be a grave mistake and damage the accomplishments our great state has made in the fight to safeguard our unique ecosystems and battle with climate change. Jobs created in this state should be for renewable, clean energy only. The proponents arguments for this project are thin at best. They are misleading and do not take into account the long term effects this plant will have on our state, but more important, our worldwide impact as a whole. Look southward to our neighboring states of Oregon and California this year to witness the devastating effects that this plant would certainly contribute to. I appreciate the opportunity to comment. Thank you.

Larry Maes

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Summer Stevens

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Tracy Ouellette

The proposed methanol refinery is not consistent with the state's commitment to the absolute need to reduce greenhouse gases in order to preserve our environment for future generations.

The proposed NWIW methanol refinery would cause millions of tons of greenhouse gas pollution each year, for 40 years. Ecology should deny the Shorelines permit for the refinery. Ecology's analysis demonstrated that the project would produce 4.6 million tons of carbon pollution each year, or more. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C.

The SEIS relies on a flawed, speculative analysis to argue that methanol could "displace" dirtier energy. The SEIS speculates on how methanol may compare with future, unsure, alternate sources of pollution in overseas markets. The SEIS makes a false and erroneous comparison with potential future other sources of methanol or olefin production. Rather than engaging in this speculation, Ecology should focus on the real-world, known pollution that will come from the facility rather than NWIW's dubious "displacement" argument.

Burning methanol as fuel would generate millions of tons of pollution each year. In 2018 and 2019, NWIW informed potential investors that methanol from the planned refinery could be burned as fuel overseas, in sharp contrast to claims NWIW made to local and state regulators that the methanol would only be used to manufacture plastic. Now, Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year. Combustion of the full methanol production capacity of the plant would generate 5 million tons of pollution each year.

As a physician, I am concerned about the impact of this facility on our health. The Proposed Facility would be devastating to public health in the following ways:

1. Fracking pollutes water systems, and causes physical harm from earthquakes and the devastation of surrounding habitat.
2. The pipeline required to transport fracked gas has a high risk potential for leakage and spills, releasing harmful chemicals into ground and surface water.
3. On-site operation of the facility would pollute the Columbia River and its tributaries with harmful runoff, and contribute to reduced air quality leading to increase instance of asthma and other respiratory illness.

Thank you for your consideration of these issues. Please protect our future!

Sharleen Mehemed

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Elizabeth Casanova

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Andrew Waters

The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jessica Ostfeld

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents far too few important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise.

Its basic assumption that China will use the methanol for plastics is flawed since the Chinese already have ample supplies designated for plastics production. Also the report largely ignores the pollution that would result if plastics are burnt to produce electricity.

Another staggering deficiency is the assumption that China will burn fossil fuels no matter where they come from, that if we don't ship ours to them, they will just purchase them elsewhere. The Chinese are rapidly diminishing their reliance on coal and gas. They are turning to green energy faster than we are.

And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. Comments on Ecology's review of SEIS for Kalama Methanol plant

I am a retired Aerospace Engineer living in Longview, WA. In my view, little has changed since the original SEIS and The Department of Ecology's review. Looking out of my window at the smoke and fog makes me wonder why there is any debate on whether climate change is occurring. And, why projects like this one is even being considered. We all know this project and its product will increase the release of Methane into the atmosphere. Below is a summary of some

Methane/Methanol facts:

1. Methane is 20 to 25 times worse than CO₂ in absorbing heat in the atmosphere (per Howarth, et al from Cornell University).
2. Methane emissions are increasing as CO₂ is declining.
3. Methane emissions due to fracking are increasing and is approximately 60% higher than the EPA estimates that were overlooked due to emissions occurring during abnormal operating conditions (from Alvarez, et. al).
4. Methanol stays in the atmosphere for 10 to 12 years.

Therefore, the largest effect on climate changes due to increased temperatures in the next 10 to 20 years will be from methane. Nature does not change in nice linear ways as observed by earthquakes: stress builds up and reaches a "trigger point", causing an earthquake. Likewise, climatic effects can happen in the same way. Rise in temperatures in the next 20 years can hit a trigger point relative to methane releases in the atmosphere currently stored up in the higher latitudes in the permafrost. Already, thermokarst lakes are forming due to warming and releasing increasing amounts of methane. This scenario will have a spiraling effect on climate ♦ more heat equals more methane released and more methane equals more heat. The SEIS overlooks these types of effects on methane released into the atmosphere.

It appears the SEIS underestimated the release of methane due to fracking. A paper by Sangita Bista at the Murdoch University in Australia states that the GHG emissions resulting from development of Western Australia 5 onshore gas basins using fracking would be equivalent to all the Australian emissions sources combined at 2014 levels each year for 20 years.

The SEIS makes a major assumption. It assumes the current use of coal to process olefin in China will be replaced by methane in the next 10 years. This is just a wild guess as to what actions will be taken by the Chinese Government and what changes will happen in the marketplace. We all know that the methanol produced in Kalama may also be used for fuel. This fuel will be used to support factories, etc. resulting in more emissions.

The Ecological review has not been complete in my view. It has not addressed the problem of more olefins production and what happens when those plastic products are discarded by the consumer. We all hear about micro particles of plastic beginning to be detected in our fish, water, etc. This is also an environmental challenge.

How can any responsible person or organization approve of another project that will negatively degrade the environment. The rationale for the project is to produce a few construction jobs, that will not last long, and then very few operational jobs? With most of the financial burden being assumed by the citizens of Washington state and the United States in order to develop the manufacturing factory for the Chinese!

Pat Gudowski

If this involves fracking I am totally against it. They did this, among other areas, in Iowa several years ago & my daughter is still buying bottled water for consumption..not from her faucet. It is so damaging to our environment & resources as well. I would vote NO. thank for the opportunity to be heard.

Carol Whitehurst

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Julieann Palumbo

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Teresa Flynn

My husband and myself are residents of Kalama, Wa. Our residence is just uphill from the proposed Methanol refinery. This is a totally inappropriate location for this project small acreage on the banks of the Great Columbia River, would be built on dredge spoils, that would liquify as a result of earthquakes. Thank you, for the work protecting Washingtons Environment. No Kalama Methanol Refinery !
Teresa Flynn Kalama, Wa

Penelope Ward

And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Ronald Yeomans

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Cameron Wilkinson

>> I'm taking this to menace to talk about my support of this project. And my disappointment in the constant change in expectations of these companies that are bringing transitional fuel to the state of Washington. And it seems like every year we continue to make things more extreme for them to meet the requirements to build these projects and we don't look at the science, we just do scare the communities with facts that are not, coming up with facts that are not true. Just false facts that organizations are giving out there. And this project will be a great opportunity for Washington state to produce feedstock, to better clean our climate will bully.

For manufacturing up things we all use every day. Plastic, it's in everything, our clothing, a goes down medical supplies, everything. So I am just more or less as a citizen of Calais County I'm getting very frustrated with setting the bar constantly and the other issues of the production of methanol for the forest fires, things like that. This has nothing to do with this project for forest fires are happening because we have changed regulations on the forest to clean them up. And mother nature is taking care of the problem. I just want to end with that, I support this project. Thank you.

Deena Grossman

>> Thank you very much I am Dena speaking from Portland Oregon, less than 35 miles from Kalama, Washington. Thank you for taking public comments. We can't breathe. This week, the letter to President Trump saying is time to abandon the disastrous course that now envelops us in spoken aspect deliberating the size of action to slow climate change must be taken on a global scale with the U.S. in the league. NWIW, SEIS tries to whitewash the issue of greenhouse gas initiatives exceeding 40 million tons per year of the proposed Kalama methanol refinery. The numbers against the larger enormous imaginary numbers for a plant will elsewhere. Saying if you don't let us build us here our corporation or another one will build a worse polluter elsewhere. The insistent has to be built and they are wrong it does not. NWIW, a Chinese government fossil fuel Corporation would become the single largest greenhouse gas polluter in Washington. Please, people of the Department of ecology, lead us to a future of clean air we can breathe. Cool, clear water, driving forest and healthy communities for your sake and for all of our to learn and grandchildren. These take the path to reducing greenhouse gas pollution and take your own mission statement to heart. Protect, preserve and enhance the environment for current and future generations. Oppose actions which will intensify the environmental segregation of our beloved Pacific Northwest. And deny carbon for building the worlds largest methanol refinery in Kalama, thank you sincerely for your attention.

Diane Dick

>> Thank you I am Diane Dick and a resident and setting the project for years. This would be one of the largest in the world. And told me personally it was because many pollution control centers would be too costly with CR and cheaper to take the electric power from the public grade.

Information in the air discharge permit, this refinery has the capacity to admit over 1 million metric tons of GHG's every year just on the process site. And NWIW states they will mitigate all in-state emissions and first priority will be given to projects in Tillamook County, please give us specific examples of the mitigation projects and their ability to sequester greenhouse gases from the atmosphere. The only viable way to remove CO2 from the atmosphere is by growing trees or crops. According to the EPA greenhouse gas calculator it would take 1,306,000 acres of forest land to remove 1 million tons of this in a year. It only comprises of about seven hundred forty six,000 acres. There is no way I and the NWIW will be able to mitigate the infractions and this county or all of Southwest Washington. Demand accountability for a real plan now because you surely won't get voluntary compliance later. Let NWIW one more company that tries to buy its way out of--

Clay Dennis

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

The people who feel the need for this project should build that facility in their own back yard not in

the place that people have enjoyed life without pollution for however many years. Better still, build it at Mar-a Lago.

Don Steinke

>> My wife and I are using the same computer and she will testify after me. I am a retired science teacher, 40 years mostly at Vancouver I with the, it had been difficult to get all the states related to a proposal. Maker requires you to prepare a whole EIS that tells us the truth and nothing but the truth. But it gave us only part of the truth the law of speculation. I'm not even sure you read your own EIS. Did you write it? Where the remarks about this placement potentially your own? Or did they come from the proponent? Natural gas industry is the absolute master of deceit and lies. They persuaded us that most plastic is recycled.

Where it is not. They are advertising on TV and Facebook right now about the pathway, their pathway to the clean sustainable future. And all the emissions are accounted for, gases nearly as bad as coal and ethanol is worse. Methanol is the opposite and it is a pollution added product. That are to use the fuel at the source then to add the illusion generated by a methanol plant. The gas industry has known about climate change for decades. What has engaged in the campaign of deception to help sell the products. They have fooled most of the public and elected officials. Pulled the green groups as well. Until we learned about methane leaks in 2014. And out trying to full you with the displacement theory. Don't believe anything they say and get rid of the speculation and the EIS and protect the future and say no to the destruction. Now my wife who is registered to speak.

Elizabeth Shepherd

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Alana Steinke

>> Good afternoon. Name is Alina Starkey I'm a retired RN, this is nothing but business as usual for the last many decades. We knew we had to decrease greenhouse gas emissions from burning fossil fuels in order to help the planet. Now our world is on fire, smoke is choking us making us sick and yet ecology is suggesting that it's okay to release millions of tons of house gases every year from just this one project. SEIS makes assumptions and speculations with no facts to support them.

Not only with this project, sickened local citizens and most likely we will be paying for it from our pension funds. The Chinese would build it and profit from it and our expense. Will they be required to post risk funds since the site would be built on fill in a liquefaction zone once it become a stranded asset, taxpayers will be left with the cleanup. There is no way to mitigate the climate harms for allowing additional fact projects and there is a bumper sticker that says climate change is just another way to burn in Hell. We are certainly getting a taste of that right now. And my eight-year-old grandson Marlon said I'm not having any and humans might even be extinct by then. That made me very sad. Because SEIS is grounded on the theory of displacement used on a speculative economic future. Your decision affects everyone's grandchildren. Please don't amble away their future. Deny this project.

Iris Walsh

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Union Workers Number 48

>> I stated my name is Garth Bachman, at the union workers number 48 in Portland Oregon on, jurisdiction covers Southwest Washington including that geographical works Kalama site.

I would like to endorse this project and this will provide 1,000 construction jobs over a three-year period of time and 200 permanent family wage jobs will be much-needed for the economy of Southwest Washington. And as the ecology report actually shows this facility will reduce greenhouse gas emissions every year. Our members and the community of Southwest Washington need jobs and need to get the economies stimulated and we are unemployed due to COVID, we need this project and this will provide good lasting jobs for many years to come while it's being environmentally from the at the same time. That's what I have. Thank you.

Iris Antman

Thank you my name is Iris dash mac I'm a resident of 30 plus years in Seattle Washington. And for the folks who have spoken in favor of this because of the need for jobs, I hear you. And being able to provide for our families. However we won't have a family if this project goes forth. Climate crisis, climate emergency is here now. And any buildout of any kind of fossil fuel project is the wrong direction and we will know this. And so let's instead turn our resources, creativity, expertise, skills, towards providing clean energy and that's where the efforts should be. Please, do not, put in fewer greenhouse gases into the air is not okay. We need to put-- thank you very much.

Bronwen Evans

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Jan Hydra Fracka Zuckerman

>> All right I am ready. Hello, I'm name Hydra after the mythological creature when one of my heads get knocked off aggro tomorrow heads and growing new heads just like the expansion of the hydraulic fracking operation [laughing] why settle for dash mac energy when they can rely on fracking to get extreme energy. Everyone knows getting gas is hard work and it isn't easy like it used to be. Really expensive, bad for the claimant, messes up the land and the skies but for a limited time only if you executives can rake in the moccasin to 40 years more on the methane gas. So what is the problem? Why shouldn't they bring forth the treasures of the earth? For example drilling, pumping and fracking chemicals releasing into the air and groundwater, permanently poisoning millions of gallons of clean water. I mean what is the big deal?

In the first 20 years in the atmosphere methane is the 86 times more effective, trapping heat than carbon dioxide. Northwest innovation won't leave any money in the ground will they? Just think this is their opportunity to generate up to 5 million tons of additional greenhouse gas pollution every year. According to them our planet can afford to burn up, I mean more gas. That is why I am here to thank you for trusting fossil fuel industry to do the right thing, ignore the science. And forgetting the green light to Northwest innovation works. Thank you.

Dean Webb

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Elijah Cetas

>> Yes I'm a member of the-- by creating millions of good job in renewable economy, the sunrise movement exist to break the false narrative that has been peddled by fossil fuel companies and the myth that we can't have jobs without watching the communities choke in pollution and smoke and burn and climate change driven wildfires. I'm deeply disturbed by the comments from the IVW representative and all those endorsing this for the promise of jobs. About the long-term. Please, think about teacher generations, please, we are choking on smoke and living through a pandemic and both of these crisis have been driven by the radical exploitation of our planet's natural resources. And seeing crop failures, or more wildfires and see more pandemics and we are discussing whether to build a project that would release more than 40 million tons of CO2 for the sake of producing more plastic which already chokes our oceans. The best justification that this company has at that it might offset call power plants years from now. We cannot rely on the false assumptions and reckless financial speculations that fossil fuel companies have shoved down our throats for decades. When right now our communities are suffering and at risk. Think about what money in our emergency services, fire departments, our ports, our clean energy jobs, with that can do in the amenities. Because the fact is we cannot continue to burn fossil fuels. We cannot continue to damage habitat and put the lives of children and grandchildren at risk for corporations in such a short term. I want to close this as Tony a sake in the chemical workers understood we need a just transition for workers. And talk about how we turn the ports into climate resilient working, waterfront, this project is not that. Thank you.

Mark McIntire

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jean Avery

>> Good afternoon everyone. I am Jean Avery, resident of Vancouver Washington. We have heard components of the NWIW project say that this refinery would be good for jobs couldn't. Why would we invite more pollution into our region for 40 years? According to Sierra Club this would consume more gas than the region's largest cities combine cap making it the largest polluter in the state by 2025. Why should this project be reconsidered at all? Especially when mitigation seems vague and minimal. The second SEIS includes more than 100 pages of graphs, tables and data. And yet there are only two pages on significant impacts and mitigation. And appendix mentions voluntary emission reduction, to the extent possible. This is a vague reference to carbon markets also. So questions remain, number one, the worlds of voluntary and to the extent possible imply that NWIW does not receive it is a firm obligation. And number two, I carbon markets does it mean purchasing carbon offsets?

This would not reduce actual emissions. Number three, does ecology have resources to oversee this project? Instead ecology could focus on proactive measures for a clean energy future. Number 4, 40 years is plenty of time to enact mean energy programs. When NWIW claims its operation is less polluting and other sources and assumes other fossil fuel sources. I believe we are on the cost of a clean energy future.

It is time to say goodbye to fossil fuel projects. Please deny this project.

Jessica Zimmerle

>> My name is Jessica Zimmerli and I'm the program and-- in my work I see faith communities across the state who are doing everything that they can make their facilities more efficient and sustainable. Currently in conversation with five congregations looking at becoming net 0 carbon facilities. We are striving to be better stewards of the houses of worship because faith across all spiritual conditions causes us to care for earth and one another. We are doing what we can but sometimes we feel like prophets crying out in the wilderness. Prophets give warnings, they read the signs of the times and call out oppressive systems of power. And assigns of our time are stark.

All you need to do is look outside at the smoke hitting the region. The climate crisis is here and the communities are hurting. Please hear the prophetic cry that it's time to move beyond fossil fuels. Current market conditions do not provide justification for investment in 40 years of pollution. If anything, 2020 has shown us that we cannot predict the future. And the only sure thing in this analysis is that this refinery will be a major looter. We don't have time for that. We do have time to change the market. Denying this comma is the first step to doing so. We do not have to way this against other dirty fossil fuel facilities that don't exist. And said based on the stewardship, justice, reflected in our state's shared climate and clean energy goals. We need you to be join us as prophets, pave the path to a low carbon future. Take the moral high road. Do what is right and reject this harmful gas facility.

John Flynn

My name is Don Flynn and I'm a resident of Kalama Washington and I fish in the Colombia River, and I'm adamantly opposed to the construction of the methanol refinery on the shore of the call be a river. Primarily on environmental grounds and secondarily on aesthetic grounds. Negative adverse impacts this project would have on our environment and health is even more critical today considering the catastrophic wildfires we are experiencing in Washington, Oregon and California with the associated loss of life of property. This refinery alone would emit 4.6 million nitric tons of greenhouse gas emissions annually and in addition this refinery would emit 53 tons of toxic and hazardous and chemical pollutants into the air per year along with 62 tons of particular matter. It's imperative we reduce greenhouse gas emissions and toxic air pollution's rather than increase them. The vapor from the tooling towers from which millions of gallons of water will be evaporated would reach between one half to 3/4 of a mile high and 1 1/2:45-mile and a half wide. I see myself fishing with family and friends in the shadow of the world's largest methane gas methanol refinery. I urge the Department of ecology to deny any and all permits for this project. Thank you.

JJ L.

>> This methanol refinery would be going 180 ° in the wrong direction. No more fossil fuel infrastructure. We are beyond that time and considering putting this refinery in one of the largest and most treasured rivers in the nation would be beyond responsible. How to say something about mitigation which is usually the quote unquote solutions NICU are talking about that here. The pocket gopher lives of that land and the brace will be annihilated by building this warehouse. By mitigating the process they will cut down a 70-acre forest in hopes gopher will take up residence there well known that the overhead is very finicky taste in the soils and habitat. And lose the 70 acres of trees and see the cooling, stormwater mitigation in the habitat even though no certainty that it will work and it probably won't. In the state of Washington allows this behavior not because it makes sense so that the corporations can continue to have the upper hand. It is business as usual. It mitigates nothing but destroys and keeps destroying. And cancels the voice of the people who decide it's time to stop living as if money was the only thing that mattered. And that those provide the jobs that we are hearing tested fires here say today that we need so badly. We have had enough, do the right thing, no methanol refinery.

Columbia River Keeper

>> Yes my name is Kate Murphy I'm a community organizer with Columbia River keeper. Recent weeks we have witnessed communities gathering together to show support and provide aid for those suffering unimaginable losses. Losses that are the result of unprecedented wildfires, field by ear responsible human activities and a lack of political will to value people over insatiable corporate profits. No one in our region look further than their own window to witness the effects of shortsighted decisions from those in positions of power. And now in the midst of this chaos we are here calling on you. The decision-makers at the Washington Department of ecology to fulfill your mission to protect our shared ecology so that may exist for future generations.

We are at a point in history where your decisions now truly shape the health and safety of the communities in this region and beyond for decades to come. The methanol refinery would worsen the crisis and cause comma just pollution. Urinalysis makes this clear. The project would generate 4.6 million tons of greenhouse gas pollution each year and up to 9.4 million tons of pollution if we assume a higher rate of pain releases during the fracking process. The number goes even higher if we assume all of it is burned as fuel which we know is the intention of request innovation works having advertised this liquid sunshine to investors while simultaneously misleading ecology and the public for years.

Let's see it for what it is.

A massive polluter.

You have been provided everything you need to deny this dangerous proposal.

There is no one who believes that believes will be the largest refinery will reduce greenhouse gas emissions. It's your duty to look at what we now.

This proposal will be a massive polluter and total opposition to Washington's climate goals and healthy future. We deserve better and calling on you to stand up for the people of this region for our environment, for the future. We are counting on you to do the right thing and deny this gas refinery. Take you.

Laurie Black

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Kurt Anagnostu

I was born here, went away to high school and college and law school in California but I have come back to practice law and raise my family. I have three sisters and a brother and families that continue to live in Calais County. I have a heartfelt commitment to this community.

And to make Calais County the best place it can be. Personally I have a theory that if I do all I can to improve my community and make it a better place to live and everyone did that same thing, together we could make the world a better place to live. That mindset in 2000 I ran and was elected to run on the city Council. I served on the Council and the last four of which I was Mayor of the city of Longview. Following that I ran for Cowlitz PD Commissioner. I can tell you being a lifelong Commissioner of Cowlitz County jobs are crucial. We have a higher unemployment rate generally. Historically it seems we have the first to lose jobs in the last to get them back. However weighing jobs against the environment is no question. I'm sitting here in my office looking out at the haze from the fires. There is no question that the environment takes precedent. The question for me becomes whether the plant will be built somewhere else. And has an insatiable appetite for plastic. Everything is made out of plastic. The computer case, the cell phone, what holds the windows in place is all plastic. And this will be built somewhere else and more polluting, the benefits to our county outweigh that. Thank you.

Allison Mettler

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Kathleen Patton

My name is Kathleen Patton and I am a 20-year resident of Cowlitz County and like many previous speakers I want to underline any imagine ecological unfit from this power plant is based on speculation and many, many assumptions while the facts are that it would become the largest producer of methanol in the world and we need right now the only way we know right now to curve the rage of climate change and the devastation that it brings with fire and flood. Is to keep these fuels in the ground. We do not need to be creating massive amounts of infrastructure for fossil fuel companies to continue to pour pollutants into our environment. We need to put a stop to all of it now. I hope you can hear me. Thank you.

Leonard Meyer

State Representative, 19th District

>> Hello I'm Jim Walsh, a steep representative in Olympia for the nineteenth district, including parts of Cowlitz county but not Kalama. Kalama is our neighbor. And I am encouraged by the department of ecology's draft second supplemental EIS. I encourage people who are speaking on this matter to look at the draft. We have to be consistent and rational. And how we evaluate environmental impacts of industrial projects or really any projects we consider state. In order to see that consistent perspective that we need to look appropriately at this project at the global carbon impacts. What this project will do is improve the global carbon footprint of the industries around the world. It is a net green projects. And that is a good thing not only for the economy of Cowlitz County a good thing for everyone on the globe. And I must say, I'm a little this appointed and some of the overall rhetoric and attacks and comments here. Please stay rational, stay based in science and facts. And read the second supplemental. This is a good project for Cowlitz County, for the globe and for Washington. Thank you.

Boilermakers Union Local 242

>> Thank you my name is Luke law fee, I made business manager Local 242, I support this on many fronts, jobs obviously 1,000 construction jobs over a three-year period. 200 permanent jobs in the community and another 500 indirect jobs. Not to mention 30 to \$40 million in the local tax base. Secondly technology produce methanol for natural gas is far better than for coal. Which is what the Chinese are doing without the regulations that we require. Methanol is not going way. I think it is hypocritical as we talk into plastic computers and phones and not to mention the plastic cars we drive down the road. We want these products but not in our backyard. It's always easier to say no rather than just work together to come to a common goal. All of my members are just as concerned about climate change as is everybody on the other side. So on a global level, this project is needed. That's all I have.

Thank you for your time.

Steve Berman

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Mark Keely

Good afternoon my name is Mark Keeley I've been a resident for four years. My wife and I move to Southwest Washington and fortunate to find a home that shares our core values. We found a quiet acre home on green mountain roads with woods and Riverview. And to develop it with rivers and walking trails was our plan. Including outdoor games, meals on our deck and River walks, and offers local recreation, antique stores and restaurants. This is a beautiful area and we were ready to work hard to make it a lifelong home. About 4.5 years ago we heard a foreign company wanted to build a chemical refinery here in Washington and here in Kalama-[cutting out] in we are not and in industrial area, what possibly could a refinery have in common with our small town? So far me and thousands of other people find it completely incompatible. With 4.6 million tons of carbon pollution spewed out every year. For 40 plus years, all I can see is the damage it will cause to the air, water, soil and everything hold dear about this area. Washington state sets a standard for clean sustainable living. That's why Gov. Insley could not find good clear conscience to support it. I urge you to reject Northwest innovation works fossil fuel refinery. Let the Evergreen State become the green wash state. Do not allow this permit. To the right thing for the people of Washington who you are charged with protecting. Thank you and next.

Cambria Keely

>> Hello my name is Andrea Healy, I'm in my fourth year av bachelors at Washington University and protesting the refinery for one quarter of my life. Thousands of precious hours day and night on holidays and birthdays to defeating this and telling you this to emphasize we are not here for fun, we are here because we need to ensure that Washington is headed for carbon negative future. And must be extensively considered and respected.

Every time I visit my 93-year-old father, he asked me when I plan to start a family and how many kids I want to raise. I tell him I would like to have 1 or 2 kids in my thirties. I don't tell him is that I'm terrified of what the world will look like in 20 to 30 years. Will my children have to wear a mask every where to decrease the pollutant inhalation and showing photos of a clean healthy Columbia River? Article 5 Section 1 of-- states everyone has the standard of living adequate [Indiscernible] I cannot in good function pass on to my children the burden of spending every day fighting for basic human rights.

We will not allow the consequences of the consumption of the world's largest methanol refinery here, the consequences are unavoidable and Columbia is the GESS River in our region, loosing toxins into the air that is usually clean and healthy. And the greenhouse gases. It is your mission to preserve, protect and enhance ecology and counting on you to quash this fossil fuel project.

We believe we can do other than to enforce a fossil gas dependent economy. I'm here to ask you with utmost earnestness to please deny the permits for the proposed methanol refinery.

Sally Keely

>> Hello, my name is Sally Keeley I'm an educator mother and longtime resident of Kalama, my husband and I own five acres home outside of the city. Have been working actively to stop the refinery for 4.5 years. As a mathematician I would normally provide you with a numerical analysis as I carefully read every page of the SEIS Bible reserve written comments yesterday want to speak for my heart. This is a climate disaster, we cannot afford the 4.6 million metric tons of carbon and report it will create every year for 40 years, we don't have time. We are in a climate emergency. That climate catastrophe is causing loss of life, land and livelihoods right now. You only need to look out the window to see in the global-- these are becoming more common and worsening each year our homes are on fire, the forest are on fire, the planet is on fire. My 18-year-old daughter has come of age during this crisis. If we don't reduce the emissions now she will have a future filled with extreme weather conditions, droughts, wildfires and other poor air all the. All parents want better life for their children. What happens when she wants to have a child? She would be a fantastic nurturing mother. Will she be forced into a vision of going childless not bring a child into a world overwhelmed by climate, pollution driven. How dare we put our children in that predicament. You have the ability to protect the people of Washington State young and old. That is your mission. You have the power to say no, I urge you to reject the shorelines permits for NWIW plant Thank you.

Emily Polanshek

My name is Emily Polanshek, resident of Portland, OR. I am a retired elementary school teacher, not a scientist, but I read science articles related to climate on a regular basis. I write out of deep concern for the livability of our NW region as well as our planet Earth.

From what I have read about selective data provided in the Second SEIS, I recommend that those who weigh our testimony take a step back to consider the big picture.

Although I am pleased to hear that some of those advocating in favor of the Kalama Methanol Project do care about the growing climate crisis, I strongly disagree with their reasoning. Recent science articles are sounding ever-louder alarms about the dangers of continued reliance on fossil fuels. We simply cannot afford to further extraction of fossil fuels if we want a livable planet for ourselves, our children, grandchildren and beyond.

We needed to leave most fossil fuels in the ground and start a national transition to non-carbon-emitting renewables years if not decades ago to avoid the severe storms, droughts, floods and wildfires that we're experiencing more and more frequently now.

Have any of you ever gone on a fad diet? While on the Grapefruit Diet in the ballet phase of my youth, I remember cheating by eating just one Oreo cookie. Then I slid down the slippery slope by erroneously thinking, "I already wrecked my diet so I might as well eat the whole package."

Similarly, just because we have not yet weaned ourselves from fossil fuels, we must NOT continue to invest in new facilities! We must close down existing projects as soon as possible and find alternatives to fossil fuel-based plastics or recycle the plastics already in our environment. We must invest in new energy sources for homes, businesses, transportation and agriculture.

Of course, the Pacific NW can't phase out climate pollution anywhere but in our small corner of North America. However, equally obviously, the more every region does to lower emissions – especially in countries with the highest energy production and consumption - the sooner we'll see a downward trend of the parts per million (ppm) of CO₂e in our atmosphere.

As you may know, in May 2020 our world hit a record high of 417 ppm of carbon dioxide as measured at the Mauna Loa Observatory, which has measured CO₂ in the atmosphere continually since 1958. Geologists have used ice cores to measure ppm of CO₂ at 280 ppm pre-industrial revolution, with only small fluctuations since humans evolved on the planet. Science is telling us to stop generating climate pollution!

Since the Kalama facility would generate around 4.6 million tons of carbon dioxide pollution each year and lock in 40 more years of consumer demand for gas rather than moving away from fossil fuels, I beg you to deny this project. You have all the data you need if you look beyond the distortions provided by the SSEIS.

Please consider the urgency of acting in order to slow the climate crisis and do the right thing. Deny the Kalama Methanol project.

Thank you, Emily Polanshek

Nicholas Heyer

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Washington State Building and Construction Trades Council

>> Thank you my name is Mark Raker the executive secretary of Washington State building and construction trades Council representing approximately 80,000 construction workers here in Washington state. We strongly support this project, permitting of this project. Archly due to the fact that the process which has been followed for approximately seven years now has been extremely thorough. Both sides, the proponents and the opponents of this project, have had many times to weigh in, many public comments and attended many hearings and provided all the data required for proper robust study. Department of ecology has studied and studied and studied it. The outcome is that it will be a net reduction of 6 million metric tons over what would happen if it were not in place. Those are positive changes. I think that the environmental advocacy amenity can take rate pride in making this proposal if it comes to pass, the cleanest methanol manufacturing plants on the planet. That is a net victory. And it has led to many frustrations. And we get that picked this is an emotional argument for all of us. The benefits from my perspective would be jobs. Need the jobs. But on a personal note I have property in Bridgeport. Just last Friday night I stood on the banks of the Columbia watching the wildfires -- and this is not something I see in a photograph, something I live I'm very well aware of it and because both sides have stakes of opposite positions we make progress. We have to make progress. This project makes progress and we need that to Luke forward. I'm about to be a grandfather at the end of October and my granddaughter, she deserves us to make progress and leave her a better plan as to all of our children Thank you.

Ann Dorsey

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Linda Leonard

>> Thank you very much Linda Leonard I'm a resident of Kalama, make no mistake about it the state of Washington and the world does not need the proposed methanol refinery to be built spirit Northwest innovation works has used the rationale, the facility will cause a net reduction in current greenhouse gas emission levels by forcing Chinese to call methanol facilities off-line. Ecologies analysis, the current global reet house gas emissions would increase substantially if this project were built spirit but perhaps not as substantially as if China's methanol demands were not met by other sources. The analysis of methanol markets for export facilities have impact analysis summary breeds, what would happen if the markets, the KMMEF were not to go into operation? The analysis of methanol supply in China shows there is existing capacity in China to increase methanol production and growing demands. This is expected to be supplied from coal-based methanol, lowest cost producer in China. Additional demand will be met with natural gas-based import which are also low. NWIW's facility is expected to be one of the lowest cost of these producers. But absent Kalama manufacturing and export facility other low-cost natural gas-based exporters would also supply the growing market in China. Thank you.

Mark Urhart

>> Thank you, my name is Mark, we live in the foothills overlooking the Columbia River. We are against this project. We purchased this property so we can enjoy the unobstructed view of the Columbia River and enjoy recreation and dining in the local area how we walk, hike and bicycle and kayak the Columbia River. Most importantly, I'm concerned about the future of my children and grandchildren. It's hard for me to count on my hand why anyone in this area would support a project that would adversely impact their health and overall quality of life. And offset of 40 years of dirty air and water cut noise and landscape pollution, and definite impact on climate change. I grew up in Southern California next to the oilfields and refineries. During my career I was stationed in Texas and observed the stinky and noisy refineries along the coastline. Trust me, we don't want to smell, we don't want the noise and the water and air pollution and the landscape pollution this facility will create. It will be in our backyard. I spent three days reading and dissecting the facts on the entire second supplemental EIS. The voluntary framework mitigation presented in appendix D is laughable.

By using the term in-state, Northwest innovation works is not willing to negate GHG's outside the state of Washington. This includes the fusion of methane and methanol burn and transport to China and as a fuel for the production. This is only one of the many glaring errors I saw and I will put the rest in writing. This project is a climate killer and the only responsible decision is for ecology to deny the shoreline permit. Thank you.

Mary Paterson

>> Yes we can hear you.

>> Great, good afternoon to the Washington Department of Ecology and everyone here from the communities. Someday I hope to be on the same side and we are working for green jobs. I am married Patterson, descendent of Scottish, Irish and-- immigrants. My grandfather grew up never knowing his own father who was killed in a coal mine accident in Scotland's. Fast-forward 2020, my own daughter is an environmental engineer in California state government. Trying to restrain the fossil fuel industry which continues to hold us in its tentacles. After more than five generations of fossil fuels, isn't finally time to say no and keep all fossil fuels in the ground where mother nature indeed put them? Two specific points, the first one the impacts of the fossil fuels in the U.S. or China for plastic or for fuel is immorally narrow comparison. In comparison with nobles is essential for any series evaluation. I believe it is missing from this. Second, on the question of leaks and fires during the entire lifecycle of methane, methanol, plastic and fuel, did the authors of the SEIS consult experts at Cornell University?

Did the authors or any of you here today view the video of chasing methane on YouTube, again chasing methane on YouTube or anyone interested. According to Noah, Lake are not 1 or 2 or 3% speculative report but some cases over 10%. Fails to use top-down leak measurements and thank you very much.

Matt Gamel

>> And Q I'm an environmental scientist and we recently moved out from the keys, because the hurricanes was becoming unbearable. As close as everyone knows the West Coast is now on fire. Great place to move. Laura Watson if you have any question about whether this is a change that is good, wake up and smell the shitty air, in a global scientist will tell you we are just starting to feel the effects of climate change. The methanol refinery would release smoke into the air and that doesn't care about boundaries, those would be just about your family and mine. If we don't burn the soil, the process these chemicals that someone else will cut does not make it true or right. If we as a society ever want to move away from fossil fuels, we need to stop subsidizing these and industries with taxpayer money. I understand there's a lot of washer and money behind this project. We all know it is wrong. Even the business behind it knows it's wrong. They just care more about the money in the short term. I beg you as a fellow lover of the state and someone just wanting to raise their family and a beautiful, or just place. Please take a stand and denied this project. Thank you.

Melanie Plaut

>> Hello this is Melanie cloud, today I'm testifying as salmon, I'm only sorry you can't see my lovely fins and tail. The trouble with using humans to tell a story is they freak on climate change.

Let me lay out the facts. Global warming threatens the survival of salmon, dunk salmon die on the water warms above a certain threshold and droughts can leave salmon stranded or exposed to predators and warmer temperatures increase fish diseases. Including toxic algae blooms. Northwest innovation works contents building the methanol plant will not increase global warming. But this flies in the face of fishy logic. They rely on the high speculative notion that coal will continue to be the substrate of choice for plastics production in China and that plastics production will continue to increase unabated for the next 40 years. It makes no sense to put a rosy shine on this by comparing it to the most worst imaginable scenario. Go back to the drawing board, don't be afraid to rely on science over politics and speculation. Wherever we are in this planet we face the climate effects of fossil fuels. We must be aware and share our stories. So pool up your friend, your community, state agencies and other allies in the rough waters. Make them copy and get them pointed into the current. Onward and upstream. Thank you Melanie.

IBEW Local 48, Columbia Pacific Building & Construction Trades Council

my name is Mike urges and I'm a father of two teenage children who spent most of our days at work or school and the call me River. I appreciate the opportunity to be able to give comment on behalf of myself and the thousands of building trades men and women I represent as resident along the construction trades Council. And is this rep for IDW Local 48. I would like to go on record and say that IDW and the rest of the building trades are eating the way into renewable energy and we work with our partners all over the nation and in Washington state on solar, wind and any other options that come up. We are not climate deniers. We are leading the way on this.

That's why we support this project. But going back to the local billing traits and affiliates partnered with Northwest innovations to maximize this investment in the region. Along with that, one of the goals was also to help protect the environment and the beautiful Columbia River we all love and rely on so much. Early on we found the innovation shared the same values and over the last six years have back that up with commitments to 0 liquid discharge and technologies and 100 percent mitigation plan for Washington state. We are very excited about the opportunity to move this project forward and I would say equally excited that we have a project that has helped a new higher standard for the environment and future development along the Columbia River in Washington and Oregon on. With that would urge the Department of ecology to expedite any process left so we can start building this facility and we can start reducing read house gases as soon as possible. Thank you.

Cyan Strategies

>> I run a sustainability consulting firm and Seattle cyan strategies in the former director of the office of sustainability environment. Three years ago many of the environmental unity question global greenhouse gas impacts of the project. And it found the additional analysis was necessary before permitting work that was completed last year and many environmentalists to have additional questions. And determining the comments on that draft warranted additional discussion, climate impacts and that led to the publication of the second supplemental gas. Environmentalists have asked good questions along the way. They asked ecology to analyze what would happen if methanol was used for fuel. The answer is that the project will reduce global department admissions by 6 million metric tons. They asked ecology to increase the upstream method rate, 3%, it will still produce global emissions by 5.5 million metric tons. A 20-year global warming potential, the answer is noble carbon emissions reduced by additional 1.5 million tons. And ask what would happen if the methanol did not displace hundred percent cold methanol. The answer is that the global apartment emissions would be reduced between 2.6 and 7.8 million metric tons. Environmental friends have asked good questions about the climate impacts of this plants. And the port studied the study and now ecology has studied the question and the answers have been the same. This plant will reduce double greenhouse gases by extraordinary amounts. And the latest analysis of the equivalent amount of carbon emissions from the cities of Seattle, Bellevue and Tacoma combine. Now they have been answered is time to take action to address climate change and build-- thank you.

Jennifer Valentine

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Randall Nerwick

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Mike Reuter

Hello my name is Mike Ruger and I'm speaking here as an individual and not as mayor of Kalama. I am opposed and some of the issues I will speak on now. The Northwest energy and for structure as a real thing, looming energy shortage caused by this resource monster will have the devastating effects on the local and state economy. Over two thirds of all average days demand that gas and Northwest pipeline and 100 μ W of clean hydropower combined with 4 million gallons of water all used by one customer. Is unacceptable. This perfectly design weapon to take out all the natural resources at one time. Way to shut down all the coal fire power plants supply firm renewable energy and meet the future needs in order to expand or start a new large energy manufacturing company. Without serious constraints. A 3 to 5-year past history of gas availability in order to study or to prove that there has been 320 million firms available, 247, rendered 65 days a year. And be not one winter day that would be even close to capacity. And also would like to see if the natural gas increase caused by the natural gas to world markets would cause paper mills and large industrial users to use higher carbon footprint opens like biomass oil or other fuel gas prices. It is up to China, not America to use the best way of making future refineries and be a partner for global reductions for future generations.

Thank you very much.

Rachael Hogan

>> Hello my name is Rachel Hogan and I am a resident of Seattle, the territory of the Duwamish people. I had to run for my life, from a place where the drinking water was poisoned, people and animals were being poisoned years after the industry left. I cannot even brush my teeth and take a shower.

I know firsthand the devastation of the Exxon Valdez oil spill.

I know what these things are like firsthand and that's why I am here. And now you don't need to use your imagination to understand the gravity of climate change. Because for most people things maybe just got real. This is exactly what economic totality looks like if Northwest innovation works guess to build. How many of us have lost our jobs? Not all prisoners inside of it are lucky. Our economy already in the toilet. About the draft analysis on the methanol refinery without touching on how damning it would be for water, upstream, on-site and downstream literally and not even adjusting for the low leakage figures by including top-down measurements on the estimates using U.S. locations. This massive refinery is expected to release at least 4.6 million tons of GHGs into the atmosphere each year. And it does not and will not meet the state's climate goals. Period. Meanwhile our kids are not having a childhood. They are suffering in every way, this is being framed as a lesser evil or, it is shameful and absolutely sickening. We are counting on you to say no. Reject the permit and allow for the creativity that comes out of necessity for better solutions. Thank you for your time.

Richard Marshall

>> Thank you for giving us the opportunity to speak. This methanol proposal is extraordinarily pessimistic, economic analysis behind the tired fossil fuel argument of better than the alternative as shoddy and speculative. No possible progress in this type of analysis. Ingenuity or creativity and no acknowledgment of technical policy innovations. From a policy standpoint, it is crazy to believe that societies across the globe will not demand cleaner economic processes and less pollution. Looking our own situation. Early this year we had a example of much cleaner air.

Number of people comment about how amazing it was in this past week we literally have a taste of the worst air pollution in the world. People everywhere want cleaner air and demand of the government for less pollution.

From a technology standpoint we can and will do better. Right now renewable energies with a form of new energy in most places in the world. What we have done with renewables is an amazing achievement of human engineered he and hard work applied to process improvement. This methanol postal on the other hand is a last gas effort-- the only thing green about this proposal would be the use of our federally subsidized clean renewable electricity to run the plant. That is our energy and better uses including heating and cooling our homes, hopefully reducing emissions from our cars so we can have inner air. Please analyze this proposal for what it is. An unmitigated fossil fuel export proposal with no hope of captured or sequestered emissions. Please don't rely on pessimistic speculation, relax analytic rigor that has technical advancements and renewable energies and discounts a livable planet and clean air. Thank you

John Svensson

I am opposed to the proposed Methanol Project on the Columbia River, I know it will produce terrific amounts of greenhouse gases. Since I have worked on the water most of my life I will comment on problems from that viewpoint.

I was a commercial fisherman in the Gulf of Alaska for some 20 years, dealing with oil ship navigation problems. I know they are hard to steer and require approximately 5 miles to stop. I am very familiar with how much power it takes to run a diesel powered vessel in different conditions.

Here are my comments:

1. The Panamax ships that will be used have very limited steerage and will require several tug boats to accompany them in the river. The tugs will be required to use close to full power to turn the vessel.. Example - The tugs burn 8 to 20 gallons an hour at idle and at cruising speed- however when they will be trying to position the large vessel it could go as high as 100+ gallons per hour . So in calculating the amount of pollution one needs to consider the amount of fuel burned when docking, positioning, and changing course; not just the 8 to 20 gallons per hour.
2. The possibility of a Panamax vessel running aground and the amount of fuel burned to get them back afloat also needs to be considered. Back in 2017 a 557-foot Panamanian-flagged tanker vessel ran aground on the Columbia River near Skamokawa. There are many other examples, but the point is, it happens. Tying up River traffic is an added problem.
3. I have worked on Fletcher's Ice Island 600 miles north of Point Barrow, Alaska and on the Columbia River, up to Rooster Rock. I was Senior Scientist aboard the USCG Staten Island in the Bering Straits, measuring water quality, temperatures, and current speeds. For some 15 years, I saw good science and some very bad science. The SSEIS has a lot of pertinent facts. The bad science comes in when someone tries to predict what people from a different cultural and political system are going to do half a world away from here, especially when they come to questionable conclusions that seem to meet their objectives.

I thank you for your time involved on this project. I think it's time to stop this massive greenhouse gas emitter.

Sincerely,

Captain John A. Svensson

Kalama resident

Rick Rappaport

Let me see if I have this right, the applicant says Washington state, that plastic demand is so strong, now and for the next 40 years, that if they don't build the 40-year project with Frak gas in China, China will build using coal by the same time the applicant sends out written information to potential investors telling them they will not produce last time and it is not profitable enough that they will produce fuel. Then the applicant says it's crystal ball shows a 40-year sustained demand for gas plastic at a time when there is as we speak a crushed world opinion and capital to remove plastic substitutes from sustainable resources and not fossil fuels. Then applicant says global emissions will be reduced if that permit is granted to them from the coal plant in China. The emissions or coal emissions, how about considering better options over the next order years. Isn't that your mission statement? To protect, preserve and enhance the environment? For current and future generations? I do not understand for the life of me you would put yourself into the box where the applicant-- you have the worst greenhouse gas emitter on the planet. That the government of Canada fully known as Northwest innovations-- the greenhouse gas emissions anytime and it can be deadly just to walk outside in Kalama and breathe the air. Because of climate impacts. This is a company that is already straightfaced lie to you about what they are going to do if they talk about on the other side of their mouth and say oh yeah will make plastic just give us the permit. Asked what that plastic market is much less profitable than expert reports circulating in China. Just incinerate any access. Not recycle it. Putting even more emissions into the air. They can't be trusted and downright dangerous.

Lorraine Martinez

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Terrel Aaenson

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Rob Harris

Manufacturing facilities that provides paper and cardboard for all the purchasing being made by Amazon, that is the preferred rate of shopping these days. Not to mention the bulk of the power coming from the coal-fired facility-- which I think everyone will like to see transition to a cleaner, burning fuel. I support of our mental action. I support advancement and transitional fuels and feedstocks and I support the Kalama process and innovation works. We need this in our community, it's a progressive step, we cannot cut off our nose despite our face angle from where we are today 20. And maintain any quality of life, people in Southwest Washington have enjoyed, hunting, fishing, boating, coexisting with industrial and a factoring for the last 90 years. So climate commissioners. The DOE, it's time to approve this project. Give all waited too long.

Rory Cowal

Hello my name is Rory and I live across the Columbia in Portland. I today I am urging you to reject the proposal that would present a great risk to our communities any huge setback in the efforts for greenhouse gas emissions. We need to transfer fossil fuels and not-- by any measure the quality of life in the Pacific West is determined by the health of the land, air and water. Oxygen that we breathe. The food we eat, natural places we go to boost the well-being and spent time with family and friends and none of these things are guaranteed to us or future generations unless we take care of our planet. The methanol guarantees for one thing for people in the U.S. Decades of pollution at extraordinary cost an enormous setback in the region's efforts to combat climate change, for the goals of the department of ecology to protect, preserve and enhance Washington's environment for current and future generations. The state of Washington must transition fossil fuels and begin fighting the climate crisis at the skill that scientists say is necessary. For my family, for your family, for the sake of our legacy to the next generation I am calling on you to reject the methanol refinery and to deny the shorelines permit for the projects. Thank you.

Troy Glennon

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Ruth Dallas

My name is Ruth Dallas, I'm not a scientist but I'm a nurse and mother and grandmother. I would like to speak from my heart. The dangers of fossil fuel are no longer in question. One does not need to visit the site of an environmental group rate of the imminent dangers of continuing use of fossil fuel. One can read this information on multiple government sites including NASA, the Defense Department as well. It is madness at this point to argue that building one type of fossil fuel Lance is okay because it is not as bad as some other type of fossil fuel. The Department of ecology have the responsibility to protect the environment and you have an awesome power. Give the power to protect your children and mine from the ravages of climate change. I ask you a simple question today. When will you decide that no number of jobs and no increase in your tax base is worth the well-being of our children and grandchildren? When you're grand children ask what you did to protect them and all the people in this client from climate change what will you tell them? Thank you.

Jason Thoennes

Dear Director Watson and Department of Ecology,

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Sept Gernez

Hello I'm an organizer your with the CR club. I represent 3.8 million supporters across the country counting on you to deny this project.

The club z mission is to explore, enjoy and protect the planet. This project would destroy the local environment, while massively intervening to global warming and working to stop it. I would like to remind you as others have, of your mission statements. The Department of ecology's mission is to protect, preserve and enhance Washington's land, air and water for current and future generations. Approval of this project would be counter to your mission. Especially frustrated with your displacement here he and the SSEIS, I have a Masters degree in economics and I can tell you any economic analysis is only as good as its assumptions. The scenarios don't assume any human agency to avoid our own demise back and therefore fails to assume self interested rational actors as we like to do an economic theory. Look outside. Our region is burning. There were boats, for love fossil fuels off the coast of California that have nowhere to go. Our world is on the brink of radical social change and you can't predict fossil fuels future without predicting human extinction. We don't need cleaner fossil fuels, we need to stop using fossil fuels period. I for one and working toward a future where my 4-year-old nephew will have an environment to enjoy. And where his kids can go out in the summer without a respirator. Please join me. Fight for a future where our children and their children can survive. It's simple please deny the project.

Sharon Bucher

Hello my name is Dr. Sharon Busher, I practice pediatrics in Vancouver for 35 years and lived in Battleground Washington. I first learned about greenhouse gases global warming, and premed classes in the seventies. It took 20 years to make it to the front page of time magazine. In the early nineties. It is now more than 30 years and we have yet to take adequate steps to address this crisis. It is or fined to me that this project is even being considered all we are in the midst of a climate emergency. In Los Angeles where I grew up, they recently recorded the highest number ever, 121 °, try living in that. I sympathize with you who need jobs who are in the building trades but guess what? The global South will need the buildings will make. To live and leave it, they are coming. We still have rain. We still have water. This project will emit tons of greenhouse gases and it will use up tons of water. It will pollute the water use to Frak the wells. The lateral pipeline will take animals used for domain. Not for the common good but for the profit of the Chinese company. The methanol is likely to be used for making plastic. And this is a world, that is drowning in plastic, which we were told to be recycled for those profiting from its manufacture. In the same way we are being told speculation about how this project will actually lower greenhouse gases which is truly laughable. We need a stable agriculture, livable climate, don't do it. Deny the comments.

Ruth Russell

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Sherry Hession

my name is Sherry Hirsch and I live in Spokane Washington. I am a concern citizen and grandkids that live near Longview, I'm against the project, against Canadian company shipping Frak gas to our state were a Chinese company to use our water to convert it to methanol. And then shipped back to China to make plastic or used for fuel. Or water and air are not for sale.

To make more plastic and bird methanol for Canadian and Chinese companies. Also the fires polluting the air now in Washington states are partly caused by drought in California, Washington and Oregon on. Millions of gallons of water are used for fracking oil. And there are millions of them. And this project would encourage more fracking and make our drought worse. Or fire equals more loss of life, property, unhealthy air and making everything unhealthy. My grandkids play in that water there. And now my granddaughter has trouble breathing. We need to invest in clean energy, I have been taking a poll on how many people are against this project.

I counted so far 51 to 11. 51 against, and please listen to the numbers and deny this project. Thank you.

Lorinda thomas

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Cowlitz Economic Development Council

My name is Ted, I'm the president of the nonprofit-- economic development Council, I have lived in Longview with my wife and children for 20 years. Academic develop my counsel is a membership raised operation since 1979.

Since COVID began we have helped administer over \$3.5 million to small business in Cowlitz County. The business open and people employed. Jobs and work our vital. In many ways, job defines who we are. And gives us pride and a sense of purpose in life. This project will provide vital jobs for our local families. Also it is a capital investment made by private sector companies that pay for the services that we all enjoy as part of a society government, infrastructure or sustainable without private sector investment. I can appreciate the intense scrutiny the Department of ecology has put this project through for the last six years. In my 25 years and economic development I have never seen a company be as innovative as this one from 0 liquid discharge, negating GHG's in Washington state, the innovation Works has met and exceeded all environment to hurdles put in front of them. Additionally the report of climate specifically prohibits the use of fuel so I don't even understand why that is part of the survey. Nevertheless I appreciate your time. Thank you very much and let's build this facility.

April Eversole

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Theodora Isongus

Good afternoon, I'm Dr. Theodora s address, environment, health scientist and epidemiologist with over 44 years experience evaluating effects of environmental pollutants. I fear the Washington Department of ecology is not taking science seriously. And a spokesperson for ecology concludes that read house gas emissions would reduce market this plant were operating then if it were not. This conclusion depends on other less efficient plants, seeking operations if this plant were operating. There is no way to know this and it would

Increase gas emissions in order to have a livable future. When there is overwhelming scientific evidence that we must make drastic reductions in greenhouse gas emissions now.

We can't afford to go down this suicidal path. We are assaulted by catastrophic climate disruption causing increased heat, droughts, wildfires, and breathable air, increased illness and death from heat, storms, diseases, no mac of lung disease, aggravated by air pollution, displacing thousands of people and what more of a wake-up call do you need? Please deny the shorelines permit and reject this proposal.

Therese Livella

Like many others I find myself wanting to curl up and cry. I cry for the insatiable inevitable consumption, and all the awful events that have culminated in 2020. I would have my sliding door open all the methanol comments to the sound of windchimes and Words. I would enjoy the trickle of water out on the yard custody there are no birds. There is no win. Toxic smoke-filled air subtle over the region for weeks now. The projected onshore wind and rain did not wash away our sins. The high range test kit I use to maintain the health of my face. Outdoor cat has happily become an indoor cat. I am one of the lucky ones. I still have a home to take refuge in. For now. Given the current limited understanding of mother nature and our fast-changing environment, it is clear that any scientific rejections made in the SEIS should be taken with a grain of salt. Please don't take offense, these are unpredictable times. Due to the current state of the environment, mitigation efforts must be carried out before any permits are issued. And those mitigation efforts must be based on the full lifecycle analysis. Because we all know right now that the Oregon smoke did not stay in Oregon on. And imagine under the current layer of smoke we now have a trapped layer of Northwest innovation Works fine particular matter insisting of heavy metals and percentages. The plan indicates neither party believes negation can be achieved. Because really how can you mitigate an earthquake. How can you mitigate fracking? You don't.

You just live with that.

You live with air you can't breathe, water you can't drink catfish you can't eat, let this be your legacy. Deny permits for innovation works.

Jennifer Brandon

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Tracy Ceravalo

A new fossil fuel facility will help the climates. Seeing this will help the claimant is like saying-- the grave is the one we are digging for ourselves. To put this in perspective the head of research, Exxon, that few people felt the world has entered into a transition away from dependence upon fossil fuels and towards a certain mix of renewable resources that will not pose greenhouse gas accumulation. The only question he said was how fast that would happen. Can you imagine them knowing that we are debating here per meeting in new fossil fuel facility 38 years later. And saying that we are hypocritical for wanting to deny the permit because we use plastic is ridiculous. If Northwest innovation Works was truly innovative, the focus on developing new ways to create plastics with suitable resources and without using a new fossil fuels. I ask that you deny permits for this project once and for all, thank you.

Tina Brakefield

My name is Tina Brakefield, I live in Vancouver and work as a stay-at-home mother to a 3-year-old daughter in run a sustainability law. I've come here today to talk about the refined ability project and how and why against it. Most of what I've written has been talked about and multiple other comments so I will go ahead and skip over those. One thing I will bring up and I always found this very interesting and no one has mentioned this yet. Is that while we are having the wildfires going on here there are at this moment five tropical cyclones that are simultaneously moving through the Atlantic right now. Now one of them, Sally finally hit yesterday the Florida Alabama border and unleashed the inches of rain in about four hours. That is about 30 months worth of rain and four hours. I'm from Austin Texas and I know someone recently came on and spoke about people from the South moving here.

It is happening because I am one of them. I was born in 1979 which was the first year that they did I think a climate change analysis. And for the entirety of my life, I have been watching things change. From when I was a young child until now. I have been dealing with, in Texas, 115 up to 120 ° summers nonstop for years now. People will be leaving that region. Because it will become inhabitable. And lastly I would like to say real quick, some numbers here. Someone mentioned we have a project giving 30 to \$40 million in revenue. You know how much damage the fires will do, 130 to 150 billion in losses. So from million 2 billion do the mass. And reject this project and the refinery in the shoreline project for this. Thank you.

Patricia Bryant

This is NO number 3!

Marylyn Cornwell

My name is Rev. Dr. Marilyn Carmel, I may retired Episcopal priest, scientist and member of ort of earth ministry. A person of faith I believe in a just and sustainable future. And clean air, clearing skies, clean water and abundant water are the birthright of all created beings. That sustainable future is at great risk.

I know a bit about the risk of fossil fuel plants for communities near them. I did my graduate work and self Texas where air and water pollution from oil and chemical plants has devastated human communities and the oceans living creatures. With long-term consequences for all the environmental of a station caused by the gas refined into methanol begins right where it is ran into the ground. I listened to the-- what the land and his family for over 150 years, because of Frank mining his family can no longer use it to drink. Leaks during fracking, transportation, refining it into methanol and then shipping the methanol overseas for youth are linked in a chain of illusion around the neck of the people and creatures of this plan. That was regularly contribute to greenhouse gas pollution. The cry that we cannot breathe becomes even greater if that chain tightens. Is the moral and spiritual obligation to confront the misinformation, speculation and omissions about the environmental effects of ethanol production by NWIW. The environmental cost to the many far outweigh any profit that would be made by the few. I urge you to deny the shoreline permit for the plant. The lives of the most vulnerable among us and those in future generations depend on it. Thank you.

Chris Chapin

I'm a resident of Washington, a concerned citizen. And I am here to oppose this project. I do want to thank you for your time. To take public comments. And that is really the issue we have here is an issue of time. We don't have time to be screwing around with fossil fuel projects anymore. Now is the time to invest in clean energy, now is the time to rebuild our environment, now is the time to get rid of artisan ship and come together and work towards a solution. Now I understand the communities where this project will be built, need jobs and need work. I'm very sympathetic to that. I believe every person has a right to a dignified life. And what I think we can do instead is we can look towards other projects. We can look towards renewable energy projects. You know the obvious ones. Solar, wind. There is no stuff being developed, waves offshore. Capturing energy from the water and there is other types of energy are not electricity. We have destroyed 30% of arable soil on this planet. We need to start rebuilding ecosystems. We need to restart holding the bio diversity. These are projects that Northwest innovation would be more than capable of doing an awesome job. They have the manpower, they have the machines. And they have the knowledge. So I urge them to look towards other solutions. Thank you.

Bryant Mullin

Thank you name is Ryan Mullen, I may Local 26 member, 27-year member. I work in the building trades as construction electrician, wireman, I've worked on many of these industrial projects. Nuclear power houses, dams, all of these kind of things. Mills, these are good jobs. This job is environmental friendly, I've heard a lot of talk on here about how it is not. The science shows that it is. I was to talk about some green jobs. There is a windfarm being built right now in Lewis County. And there was opposition to that. That is a green job. Deposition was for whatever reason. But that is a green job. And we need to move this project forward and I'm in support of this project. We need to get this, that economy going. That community going. And I want to thank you for your time. And thank everyone for their comments.

JH Kelly

Hello my name is Mason Evans, I'm the president of JH Kelly, road union construction firm headquartered in Longview Washington. I value environment and support actions that reduce double greenhouse gases particularly use of transitional feedstocks and new manufacturing technologies. I support the methanol project because it brings much-needed jobs to Cowlitz County, the features that benefit the local environment such as ultralow emissions technology and equipment to mitigate for Washington air emissions. Must import lien the project reduces global greenhouse gases. After reviewing the supplemental EIS feel it a methodology to review the project.

For these reasons I ask the department of ecology to accept the conclusions and issues the shoreline and other necessary permits for the ethanol facility. Thank you.

Gail Dominick

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Sierra Club

Hello there my name is Tori and I'm an organizer with Sierra Club. This past week I've actually been replaying in my mind the first moments I learned about how dire the crisis became back when I was in college. And then-- pandemic them back to my dorm room where my roommate was here. I told her it this will be wild, you are going to be wearing gas mask for the time we are 50. That was nine years ago. I'm now 28 in my career is this. Trying to convince decision-makers to stop digging a hole for us when the facts are in our face. Now I am wearing a gas mask to the grocery store and to be honest it feels increasingly more like a dark comedy skit. Were people will spend the science so they can keep the business as usual. And we are putting the personal incidents of sight. This SEIS continues to use low estimates. And proportion of gas emitted-- only 4.6%, for underreported leaks in Canada. SEIS to be revised to the scenario in the high scenario would be 3% to capture the range of attentional upstream proportion of the projects emissions. Because the truth is that gas leaks all over the place. Significantly. Methane in this game is estimated at every stage of extraction, transport and aggression including Canadian progression. And describing the extensive field research in the investigation yields multiple issues including chronic under counting emissions gas wells. Little to no government oversight. Direct venting of. Methane an ongoing leakage from defect wells and reported in the watershed--

Mary Lou Dickerson

Hello this is retired state representative Mary Lou Dickerson, I lived in Seattle in the past two weeks my fellow residents have been choking on smoke caused by the fires pick these are directly related to climate change as has been noted by the governors of Washington and Oregon on. I care about the siding of this plant because I love the Northwest. I don't want it to be unnecessarily harmed by the huge influx of greenhouse gases that will result from the refinery. The analysis demonstrates refinery will cause 4.6 million tons of carbon pollution each year for 40 years. This all feeds into climate change. And in the face of Washington's displayed of mandated climate goals and I should know I helped write them. And the displacement argument in over a 40-year period in history tells us how markets fluctuate from that. And especially over a period of 40 years. There is no good way to accurately predict what they will be. Climate change and most likely-- instead of this plant we must more vigorously focus on green energy. Wind, solar, etc. Right now. We can do this if we use the same level of the energy and focus on creating green energy. That we are currently using and finding a vaccine for COVID-19. It is every bit as important. I urge you to deny the refinery and shoreline permit. It's the right thing to do. Thank you very much.

Richard Miescher

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Vic Leatzow

Good afternoon-- community since Kalama was founded. [[Background interference [fire radio]] this project would increase the budget and reduce the fire rate and increase the ability to upgrade on staffing. Which we have not done since 2002. We have greatly been involved with-- and looking at the plans for the facility. And as we are industrial based community with-- chemical facilities it uses pressure in the process but not pressure in the stories.

And safety precautions and safety systems in place with all the codes. And different than what the other industrial partners have. With that being said, we ask that this has been looked at three different times now and to move forward with this project and we hope that ecology takes out the emotion and looks at the facts. And moves forward with allowing the permits to be issued. Thank you.

Susan Schwartz

Okay this project a violation of the greenhouse gas reduction that we in the legislature and state of Washington has been working on. I look outside and what is going on with the weather and all the people out there that live in the homes, they are homeless and in the southeast they are losing their homes and what is going on down there. And it is all based on this. And this would increase the state greenhouse gas emissions to almost 1 million GHG's a year and making it one of the states largest emitters of greenhouse gases. I think that is wrong. Work okay I am done now.

Tom Luce

Hello this is Tom, I'm a resident of Cowlitz County, this will displace globally tons of gas of greenhouse emissions. On top of it it will mitigate for everything that happens in this state. I think it is important when we listen to the arguments in favor and against this project. That we come not from a place of not in my backyard but we are one part of a global community. What we are experiencing this week is a direct and even if you get all the greenhouse gas emissions in the state down to 0 we would be impacted by the global markets. That is not to say we should not do our part in Washington state. Northwest innovation is doing its part. But I think we need to realize we are all consumers of materials. Far beyond just plastic and I think that Northwest innovation works should be commended. For the efforts they made around mitigation in the state. And I think the department and the support is thorough, rigorous and comprehensive. In it comes to its analysis of the global markets and the displacement theories underlying report. Thank you so much.

John Thompson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Sandra Herald

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Felicity Hohenshelt

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Mary Ellen Smith

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a future for our sacred earth that will sustain all life. To do that we must stop the use of fossil fuels and invest in renewable energy. We should not and must not contribute to the pollution of our waters and air by the use of fracked gas to make methanol which will be shipped overseas for the production of more plastics. This makes no sense and quite frankly is morally wrong.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms Mary Ellen Smith

However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

John Dunn

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. Linda Leonard

The proverb "Charity begins at home" expresses the overriding demand to take care of one's family, before caring for others.

This beloved state of Washington is home, the clean water and air we breathe, the Columbia River, the surrounding mountains and streams are for all to enjoy.

Northwest Innovation Works' proposed fracked gas to methanol refinery would cause millions of tons of greenhouse gas pollution each year for 40 years. This project would cause a massive amount of climate pollution, a staggering 4.6 million tons of CO₂e every year for forty years making it one of Washington State's most significant sources of climate changing pollution and use more fracked gas than all of this state's gas-fired power plants combined.

This level of pollution is inconsistent with achieving our climate goals, protecting Washington's Shorelines and charting a path to keep global temperature rise below 2 degrees Celsius.

The SSEIS analysis has significant issues.

1. It relies on hypothetical future displacement of coal. The unrealistic assumption that Northwest Innovation Works' methanol refinery would prevent coal based competitors from producing more methanol in the future is a farce.
2. Feeding more low-cost methanol into global markets would increase demand and consumption of methanol. Basic economics is supply and demand. The SSEIS assumes that changes in supply will have no effect on price and therefore, methanol consumption is fixed.
3. The only way to accurately capture methane leakage is to use satellite based top down methodology, why is this scientifically accounting for methane leakage dismissed?

The evident in this SSEIS demonstrates that Department of Ecology should deny NWIW's proposal to build and operate this dangerous fracked gas to methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

I urge DOE to honor its mission to "Protect, preserve and enhance the environment for current and future generations. Please deny the permit.

Kathleen Martin

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

John Keefe

Dear Sirs:

As a Washington state tax payer I wish to oppose the development of the Kalama Methanol plant proposal. My reading recently on the project informs me that much of its output is to create products for export to China. I do not feel the risk to our environment is worth benefiting a country we are presently in a low key trade war with.

I am further offended by the knowledge that significant property will need to be appropriated by the extension of pipelines to this facility that will negatively affect my fellow taxpayers' rights. If it was to create end products that this country genuinely needs, (besides jobs), it might be a risk worth considering but not otherwise.

We are able to produce this product domestically in sufficient quantities, indeed excess quantity and do not need to help the Chinese produce more of it. Let them open their markets more to our products, before selling them materials to produce and sell into our end markets.

In closing I would state that this project seems to be at odds with our Pacific NW identity and will have negative consequences to Washington state that will more than offset those benefits the project theorizes it might provide. I feel you are burdening the taxpayer with a project that could become obsolete or problematic in a few years and we should not be required to support, either on a state or federal level, this project in any way.

Respectfully submitted:

John Keefe

Barclay Hauber

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Betsey Thoennes

Dear Director Watson and Department of Ecology,

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Hoa P

Dear Director Watson and Department of Ecology,

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Natalie LaBerge

Dear Director Watson and Department of Ecology,

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Sincerely,

Natalie LaBerge

Martha Taylor

Dear Director Watson and Department of Ecology,

I am very concerned about the environmental and climate change implications of the proposed Methano Refinery in Kalama. I believe our society needs to move away from huge fossil fuel projects that perpetuate the use of single-use plastics that degrade our environment when they end up in the oceans. Promoting this refinery is not in the best interests of the citizens of Washington.

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

William Johnson

Dear Director Watson and Department of Ecology,

I am very concerned about the environmental and climate change implications of the proposed Methano Refinery in Kalama. I believe our society needs to move away from huge fossil fuel projects that perpetuate the use of single-use plastics that degrade our environment when they end up in the oceans. Promoting this refinery is not in the best interests of the citizens of Washington.

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Kaitlyn Welzen

Dear Director Watson and Department of Ecology,
Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Yours sincerely,
Kaitlyn Welzen

Marilyn Miller

Dear Director Watson and Department of Ecology,
Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Yours sincerely,
Marilyn Miller

Carolyn Eden

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jackie Jeffers

Dear Director Watson and Department of Ecology,

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Sue Thompson

Dear Director Watson and Department of Ecology,

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Shelly Ackerman

Dear Director Watson and Department of Ecology,

The citizens of WA, the US and the world are standing up to plastics that are finding their way into our water ways and leaching into our drinking water. Plastics take forever to breakdown. In fact, they really don't break down fully. I write to plead to your heart and longterm thinking brain, to reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about the future for my children and future grandchildren, about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Shirlee Tan

Dear Director Watson and Department of Ecology,

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit. I am concerned about climate change and the massive implications of this facility. I also am opposed to the continued proliferation of facilities that create chemicals to make more plastic.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is a mistake for Washington. Northwest Innovation Works cannot be trusted to mitigate the impacts of this fracked gas refinery.

Please deny this project.

Judy Romano

Kalama's Fracked Gas Methanol Refinery would be a terrible mistake on a worldwide level

What caused the recent odd weather in the Pacific Northwest? NOAA, meteorologists and the governors of Washington, Oregon, and California agree that it is global warming that is causing temperatures to soar around the world and sparking these fires.

Global warming is primarily fueled by atmospheric carbon from fossil fuels. The Kalama Methanol Refinery will be the largest GHG emitter in Washington, it is dependent on fracked gas, one of the worst fossil fuels, particularly because it leaks methane. Methane is 80 times stronger in GHG's than Carbon Dioxide (Co2). Listen to the scientists and our governors who are calling for a halt to new carbon emitting fossil fuel projects and move to renewable energy - for a livable world for our children. Stop the Methanol Refinery project and help us have a greener future.

Kalama Methanol Refinery is a mistake, and our fires are not the trees fault.

Please do not let this refinery go forward.

Our children and grandchildren thank you

Judy VanderMaten

And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Russell La Claire

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. Linda Zaugg

With Washington state working hard to reduce greenhouse gas emissions and to become carbon neutral, this project works in exactly the wrong direction. The danger to the Columbia River from leaks and the increase in demand for natural gas, which we need to stop using altogether, combine to make this project unconscionable. No to permitting this project!

Kimberly Wiley

ROBERT CORPUS

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jelica Roland

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

Re: Northwest Innovation Works, LLC. proposal to develop and operate a natural gas-to-methanol production plant and storage facilities on approximately 90 acres at the Port of Kalama.

I recently visited Kalama and the Port public park, which was alongside the Columbia River. It was filled with families enjoying the river and access to a playground for their children.

The community of Kalama and the State of Washington are at undue risk of secondary health risks caused by the emissions from this gas to methane facility -- that includes diesel particulate air pollution that are reported to exceed WA state's acceptable levels by five times. We must identify the levels of ammonia, carbon monoxide, and nitrogen dioxide and their risks to the Kalama community and the communities upwind and downwind of this plant.

The WA legislature has adopted limits to reduce the state's greenhouse gas emissions in the years' ahead, with the first goal to reduce GHG emissions to 1990 levels by 2020, AND by 2030 to reduce our GHG emissions to 45% below 1990 levels. The WA DOE ABSOLUTELY SHOULD NOT ALLOW THIS PLANT TO BE BUILD IN THE STATE or REGION, AS IT WILL ONLY CREATE GREATER RISK FOR WARMING TEMPERATURES LOCALLY AND UNACCEPTABLE INCREASES IN THE STATES GHG EMISSIONS! WE MUST REMAIN COMMITTED TO THESE OBJECTIVES SET BY OUR LEGISLATURE!!

We must tell these polluters they are wasting their time on such proposals. These companies must be held responsible and MUST show decisively that their activities do not cause harm to the state of Washington's goal to reach their 2030 GHG targets.

Excessive GHG cause warming air temperatures which then increase the temperatures of local bodies of water, like the Columbia River, which is the home to extensive salmon runs. How are NW Innovation Works PROTECTING SALMON RUNS?

Northwest Innovation Works must be held accountable for documenting there is no risk for WA and NW salmon runs as a result of this methanol plant. The state has spent nearly a billion dollars to protect these runs for our native peoples and the local citizens over the past 30 years, and one company does not have the right to destroy the native salmon fisheries industry.

It is A STATEMENT OF NEGLIGENCE AND DISREGARD FOR HUMAN LIFE AND THE LIFE OF LOCAL SPECIES IN OUR STATE to be adding MORE GHG at this time.

Rejecting this proposal is SMART and will save Washingtonians millions of dollars; we do not have funds to fight more forest fires as the result of rising GHG , causing more local droughts and water shortages for the forestry and agriculture community.

The seismic risk our state expects in the next 50 years cannot be ignored by this applicant. We must demand a REAL plan guaranteeing the 72,000,000 gallons of flammable methanol stored on soil will not liquefy in the 6-7.5 earthquake predicted for our region. THIS IS TOO RISKY TO APPROVE!

It is essential DOE addresses these concerns and tells this company the risks do not balance the needs of our state and community for a healthy lives and jobs.

Don't be fooled by their attempts to sell us on all the jobs this plant will create. It is time we demand truly innovative planning for our FOSSIL FUEL FREE FUTURE using sustainable, energy sources like wind and solar, which are already much cheaper and safer and will offer safe and better wage jobs than a Polluting MONSTER like this plant.

Politely tell NW Innovation Works... NO this plant will not be built in Kalama and should not be built anywhere. Advise them to put their investment into R& D for innovation that really changes the way we live and work in our state. We don't want more forest fires, their pollution, and jobs that make people sick. Cold water is essential for salmon to survive and this proposal puts salmon and all the species that depend on Salmon at risk.

NASA has published data showing our GHG levels are the highest they have ever been during human life on this planet . If we ignore their warning, in favor of short-term monetary gains... a livable planet is looking more uncertain every year. In 2019, 11,000 climate scientists, with the lead researcher from Oregon State University, have signed a document demanding we the citizens and governments of the U.S. take the climate disaster and high level of GHG seriously otherwise life on this planet will be seriously in question.

STOP this unnecessary methanol production IMMEDIATELY.

Submitted with deep concern for life on this planet,
Cyndi Strid , White Salmon Washington resident

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Kevin Melfi

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Tania Malven

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Cynthia Volk

We have lived in Kalama for 40 years and own a home and acreage on Cloverdale Road. I feel that building this plant in Kalama will be a huge negative impact on the sale price of our home that we have worked our entire lives for and will need in retirement. We do not need to sell and/or subsidize any plant in the United States not owned by our country. I do not believe that the Chinese are being truthful as to their intentions and statements made to their investors are proof of this. Our port has done a wonderful job in Kalama and we can be very proud of the efforts that they have made, but this is not their finest hour. I hope that these last few minutes have not been a waste of time and that you are seriously taking what I say into consideration.

Cynthia Volk

William Golding

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jeanne Longley

I am submitting my daughter Laurie Solomon's comments as I could not say it better. Please do not ruin our environment for financial gain! Jeanne Longley, PhD, Portland Oregon

Hello,

Here is a copy of my statement to the Department of Ecology, just in case you're interested. The link to submit your comment is at the end, should you decide to do so.

My name is Laurie Solomon. I have been going camping and fishing since I was old enough to walk and talk. I have been an acupuncturist in Clark County since 2001. I have never gone to China; I realized in the 90's that colleagues who go there for Chinese herbs, or to study with acupuncturists there, usually have upper respiratory tract problems for at least a month after they return. As a former cigarette smoker, I have never considered visiting the country where my career ostensibly originated; Throughout China, the skies are gray with Industrial Air Pollution, with Beijing reportedly filled with pay-phone like stations for people to get a few minutes of Oxygen in these booths, after depositing a few coins.

It is not a surprise that companies supported by the Chinese companies, are spending so much to convince citizens and regulators in this country to continue to supply their country with Fracked Gas. Fracked Gas is extremely harmful to the environment, along with pipelines, releasing greenhouse gases, fossil fuel spills and leaks, burning methanol as fuel in China, and the endless stream of single-use plastics.

Another consideration for me is the extreme amount of both Fracked Gas and Electricity predicted to be used by this Methanol Refinery! It seems obvious that the cost of these two commodities would go sky-high for Washington residents because we'd be competing with the Refinery for them! But many seem willing to destroy our peaceful, healthy environment, where fishing has already become less productive due to climate change, to allow transport of extracted gas through certain-to-leak pipelines passing through our state; to allow enormous amounts of Greenhouse Gas Emissions to pollute our state's air; and then to voluntarily pay more (due to high demand) for the Natural Gas, Water, and Electricity that we currently pay relatively little to use. It doesn't make any sense. And it seems very unlikely that China would give up some of its coal-powered refineries just because we in Washington decide to allow the construction of the biggest fracked-gas-to-methanol refinery in the world. There are currently wind-generating machines sitting unused in China because the conversion from coal to wind-power is too difficult for each municipality to justify building.

It is heart-breaking to realize that this proposed atrocity on the Mighty Columbia River is all about jobs, port rent receipts, tax revenue, high profits for a foreign developer, and, if truth-be-told, bribes behind-the-scenes. This is not the long-term vision needed for future generations. We, as a human species need to act now to save our planet. Subsidized fossil fuel extraction and usage is devastating this world. Now's the time to make the switch to green, renewable energy. Our state is supposed to be all about that! Cowlitz County's citizens could be put to work building light-rail or a high-speed magnetic-levitation train along the I-5 corridor from Portland to Seattle, for instance! Retraining to build solar power and use the existing pipelines to transport water are other examples of good jobs!

I hope that we can continue to count on Governor Inslee, who claims concern for the Climate Crisis, along with Laura Watson and her Department of Ecology Team, to lead the way by rejecting another Fossil Fuel Disaster. Neither Indigenous Peoples of Canada nor citizens of Kalama should be expected reside in "sacrifice zones."

Thank you for your consideration of my comment.

Jo Hebbeger

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Dustin Sevilla

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Martin Fisher

I am writing to urge you to stop the proposed methanol refinery at Kalama from moving forward.

The State of Washington and Governor Inslee have pledged to move away from reliance on fossil fuels, and toward clean sources of energy, in order to combat climate change. Fighting climate change is a serious policy priority of the state government, and this methanol refinery would be a move in opposition to that worthy commitment, as the refinery would cause millions of tons of greenhouse gas pollution every year.

Further, the EIS is flawed and cannot be relied upon as a sound analysis of the environmental impact of this project. It speculates on how methanol may compare with future, unsure, alternate sources of pollution in overseas markets. The SEIS makes a false and erroneous comparison with potential future other sources of methanol or olefin production. Rather than engaging in this speculation, Ecology should focus on the real-world, known pollution that will come from the facility rather than NWIW's dubious "displacement" argument.

The pipeline that would be required for this project is also likely to be a further source of pollution, potential leaks, environmental damage, and damage to the communities in which it runs.

Finally, I am extremely concerned about pollution to the Columbia River if this project moves forward. Not only does this cause long-term damage to the ecology of the region as a whole, and threaten the habitats of important species, but it also is a threat to the Native American communities who especially are reliant upon the river for salmon fishing.

Please deny the permit for this project.

Deborah Lipman

Chris Roberts

As a Kalama, Washington, American, and world citizen, I am vehemently against the proposed methanol plant. Despite what what written in the thoroughly debunked "independent" study funded by Northwest Innovation Works, it is plainly obvious that there are only economic benefits to a methanol plant and not a single ecological or environmental one. From the destruction of riparian areas, to the use of precious water and electricity, to the use of chemical derived from fracking, to greenhouse emissions, to the planet's need to reduce its plastic consumption, to Northwest Innovation Works' intent to also sell the methanol as a greenhouse gas-emitting fuel, there is absolutely no reason to approve this project. It is a money grab, and nothing else.

Environmental impacts occur at both fine and coarse scales, and both need addressed in any EIS. This methanol plant is a bad idea.

Sam Rich

Not interested in having another dying industry's products potentially contaminate our land. Please refuse it as 1) It's not a necessity, and 2) it's potential longterm downside for the environment outweighs any potential short-term benefits to people.

K K

Department of Ecology,

I am urging you to DENY THE PERMIT needed for Chinese government-owned methanol producer, Northwest Innovation Works to proceed with building the methanol plant in Kalama. Earlier this year, Sec. of State Mike Pompeo warned state governors to be wary of China's strategic intention to influence U.S. lawmakers and citizens and that China's Communist Party has infiltrated various levels of America's infrastructure and is working to destroy the values of the United States. Pompeo warned that Chinese Communist party officials are cultivating relationships with local politicians.

Washington State Rep. Richard DeBolt is the Director of External Relations with NWIW. He earns at least \$120,000 annually according to state records. It is completely inappropriate and UNETHICAL for him to be promoting the methanol plant when he votes and works on the state budgets that also fund the Department of Ecology.

"We can't ignore China's actions and strategic intentions," Pompeo said while addressing the National Governors Association ♦ winter meeting. ♦ "The Chinese government ♦ has been methodical in the way it's analyzed our system...it's assessed our vulnerabilities and it's decided to exploit our freedoms, to gain an advantage over us at the federal level, the state level ♦ and the local level."

Please align your permit decision making with Governor Inslee who reversed his stance in May of 2019 after initially saying the plant would reduce greenhouse gasses and produce cleaner energy. "We want to be consistent to that spirit of progress. Therefore, I cannot in good conscience support continued construction of a liquefied natural gas plant in Tacoma or a methanol production facility in Kalama," Inslee ♦ said after signing a bill banning fracking for oil and natural gas in Washington State.

Approval of the Kalama methanol plant permit does NOT SUPPORT Governor Inslee's 10 year 100% Clean Energy for America Plan. Please shut this down.

P Beck

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. I strongly urge you to keep communities safe and keep Washington on track to meet the goals for reducing climate pollution.

However, you **MUST** do **MUCH** more. We **MUST** keep **ALL** climate-changing fossil fuels **IN THE**

GROUND! We MUST achieve 100% clean, renewable energy by 2030.

Tom Samuels

NWIW initially claimed the methanol would only be used for plastic production and vehemently denied the methanol would be used as fuel. But then their investor marketing materials leaked showing the methanol would be used for fuel, yet they still pinky-swore to the public it wouldn't be. Now they have secured transportation for the methanol using ships that, wait for it, burn methanol as fuel. But it won't be this methanol fueling the ship, it will be some other methanol! Trust us!

Who are you going to believe, NWIW or your lying eyes? /s

Folks, if despite all of NWIW's naked deceit you still support polluting our region and wasting our resources to ultimately FUEL CHINA'S NAVY, at best you're as short-sighted as the day is long, at worst, you're an un-American traitor who values currency over country. The NWIW proposal must be rejected, and no shoreline permit should be granted.

Lori McKole

However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Judy LeBlanc

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

I am a parent and grandparent and have grave concern about what kind of world I will be leaving for them as well as all other people.

In order to slow the chances of cataclysmic results of climate change all new infrastructure supporting the production and refining of fossil fuels needs to end and our efforts need to focus on the production and use of renewal energy. Anything short of this is irresponsible and short sighted. Please recognize the negative impact this plant will have on people and our planet and deny permits for it to move forward.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Judy LeBlanc

Jan Ruud

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

During my twenty years as pastor of a lutheran congregation in Tacoma, I have sought opportunities to stand with those who are the most vulnerable in our community, including human beings, fish and wildlife, and the fragile creation around us. I am especially mindful of the great harm and offense this proposed project represents to our sisters and brothers of the Puyallup Tribe of Indians. In my advocacy with them, I have also listened to scientists in my congregation who have helped me understand the devastating effects of fracked gas overall and reject the false claims that it represents our best option.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Our coast is on fire. No. Just, no. Stop. Short term profits can no longer be prioritized over long term environmental impact - that thing that is gonna harm profits later, and lives now. Short term gains should never have been the priority. Enough is enough, no means no.

Marianne Petersen-Ries

Hopefully this extension of licensure of the methanol plant will NOT be approved. With all the global warming and our forests going up in flames, this does not seem appropriate. NPR reported this facility of having a fire. They put it out with sand, but, when the Fire Department came, they locked the gates and would not allow them on the property...this facility seems to be corrupt to me. We need more overwatch for facilities like these. Lives depend on it, children, parents, everyone deserves clean air and a good life. Thank you for listening.

Wendy Zieve

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Our children deserve a future in a clean environment and a safe planet.

Helen Pacheco

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

As a state, Washington has made a great commitment to green renewable energy as a way to fight the climate change emergency currently threatening the lives and livelihoods of all Earth citizens. As WA state citizens, my family has personally committed to the role of green renewable energy by participating in the energy buy back program with our solar panels on the house and owning two electric vehicles. This project completely negates the progress and commitment of thousands of fellow citizens who are making their voices heard with this type of choice. We need more renewable green energy projects that will fuel economic and ecological success in this state instead of huge polluters constructed for the benefit of a few profiteers making big money from the sale of toxic energy overseas.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. E Geballe

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jean Perklins

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Kelsey King

I am submitting a comment on the Kalama methanol plant Supplemental EIS.

We cannot fight climate change by creating new investments in fossil fuels. Natural gas is as natural as oil, but in not a sustainable fuel. Here are reasons that make us think the supplemental EIS is faulty.

Deception, Deflection, and Lies from the Gas Industry

1. They call it "Natural" Gas. That is salesmanship, like inferring that Greenland is Green.
2. Twenty cities in California, and ten cities on the east coast are developing policies to require new construction to be all electric. The fossil gas industry is fighting back with a massive campaign on TV and FB promoting gas cookstoves, ignoring the fact that gas cookstoves can make the air inside a home more polluted than the law would allow the outside air next to a powerplant.
3. They say gas burns cleaner, but they ignore the fact that a neighborhood with all electric heat is even cleaner.
4. They promote gas heat but none of the vented fumes from water heaters and furnaces are treated for NOx before discharge. Meanwhile, we have spent billions to remove NOx from gas power plants and auto exhaust.
5. They promote renewable or biogas, as though we had the ability to provide more than just the 5% of what they would actually need.
6. They say that gas power plants produce only 50% of the CO2 emissions as coal power plants, but ignore the methane that leaks before the gas reaches the burner tip.
7. They treat LNG with the same green-brush, but liquefied natural gas is worse because of all the energy needed for the liquefaction process.
8. They've deflected by having us speculate that if the Kalama Methanol Plant is built, that the global emissions would be less, but people are waking up everywhere, even in China and we must not make it harder for them by approving this project.
9. The plastics industry is part of the oil and gas industry and they sponsor recycling campaigns to make us think that most plastic would be recycled, but the majority is buried or burned as trash.
10. The fertilizer industry is part of the gas industry and they point their fingers at dairy gas, to deflect attention from the greater emissions from the fertilizer plants.

Market Forecasts

The EIS speculates on the global markets for methanol. We believe that the proponent advocated heavily for that speculation to be included.

Back in the '70s, all the electric utilities forecast that there would be a 300% growth in demand by this time. They were starting nuclear plants like crazy around here. Their forecasts were far overblown.

Thanks to our friend Lloyd Marbet, only one of the 21 proposed nuclear power plants is operating now, and renewables plus batteries could close it, for less cost than keeping it running.

It is not possible to predict market conditions for methanol or plastic. The resistance movement is everywhere, even in China. Many places (including Washington, by 2022) have banned various forms of plastic and after China cooked up this proposal in 2008, China became the world's leader in wind, solar, electric buses and cars. The Chinese have the strictest emissions standards for automobiles in the world. They could not forecast that in 2008.

Displacement Speculation

The basic argument of the proponents, is that, if we don't build this methanol plant, then China will build something that produces more CO2, for the same product.

That's like saying, "If we don't sell nuclear weapons to North Korea, then someone else with less oversight, will.

The Unions representing the Building Trades

We believe in unions; Don was a member of one for his entire teaching career.

When speakers who represent the building trades talk, it is important to realize that they represent the unions, but not most of the workers in the building trades.

In general, the developer of a large energy project will sign a contract with the construction unions, promising union jobs in exchange for turning out members to speak in support of a project.

The policy of the National Building Trade Unions is to support all large energy projects, Period.

Why is that? Generally, the companies that install rooftop solar are not union, and those projects are small in comparison to a major energy project.

All those speaking in favor of the project, are assuming the EIS is accurate. No, the EIS is guessing.

EIS Omissions

The Department of Ecology said: "Let us know what we omitted."

They omitted methane leaks from abandoned gas wells.

According to Bloomberg:

Gas companies are abandoning their wells, leaving them to leak methane forever.

Just one orphaned site in California could have emitted 30 tons of methane and there are millions more like it.

It would be good for Ecology to hear that often!!!!!!

https://www.bloomberg.com/news/features/2020-09-17/abandoned-gas-wells-are-left-to-spew-methane-for-eternity?utm_source=url_link&fbclid=IwAR2IZicvXTRm0jluzdnPfdE4m1iQ8b6ZXU4cArXgPekpctlmnX9CNsHHER0M

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Maureen Lawther

Deena T. Grossman

Dear WA Dept. of Ecology,

Please deny all permits to NWIW for the Kalama methanol refinery. If built it will emit 4.6 million tons of greenhouse gas per year every year for forty years. This is absolutely unacceptable. WA State and Governor Inslee are committed to reducing greenhouse gas emission and slowing climate change. Please don't allow this monstrosity to be built by the Chinese government. It will degrade the air, water and environment in the Pacific Northwest. Please rule against any and all permits to build.

Thank you for caring for the future of our earth, our children and grandchildren.

Sincerely yours,

Deena T. Grossman

Comment on the Kalama Manufacturing and Marine Export Facility Second Supplemental EIS

Christopher McElroy

The Kalama Manufacturing and Marine Export Facility (KMMEF) has a planned lifetime of 40 years, and the Second Supplemental EIS (SSEIS) takes this into account when calculating its lifetime effect on the environment. While lifecycle analyses are the current standard, they are not typically relative. For example, Apple doesn't report the lifecycle impact of its iPhones compared to other popular phones. If other phones are worse that doesn't mean that Apple's phones have a *negative* effect on emissions. Apple is responsible for its own emissions, and its phones' emissions by extension. By comparing the output of the proposed KMMEF to other current or hypothetical plants based on predicted methanol markets over the next 40 years, the Department of Ecology has created a misleading, unproductive, and highly questionable report.

The state of Washington is responsible for its greenhouse gas emissions, not those of other countries around the world. However, by highlighting the relative emissions of the KMMEF over its absolute emissions, this logic is broken. The SSEIS states explicitly that "if KMMEF sells 3.6 MMT per year to China, then the emissions for 3.6 MMT of methanol produced under alternate cases would be replaced with the emissions from the KMMEF-produced methanol each year" (page 50). This idea completely dismisses the effects of supply and demand on the size of markets, while implying that Washington residents are responsible for those hypothetical emissions just as much as the emissions from the KMMEF. This relative analysis does not make economic or environmental sense, and it should be revised to highlight the expected lifetime emissions of the KMMEF, not the relative ones.

40 years is a long time. The SSEIS assumes that "global methanol demand increases over the next 40 years" (page 50). This is a reckless assumption that is based on the current state of the industry without taking into account the larger sociopolitical and environmental state of the world. No regard is made for the requirements that are already beginning to be imposed by the Paris Agreement and other efforts to limit warming to 1.5 or 2.0 degrees Celsius. As one specific example, China recently promised to be carbon neutral by 2060. Such a goal does not square with a rapidly growing methanol industry—*unless they are outsourcing their emissions to America with plants like the KMMEF*. Promises to be carbon neutral or close to it in the next 20-40 years are growing rapidly, and are likely to only increase in extremity over the next 40 years. This leaves the future of methanol highly uncertain, and makes any study (including the SSEIS) that relies primarily on strong assumptions about the methanol industry in this time period extremely unreliable at best. If a relative report is required, any EIS should make clear the large uncertainty present in the future of the industry, and integrate these uncertainties directly into their predictions. A much more factual and good faith solution to this issue would be to avoid comparison all together, and report only on the lifecycle emissions of the KMMEF.

There are glaring issues with the SSEIS. I urge the Department of Ecology to reconsider the assumptions this Environmental Impact Statement is based on, and revise its methodology and reporting to reflect that. Arguing that the KMMEF will have a net positive effect on the environment requires ignoring obvious economic and environmental realities. You can do better.

Serge Gubelman

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

James Taylor
