Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

debbie thorn

CJ Livingston

Thank you for your work to protect Washingtons environment.

The new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel (despite deliberate efforts by NWIW to mislead your agency and the public otherwise). While the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread historical under-reporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia and the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this projects impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washingtons climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Alfred Ferraris

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

This, like numerous other issues (climate change, food labeling, gun safety, immigration reform,

prison reform, education reform, short-term lending regulation, healthcare reform, banking regulation, opioid regulation) remains a vexing problem primarily due to corporations' ability to curry favor with elected officials. The corrupting influence of money in our political system is undermining our democratic traditions and discouraging Americans from voting and/or running for office. This ominous development may well end our experiment in representative democracy unless we alter this decades-long trend. For the sake of the republic, we must amend the US Constitution to state that corporations are not people (and do not have constitutional rights) and money is not speech (and thus can be regulated by state and/or federal campaign finance laws). Short of accomplishing this, no other reform of significance will be achieved. The moneyed interests will turn any reform to their benefit, often at the expense of the nation as a whole.

Andrew Jackson

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Dr Demian

Hi:

The previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington was inaccurate and inadequate.

The new Draft Supplemental Environmental Impact Statement has some important improvements, the methane leakage rates continue to be low estimates given the widespread underreporting of leaks.

Despite these marginal improvements, it's dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades.

Further, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the largest sources of climate pollution in Washington.

Ecology should dismiss the speculative basis that this project could displace even more polluting facilities. Instead, it should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project, that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

Washington MUST DENY NWIW's proposal to build and operate this dangerous methanol refinery in Kalama.

Thank you.
Dr. Demian

R McClain

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Nancy Lewis

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Joan Smith

I oppose the building of a new mega plant at the Kalama Manufacturing and Marine Facility to manufacture fractured methane gases. This type of plant is only leading us in a backward direction and increases the pressures of climate change. Can you find a way to consider a green facility that instead adds positively to the electrical grid with wind, solar or tidal energy? Sustain life on earth with a better choice! Thank you! Joan Smith

Margaret Weant-Leavitt

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

John Astaunda

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

John Flynn

We are currently in the midst of a global pandemic, catastrophic wildfires in the western states, global warming, ocean warming, ocean acidification and sea level rise.

On top of all these global and national emergencies we are contemplating permitting a petrochemical refinery in Kalama, WA to add 4.6 million metric tons of greenhouse gas emissions per year to further intensify our climate crisis. In addition to the greenhouse gas emissions this refinery will also add 53 tons of toxic and hazardous chemical pollutants and 62 tons of fine particulate matter annually into our air.

Any short term economic gain construction and operation of this methanol refinery is not worth the long term damage this proposed project would have on our environment and health.

The pros and cons of this proposed project have been debated for years. In the final analysis we should base our decisions on facts, not on speculative analysis and unfounded, unproven assumptions.

Department of Ecology should not lock us into 40 years of greenhouse gas emissions and toxic air pollutants.

Just Say No!

Jamie Caya

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Susan Renhard

I oppose construction of the Kalama Manufacturing and Marine Export facility. Consensus of the world's scientists is that to prevent the world's climate from becoming worse we need to reduce greenhouse gas emissions to zero in less than ten years. We need to begin immediately for the sake of future generations. Building a new facility that will contribute huge amounts of greenhouse gasses to the atmosphere and will only further destabilize our climate and prove disastrous for our children and grandchildren.

Larry Lawton

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

CARMEN Minor

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Charles Breslin

As a former resident of NE Pennsylvania, I've seen first hand the land destruction, and desecration of drinking water that comes with fracking for natural gas, we do want this in the PNW, we value nature, we value renewables, we value the climate, and we value our neighbors. This would be a devastating blow to the region and to climate change prevention overall and I personally will not stand for it.

Eleanor Dubois

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Dixie Edwards

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jill wollman

MaryAnn Schwab

As a matter of law, all of our rivers belong to the U.S. Government and the aboriginal treaty rights are sacrosanct.

This was established in the 1950s litigation concerning the Pelton and Round Butte dams on the Deschutes.

WATER -- THE GIVER OF LIFE

"We each have a duty to the land in which we live.

We have all come from the earth. On death we return back to the ground.

And in the cycle of life, everything that is born always is connected with water,

Water is the giver of life." -- Pierson Mitchell, Washat Religious Leader

As Oregonians and Washingtonians we must continue to honor and respect the Treaty of 1855. We must work to protect the iconic salmon migrations.

Nova Berkshires

MARILYN BOYD

I am adamantly opposed to the Kalama Methanol facility!

We are in a CLIMATE EMERGENCY! Adding fuel to the fire by approving a methane burning plant in Kalama, is beyond reckless and dangerous...it is deadly.

My family suffers from asthma, which is exacerbated by air pollution and unseen gasses. We have already had too many trips to the ER.

Ecology's analysis demonstrated that this methane project would produce 4.6 million tons of carbon pollution each year, or more. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C.

Why should we allow a Chinese government owned company to further damage our own fragile air and water resources? The infrastructure to support this facility is not limited to Kalama. It's negative impacts from fracking and transport would further damage many vulnerable communities across the region and current guidelines are poor for leak monitoring, detection and reporting.

Please keep our health and children's future in mind as you weigh your decision.

I reiterate...I am adamantly opposed to the Kalama Methanol facility!

"Let us be the ancestors our descendants will thank" ~ Winona LaDuke

Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Arvia Morris

Thank you for your work looking into the previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington and acknowledging that it was inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement confirms that the Methanol refinery would produce enormous amounts of green house gas (GHG) pollution. Washington state has recently adopted GHG pollution goals and we can not build projects and use our precious Columbia River water front and water to continue to pollute our environment to the detriment of Washingtonians.

The new study does have important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise.

We need to stop using all fossil fuels in transportation and move to electrification of transportation. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel

export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution. Please deny the NWIW proposal in Kalama.

Damon Mills

As an American citizen, I thank you for your work to protect Washington's environment and acknowledge that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Jeff Ramsden

The fragile ecosystem we all share does not need more threats and potential destruction. Would love for my kids and my kids' kids to have some semblance of the earth that we grew up with. Please stop this madness of valuing money over the well-being of future generations.

Jeanne Crevier

I oppose the construction of the Kalama Manufacturing and Marine Export Facility. What problem is this proposal intended to solve? Is this the best you could do?

The consensus on the world's scientists is that stabilization of the earth's climate requires reduction of greenhouse gas emission to net zero in less than a decade. All members of the global community must take unprecedented action to limit global greenhouse gas emissions beginning immediately. Building a new mega facility that will contribute enormous amounts of greenhouse gases to the atmosphere will further destabilize our climate.

Ruth Hooper

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Dean Onessimo

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Susanne Murray

Ashley Lindell

I am a family medicine physician, mother of two children and long-time resident of Washington State. I am deeply concerned about Northwest Innovation Works' proposal to develop and operate a natural gas to methanol production plant and refinery in Kalama Washington. It is well established that fracking causes water pollution and habitat loss and increases earthquake risks. Natural gas pipelines carry inherent risks for leaks and spills. The operation of the facility itself would pollute the Columbia River and decrease air quality. And, perhaps most importantly, this project would lead to greenhouse gas emissions at multiple steps from escape of gases at natural gas wells to the burning of methanol abroad. As demonstrated by the devastating fire season here in the West, climate change is a public health emergency. I call on the Department of Ecology to do the right thing and reject NW Innovation Works' proposal and deny the Shoreline Permit. We owe it to our children to focus on truly sustainable options of energy production. This is not one of them.

Michael Pinc

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Rebecca Rose

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Melanie Palmer

Joseph Stenger

To the Department of Ecology,

I appreciate the opportunity to submit comments regarding the Kalama Manufacturing and Marine Export Facility Second Supplemental EIS. As a grandparent, a family doctor, and a very concerned citizen, I am firmly opposed to this project.

The arguments put forth in the EIS in favor of this project justify the environmental impact by presuming that the products of this project would prevent more severe fossil fuel pollution. In fact, this project would accelerate generation of fracked gas, causing much more climate-damaging pollution than at present. Despite the presumptive calculations in the EIS, there is no possible plausible justification for building a large plant to process fracked gas with the excuse that this will improve our environment. The arguments do not meet the believability standard. The climate is worsening rapidly due to fossil fuel extraction and burning- we cannot afford more of the same! Reassurance that the methanol will be used in plastic production rather than energy production is not credible. Once the plant was built, the managing corporation would act based on maximizing profit, regardless of their currently stated intentions.

Fracking has had calamitous effects on the regions of production. The practice has been damaging to the water and air, as well as associated with earthquakes. While the Department of Ecology focuses on effects in WA, the proposed project would contribute to further fracking efforts and significant environmental damage in those regions. A project built here that creates more damage there is still a terrible project.

We are living in a era of rapidly worsening climate instability. We have just lived through the worse air on record in the region due to unprecedented wildfires. Our forests are drier than they've ever been. We are seeing another catastrophic hurricane season. We are seeing fires in the Arctic, for God's sake! The polar regions are deteriorating more rapidly than scientists have predicted. We are in a crisis- we cannot afford to have more climate-destroying pollutants released into our air. Our air is a commodity owned by all of us. That cannot be further damaged to provide more profits to corporations.

We absolutely urgently need to be reducing use of fossil fuels like fracked gas and rapidly shifting to fully renewable production of energy. We also cannot afford further production of methane for plastic production. Every country, including the United States and China, must quickly reduce the extraction of these dangerous substances. Elegant but specious arguments about how this project with actually reduce GHGs are not tenable.

I live in Portland OR, 37 miles away. I care deeply about the health of our region. I will join many others in active opposition to construction of this plant if it were approved. I plead with you to uphold your obligation to protect the ecology of our region and to preserve some shred of a healthy environment for all of our children and grandchildren. You hold the power- do not let this monstrosity be approved.

Thank you for reading my comments. Please take them to heart and act appropriately.

Mark Bradley

Even with all of its flaws, this analysis confirms that NWIWs proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washingtons climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIWs proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

r wood

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. I can't believe that, in the wake of the horrible wildfires that just destroyed so many acres of forest in the Pacific NW, this methanol plant would seem like a good idea to anyone. Please deny this project from moving forward.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Jessica Fischer

No Methanol Plant! I live in and love the beautiful city of Kalama. My family loves this beautiful area and we fish for salmon on the pristine Kalama River. We don't want this destruction of our river and salmon habitat. The river will be impacted. Tacoma didn't allow this project and we do not want it here either. This will bring our property values down and will be an eyesore at the port. Only China benefits from this. We just get the pollution. 200 jobs will not be local. They're saying maybe 20% of the jobs may be local. They have already applied for visas for the rest.

Barbara Sim

It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Helen Dickey

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Julie Hungar

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. Randal Friedman

Aside from all the substantive impacts to Washington State's climate change program that others describe in depth and I agree with, this project would disrupt an emerging effort in Clark County to support development incorporating high levels of sustainability. This effort started with the proposed new HP 3D printing campus in East Vancouver.

A large group of stakeholders came together to not oppose this massive development, rather asking this development serve as the showcase for Clark County and SW Washington. They suggest clean technology is how we get beyond fossil-fuels. This new direction can create jobs directly, and indirectly through all the green services it would support.

The future of Clark County and SW Washington must be a sustainable path bringing new prosperity and leadership. This project would negate positive collaboration in its infancy.

The Department of Ecology must deny this project not just for all the significant impacts others have described, but also because it is the opposite direction Washington State must travel to meet its climate obligations. It's time for a new chapter in Clark County.

Mark or Uhart

I was disappointed the Second Supplemental Environmental Impact Statement (SSEIS) prepared for the proposed Kalama methanol plant didn't provide updated information on the potential effects the 4.6 million metric tons (MMT) per year would have on climate change and the survivability of Pacific NW shellfish, salmon and steelhead. The SSEIS references the U.S. Geological Survey (USGS) National Climate Change Viewer (NCCV) and states it "contains historical and future climate projections at county levels for the US. The viewer indicates that, in Cowlitz County, minimum temperatures are likely to rise and that both increases and decreases in precipitation may occur, depending on other variables."

What it didn't say, but was in the Final Supplemental EIS (FSEIS), was that the "Cowlitz County minimum temperatures are likely to rise by 3.8 to 4.3 degrees F and maximum temperatures by 4 to 5.4 F degrees by 2040." (See FSEIS Section 3.2.2 ♦ Greenhouse gases and climate change.) I checked the NCCV for Cowlitz County and the mean yearly temperature is expected to increase 5 degrees F by 2040. Juvenile salmonids released into the Columbia River, and adult salmon in the ocean, will not survive if water temperatures get much warmer, and it will with an increase of 5 degrees in ambient temperature.

Section 3.2 of the SSEIS also downplayed the effects of GHGs on climate change by stating, "Thus, equivalent GHG emissions originating from the proposed project would have the same effect as those from any other location (and vice versa). It is not meaningful to link a specific climate change directly to a specific emissions source." That's like saying they don't believe in climate change, because one huge hurricane hitting the Gulf Coast, or uncontrollable forest fires over a uniquely hot and dry summer in Western states in 2020, or a heavy snowstorm in Colorado in early September, don't in themselves prove climate change will impact Washington. We've heard this argument from the anthropogenic climate change deniers many times, but the IPCC (which was referenced in the same section), makes it clear that these GHGs will accelerate climate change. The above statement is also like saying it is not meaningful to link an infectious disease like COVID-19 to death rates on the other side of the world. The actions we take in the US, with respect to GHG emissions, will effect climatological changes in China, and vice versa. Air within the lower troposphere knows no boundaries.

In the FSEIS, "Table 2-1. Permits and Authorizations Required for the Proposed Project," with NOAA as the Agency and NEPA as the Permit/Authorization, it stated that there was a finding by NOAA of "No Significant Impact" in their assessment issued 10/24/2016. This is not a true statement.

The Portland office of the National Marine Fisheries Service (NMFS), subordinate to NOAA, rendered a biological opinion pursuant to section 7(a) (2) of the Endangered Species Act (ESA) on the effects of the proposal by the U.S. Army COE of Engineers (COE) in order to issue permits to the Port of Kalama for the construction of the KMMEF and lateral pipeline. It also included an essential fish habitat (EFH) consultation for the proposed methanol plant. The biological opinion and Magnuson-Stevens Fishery Conservation and Management Act Essential Fish Habitat Consultation listed 28 Endangered Species Act (ESA) threatened or endangered species within the

Action Area.

NOTE: "Action area" means all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action (50 C.F.R. 402.02) The Action Area includes the interrelated and interdependent activities related to methanol transport, and includes not only the KMMEF and lateral pipeline, but also extends downstream through the Columbia River navigation channel and into the Pacific Ocean where effects from ship traffic will occur.)

The NMFS non-concurred with the COE's 10/9/15 biological assessment (BA) report by stating, "In that letter, the COE concluded that the proposed action is not likely to adversely affect (NLAA) LCR Chinook salmon, UWR Chinook salmon, UCR spring-run Chinook salmon, SR spring/summer-run Chinook salmon, SR fall-run Chinook salmon, Columbia River chum salmon, LCR coho salmon, SR sockeye salmon, LCR steelhead (*O. mykiss*), UWR steelhead, MCR steelhead, UCR steelhead, SRB steelhead, and southern distinct population of eulachon. The COE also concluded that the proposed action is NLAA Snake River (SR) sockeye salmon (*O. nerka*), southern distinct population of eulachon and southern distinct population of green sturgeon (*Acipenser medirostris*), (hereafter referred to as green sturgeon). However, the NMFS non-concurred with DOE's BA report and stated, "Due to the short- and long-term indirect impacts caused by the proposed project, NMFS does not concur with the COE's determination that the proposed action is NLAA for most species. ... We also concur that the proposed action will adversely affect critical habitat for any of these species (emphasis added.)"

It should be noted that although NMFS participated in pre-application meetings with NWIW, the Port of Kalama, many state departments, and other governing stakeholders, the COE was not part of these meetings/discussions until 3/16/16, at which time the Corps informed NMFS that the DOE would be a cooperating agency on the project. Many meetings with these stakeholders followed between 10/21/15 and 9/27/17, collaborating on mitigation efforts, water quality and dredging, dredge disposal, outfall design and temperature discharge, ballast water and chemical constituents in the outfall discharge, and other concerns. This author cannot find any discussion among these stakeholders on mitigating GHGs, or the project's long-term effect on climate change. This is anomalous considering NMFS's non-concurrence with the DOE BA, whereas NMFS determined that the project was "likely to adversely affect" 19 of the 24 ESA-listed threatened or endangered species and their habitat.

It appears that many of the KMMEF construction-related effects can be mitigated through "Reasonable and Prudent Measures" and by following the proposed "Conservation Recommendations." But good governance requires methods of compliance and without surveillance and inspections during the two year construction period, by a non-biased environmental engineer, and oversight by Ecology, what assurance is there that these prudent measures and recommendations will be followed?

The greater concern is the long-term effects of 40-years of GHG emissions, which was the NMFS's primary reason for non-concurrence with the COE's BA. Ecology must take note that this facility will be responsible for a whopping 185 MMTs of unmitigated GHGs. The only acceptable mitigation would be to sequester 100% of the GHGs for which this facility will be responsible, from natural gas extraction to the burning of the methanol as a fuel, not just the in-state GHGs as proposed in the VMF. Ecology's decision will impact Washington and our iconic fisheries for not

just the next 40 years, but for as long as humans exist on earth.

Linda Ferland

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. Susan Haywood

Transporting LNG to Kalama is a risky business. Particularly during wildfire season, as the volatility of the gas means that it leaks in both tank cars and pipelines. We do not need to fuel the fires that are already exacerbated by climate change. We should not frack landscapes, flare off methane, and pollute air, soil, and water, in order to produce this volatile gas. Fossil fuels are no longer viable. They are currently a glut on the market.

Fracking is the dirtiest, most harmful oil production in the world. It is in our best interest as humans to stop production and transportation of LNG and methane/methanol. The methanol facility should not be built in Kalama; we need to preserve wilderness and habitat, not build a polluting operation that is going to turn the area's livable community into a dangerous and unhealthy environment. We are at a crucial time in history. Short-term profits that cause pollution and degradation of the environment are also causing long-term health effects. Short-term profits don't cover the long-term human costs.

Deny permits to move forward with this project. It is not in the best interest of the community. It is not in the best interest of the entire world.

Alison Eckels

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Aisha Farhoud

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Paul Ferrari

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Natalie Van Leekwijck

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Lisa Messinger

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Guila Muir

This project is one of the worst ideas around right now. Totally for profit for a few, the proposed Kalama facility would have a devastating impact on the climate. It would emit more than a million tons per year of climate pollution as part of the manufacturing process alone. Shipping the methanol to Asia would generate hundreds of thousands of additional tons per year of climate pollution. Additionally the methane emitted by fracking and pipeline transport to supply the facility would make the greenhouse gas impacts skyrocket even higher.

Please do the right thing and close the idea of this project down right now.

April Eversole

Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Ann McGill

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

Val Alexander

I strongly object to the proposal to build such a huge gas project at Kalama. As a resident just a few mile upstream from this proposed plant, and as a Native American, whose family is indigenous to this area, I am concerned about the surrounding habitats, water quality of the Columbia River, which is the life blood of our tribe, and the huge contamination resulting from the transport, fracking, and use of this product. Please do not allow this to happen.

Rev Burg

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Dan Snyder

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. A Obermeier

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jacquelin Jarvis

Theresa Schumacher

This proposed methanol plant would be a tragic mistake not only for Kalama and the State of Washington, but for the entire Pacific Northwest. It would become a huge polluter, not only alongside the banks of the Columbia, emitting massive amounts of air pollution, but also in terms of using fracked natural gas to supply its ginormous energy needs. The gas would need to be piped in from hundreds of miles away with every small methane leak resulting in pollution times worse than regular CO emissions.

NWIW originally claimed that the methanol produced from this plant would not be used for making fuel, but they were apparently lying when they said that, just as they are lying when they claim that this would be a great project, providing local jobs while also being "good" for the environment. The first SEIS was fraught with inconsistencies and incomplete information, just as this second one is. I urge you to please be a champion for the ecology of Washington, as well as the Pacific Northwest, and once and for all reject this toxic project! As the recent fires have shown us, there is nothing more basic to life than clean air and water...when that is suddenly gone, all people and living things suffer. Protecting the ecology of this region is the main responsibility here, not enabling dishonest companies to make money while polluting our precious natural resources. Thanks so much for taking the time to hear all of us out on this important topic.

Theresa Schumacher

Patricia Warming

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Ian Jezorek

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Don Steinke

Please update your calculations to include the emissions suggested by this report from Bloomberg:

Gas companies are abandoning their wells, leaving them to leak methane forever.

Just one orphaned site in California could have emitted 30 tons of methane and there are millions more like it.

https://www.bloomberg.com/news/features/2020-09-17/abandoned-gas-wells-are-left-to-spew-methane-for-eternity?utm_source=url_link&fbclid=IwAR2IZicvXTRm0jluzdnPfdE4mIiQ8b6ZXU4cArXgPekpctmX9CNsHHER0M

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jean Pauley

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Tracy Ceravolo

According to a report in Bloomberg, millions of abandoned gas wells around the country are actively leaking methane! Where is the money to monitor this? Are there federal regulations about it? Gas companies declare bankruptcy, and tax payers are left to pay for plugging these wells which can cost hundreds of thousands of dollars per well! And plugging it with concrete is not a permanent solution because the concrete degrades with the extreme pressure of the Earth. So for every well dug, you are dooming future generations to deal with our mess of leaking methane?!

How does this factor into your EIS?

George Ruiz

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Connie Dean

This is in opposition to the NWIW methanol refinery for Kalama, WA.

There are several reasons that many cities have turned down the Methanol refinery.

It will take a huge amount of electric power and water to run the refinery. And they want to push too large amounts through an existing pipeline that is not large enough.

There will also be tons of methanol on ships crossing the Columbia River and oceans on the way to China. There is the potential of leakage, which is likely to kill the fish and pollute our waters.

Kalama would have a huge plume from the refinery obstructing many peoples views. They built their homes where they are for the beautiful views of the Columbia River.

The refinery creates many opportunities for pipeline eruptions, ship leaks, leakage from their own tanks, pollution from the plume. Even the DOH admits that "methanol is a toxin" and is dangerous.

If the refinery goes in, it will ruin this lovely town. More people and animals will get cancers and other diseases. Our soil and air and water will become polluted. The quality of life in Kalama will change for the worse.

Notice that at this pre refinery time, the eagles have returned. That's because our air quality is good, but they will once again leave if the refinery comes in.

We all want good paying jobs for Kalama, but we want safe and healthy jobs. I know that better and safer use can be made of the land that is set aside for the refinery.

Connie Dean

Blake Wu

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

William Young

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. While the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project: that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Boni Biery

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been both inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility. Improvements include addressing the likelihood that methanol produced by this facility will actually be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public to the contrary. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low-ball estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia and the unrealistically low leakage estimates for that source, the analysis still confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading. It relies upon speculative and unenforceable assumptions. One can simply look to the impacts of the COVID pandemic to see evidence of the incredible uncertainty and volatility within energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades.

Furthermore, the SEIS provides far too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this proposed "voluntary" mitigation address the full impacts of NWIW's emissions which will occur overseas.

The mitigation framework is too vague to support an Ecology conclusion that this project's impacts will be mitigated. The urgency of climate change demands that all unavoidable impacts be addressed with mitigation as the last and poorest option as we continue to move beyond the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and the faint hope of theoretical emission reductions.

Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing

climate pollution.

Jörg Gaiser

Kathryn Lewandowsky

Are you nuts? Some scientists feel that we have less than 10 years to reduce our greenhouse gas levels. I think they are wrong. We need to immediately reduce our greenhouse gases. We're killing our home and everything in it so no this plant is not a good idea! Put your heads together and figure out something different to do!

Tabitha Thomasson

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Giles Sydnor

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Tracy Wang

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Barbara Lavery

I oppose the construction of the Kalama Manufacturing and Marine Export Facility. The consensus on the world's scientists is that stabilization of the earth's climate requires reduction of greenhouse gas emission to net zero in less than a decade. All members of the global community must take unprecedented action to limit global greenhouse gas emissions beginning immediately. Building a new mega facility that will contribute enormous amounts of greenhouse gases to the atmosphere will further destabilize our climate.

Nancy McMahon

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

We are down stream from this disaster in the making. Please reconsider, in an age when we are phasing out our dependence on non-renewable fuels this proposal is a financial disaster as well as a ecological and humanitarian disaster. I am sure the state will provide taxpayers dollars to encourage the site to be built...so you make citizens pay for their own poisoning. Interesting your disregard for that fact. As we continue to downgrade the importance of these products the plant will within 10 years be losing money...so there is no economic benefits just a black hole for taxpayers to pour money into

Alycia Staats

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Eric Jensen

I'm concerned that the review of the Kalama Manufacturing and Marine Export Facility Second Supplemental EIS will be based upon murky understanding of the pollutants involved. For starters, the process of delivering "natural gas" from the fields of the Great Plains of North America to the Asian plastics manufacturers would be unacceptably polluting and damaging. I've lived in Oklahoma and the fracking there has contaminated scarce ground water and is widely believed to cause an unprecedented sudden spike in earthquakes since fracking began in Oklahoma. Fracking requires a great deal of water and destroys usable water tables by injecting chemical-infused water into the subsoil. Also, natural gas wells are notoriously leaky when they operate. Afterwards, abandoned natural gas wells fume (leak) natural gas leaks forever. And the pipes carrying natural gas can leak. News stories regularly describe how our decrepit railroads and human error can cause fires and explosions such as happened in the town of Lac-Mégantic in Canada and Mosher, Oregon, recently). Also, the process of refining that gas into methanol creates more pollution. And for what? So the world can be burdened with more plastic products that are most often single use (for example, packing materials, styrofoam and plastic bags). The US is far worse than giant polluters such as China in lax regulations of fossil fuel refining and use. Our decisions should be made with realistic understanding of the relationship between climate change and pollution. The review process for the Kalama Manufacturing and Marine Export Facility should rely on evidence-based information, not the gas industry's short term incentives such as temporary construction jobs. The false choice between jobs and plastics production should not be considered a valid choice. The evaluation of the proposed Kalama methanol facility should result in principled decisions about what the natural gas industry should be allowed - and not be allowed - to do with our precious and delicate environment. Thank you, Eric Jensen

JOSEPH BARRECA

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Donald Wilson

Jilda Nettleton

I am sadly writing to oppose the construction of the Kalama Manufacturing and Marine Export Facility. As much as I understand the need to have manufacturing facilities across Washington state, we also have to address climate change. The consensus on the world's scientists is that stabilization of the earth's climate requires reduction of greenhouse gas emission to net zero in less than a decade. Part of the reason we have to take such drastic action now, is because for so long corporate interests along with the Republican party pushed an agenda of climate change denial. So now we all must take unprecedented action to limit global greenhouse gas emissions beginning immediately. Building a new mega facility that will contribute enormous amounts of greenhouse gases to the atmosphere will further destabilize our climate.

Kathy Phillippe

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Phillip Norman

Deluded actions for self-interest of a few greedy investors can not prevail against common sense and the actual self interest of all of life on Earth. We, the people, the animals , the trees, all that has evolved in nature, have the moral high ground against frackers, however much stolen money they parlay as noble "business." Nobility is in raising the prosperity of creatures far into the future, not foreclosing that future. A methanol refinery fed by fracking, ruins embodied nature, forever. Fracking is pure evil and is not wanted. Producing artificial demand for fracking, is more evil than the fracking.

Danell Norby

Governor Jay Inslee endorses bold action on climate change in Washington, but permitting of the Kalama facility would signal the opposite.

I am an individual who lives in Portland and works in Vancouver, WA. The recent wildfires have only increased my frustration that our local, state and federal governments are not taking substantial action to reduce our reliance on and support for fossil fuels. The displacement of thousands of families, skies clouded with toxic smoke--it is terrifying to think of this situation becoming more and more common as climate change contributes to the drying out of our corner of the country, increasing the danger and destruction brought by wildfires.

I urge the Dept. of Ecology to NOT issue a permit for the Kalama Manufacturing and Marine Export Facility. To do so would only be to perpetuate our current status quo of fossil fuel reliance, instead of seeking the cleaner energy alternatives we will need to avoid the worst impacts of a climate disaster.

I understand that the economic implications for Cowlitz County are significant if this project does not move forward. However, the Kalama facility would be one of the 10 largest sources of greenhouse gas emissions in Washington. I urge you to weigh the local economic benefit against the statewide, regional and global environmental ramifications outlined in the SEIS report, as well as the harm inflicted by disasters and other consequences of climate change on current and future generations.

Sharon Sollenberger

I am opposed to the development and operation of a natural gas to methanol production facility at the port of Kalama. The production of millions of tons of CO₂ is not acceptable when we need to be reducing our emissions by 9% for the next 30 years to reduce the impact on climate change. Other cities in the U.S. in California and on the east coast are developing policies to ensure new construction of all electric. In addition there have been incidences of gas companies abandoning wells, leaving them to leak methane. Please consider other cleaner options for producing energy and making products that Washington state and other states and countries need. It is a matter of priorities and doing whatever we can to mitigate global warming is of the utmost urgency.

Dennis Underwood

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Carol Whitehurst

Jennifer Owen

I am very concerned about the environmental impacts of this project. The people of Washington and Oregon want clean safe energy, not the continuation of fossil fuel and its pollution of our world. We have options and as we look to the future we owe it to ourselves and our children to explore them.

L Bechtel

I am totally opposed to the Northwest Innovations proposed Methanol plant.

Fracking of gas for this project destroys the environment, contributes to earthquakes, and pollution on its own. Greenhouse gas emissions needs to be reduced. With this plant we are adding to.

Now China wants to built a plant that can destroy our city with one explosion. Add to that the fact that they have been deceptive all the way through. First it was to mitagate their pollution. Then the assurance was to develop plastic and not use for automotive fuel, and now that has changed too. Either way our dependence on plastics and fossil fuel needs to be reduced not added to!

Let's talk about the Salmon runs that our area is so dependent on, the impact will be great. Noise and light pollution alone will have a major impact on their ability to hide from predators. What about a spill, it's only a matter of time.

The impact on wildlife, on humans and on our air is not worth the dollars and few jobs it may bring. Do not destroy our way of life, our waters, and our Northwest for the profit of China!

Lee Stafford

Nancy Boxer

Just thought I would add a viewpoint from Pennsylvania, which has become one of the largest fracking states, and as a result has seen our greenhouse gas emissions grow enormously. Wellheads, pipelines and facilities all leak natural gas and methane, and since it is often difficult and expensive to find the leaks, they go unfixed for years. Pipelines run through neighborhoods and near elementary schools and hospitals and many people develop environmental sickness. Does Washington seriously want to meet the carbon goals set under Governor Inslee? Allowing the Kalama facility to go through would most likely result in MORE, not less, greenhouse gas emissions. Thanks for allowing me to comment. Nancy Boxer, Managing Director, Association for Climate Health.

Marie Marrs

Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

It's my understanding that the proposed facility would use a staggering amount of fracked gas and quickly become one of Washington's most significant sources of climate pollution.

Under every possible scenario, the pollution impacts of this project would be enormous. We need, now more than ever, to be focusing on clean energy. I vehemently oppose any facility that

perpetuates the use of fossil fuels.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Vivienne Bembridge

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Sharon Rickman

I am urging you to reject the proposed methanol refinery in Kalama. Building a new fossil fuel infrastructure refining fracked gas is wrong and will negatively impact all of us and future generations.

I lived in western PA and witnessed first-hand the harms of fracking to air and water quality. The oil and gas industry built fracking wells on our local small farms –targeting a vulnerable community with empty promises. When the farmer's entire ecosystem was poisoned from hundreds of trucks hauling in water and hauling out toxic waste, pumping toxic chemicals deep into the ground, and building open-air evaporation ponds, the oil and gas industry's response was "Prove to us that the air and water was not contaminated before we came here."

This SEIS statement does not address cumulative upstream impacts of all phases of fracking including emissions to truck in vast amounts of water, truck out toxic waste water, operation of compressor stations, storing poisonous water in open air ponds, and the cumulative health impacts from the toxic fracking chemicals/process to people, animals, and land.

We need new, sustainable, clean energy jobs in WA. Building a new fossil fuel infrastructure to refine fracked-gas will not provide that. Please do the right thing and reject this proposal, and all permits to stop this dangerous project.

Phillip Norman

Export of methanol is just another scheme to profit from thieving destruction of land owned by no one. The profit is mainly to a few greedy people, leveraging stolen wealth, not to average persons innocently buying related investment funds. It is all just greed in action. It is not about supply of energy demands. It is about push of spoils converted for greater returns in Asia. It is about enabling jobs that the greedy exported elsewhere. It is not at all about local jobs or the good of ordinary people anywhere.

Joanne Mayhew

The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Andrew Altamirano

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Lynn Lichtenberg

I oppose the construction of the Kalama Manufacturing and Marine Export Facility. The consensus of the world's scientists is that stabilization of the earth's climate requires reduction of greenhouse gas emissions to net zero in less than a decade. As scientists at Ecology well know, we must begin removing carbon soon to stabilize our climate. We can do this! All members of the global community must take unprecedented action to limit global greenhouse gas emissions beginning immediately. Building a new mega facility that will contribute enormous amounts of greenhouse gases to the atmosphere will further destabilize our climate. This facility must not be built.

Shana SUNDSTROM

I am adamantly opposed to the proposed Kalama methanol refinery. First, the amount of CO₂ emitted by this project is staggering and unacceptable in a time of severe human-caused climate change. If elected officials do not accept that human-caused climate change is real, then such irrational and ideological folks have no business being in office. I find the idea of allowing a project like this to move forward morally repugnant, although I recognize that that is not a legitimate reason for WA to reject the refinery. Burning gas may be an improvement over coal but is a far cry from electric energy and inflicts human and environmental harms in multiple dimensions. Furthermore, virtually every EIS statement ever has underestimate the harms caused by fossil fuel projects. In part, this is because so many harms are externalized. Is the taxpayer burden from the increased health care required to treat the significant rise in asthma and other related health burdens as a result of both the direct activities of the refinery and the secondary impact of burning the gas taken into account? No. Is the long-term vulnerability of WA and the US to food, energy, and water security as a direct result of climate change accounted for? Many harms are underestimated, represent guesswork, or are simply not included. Finally, for the proponents of this project to argue that 'if we don't build it, China will', is terrible logic. Shall we also exterminate all the minke whales in order to make profit that would otherwise be harvested by Japan under the guise of 'scientific' activities? Arguing that we should do something harmful because if we don't, someone else will and they might cause even more harm, is a disgusting and immoral stance. We need to do what's right, even if no one else is. And in fact, even China is taking aggressive strides to wean themselves from fossil fuels. Please reject this refinery. It has no business in Washington, or anywhere else in this country.

Melodie Scholz

I am writing in opposition of the methanol plant. I have lived in kalama my whole life ,as well as my parents and grandparents. My main concern is the environmental Impact. Just the fact that this is the largest methanol plant ever built and that they picked a tiny little town like Kalama makes me assume that the bigger cities had reason for concern as to why they passed on the deal. The Port of Kalama is in my opinion ,being very naive in their thinking. These big foreign companies are not being honest about their intentions. I honestly believe it should be illegal to allow the port to make this decision for all of us. One example of how our waters and air are already polluted in kalama would be 4 leukemia cases within a mile radius of the port of kalama , one of them was my 14 year old son. One widely known effect of benzene (which is omitted currently from kalama chemical plant) is the development of blood cancers. I fear that adding a huge plant that will release even more benzene into the air will contribute to so many health problems for not only Kalama but Cowlitz County and the other residents that reside near the Columbia River. There are so many scary unknowns. Thank you for your time.

Melodie Scholz , kalama resident

Linda Shirley

I oppose, most strongly, the permitting and Building of the Kalama facility. The last thing this country needs is a way to create and support more climate destruction.

Jeff Hebrank

Please help our state address the issue of climate change by not allowing a natural gas to methanol plant. The Supplemental Environmental Impact Statement for the Kalama Manufacturing and Marine Export Facility must address the fact that building new plants will not allow our economy to de-carbonize fast enough to prevent future climate catastrophe. Fracking the gas, transporting it (with leaks), shipping the methanol overseas, and then making more plastic with it, is all bad for our environment, every step of the way.

Addressing climate change is the biggest challenge humanity has ever faced and it will require action from every country. In order to transition away from fossil fuels our country will require a mobilization unlike anything seen since World War II. Building additional plants to process fossil fuels is a step in the completely wrong direction.

Thank you,
Jeff Hebrank

Susan Goldberg

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

MARRENE JENKINS

Most of you have heard the phrase "an ounce of prevention is worth a pound of cure". Now, have you lived it? Have you lived DAILY with toxic clouds of industrial waste? In the summer and when the weather is warm in fall and spring, it's more oppressive because the warm holds the AIR POLLUTION closer to the earth. Maybe you can relate to this in light of our recent forest fires which brought toxic smoke into our environment on the winds of a natural phenomenon. Over recent years, industrial, vehicle, and even tobacco products, which grossly affected air and water pollution have been greatly reduced. Those are the results of applying the ounce of prevention through the work of the EPA and state departments of ecology.

The ideal began in the 1950s but became fact finding groups in 1970. Back then the mission was easy to identify, but the "cure" solutions were met with strong resistance. The EPA and depts. of ecology per each state were thick skinned, relentless in pursuit of restoring clean air and water. I imagine many of your own parents, grandparents, and other relatives were a part of this activity. Today clean air and water is much more sophisticated because going from the local affect to "Green House Gases" requires monitors. monitoring, scientists to read and interpret these readings and practical applications for years/generations to come. This all came about because it was due time. The Washington Dept. of Ecology has identified the negative enormity of the proposed project, from the day it would be completed on the shores of Kalama and for years after the day it closes. Just look at Hanford. I know this is so bad when YOU identify gas leakage starting at the wells. leakage when transported by pipes or trains, leakage when manufactured in the refinery including transferring to ships, leakage transporting to China, toxic byproducts when manufacturing into plastics and transporting back to U.S. in some form of a finished product.

Please DO NOT issue a permit for KMMEF

The complexity of this is weird! From a business perspective it lacks credibility unless your intention is to reek havoc on the U.S. The statement it would be better to have it done here, because we have higher standards to control (pollution) and if we don't do it someone else will do it anyways is rather vacuous. Please no permit since

Linda Carroll

As an environmentally motivated voter, I thank you for your work to protect Washingtons environment and acknowledgment that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Eric Esposito

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Kathleen Martin

Please don't do this to our town, our rivers or our environment! This plant will not create the jobs promised. It, as every plant ever built before will leak at some point, and the people here will have to deal with that, will have to live with that. This town is trying to build for tourist, how many would want to come visit, only to see huge plumes of exhaust, realize our fish population no longer exist, or that the eagles we now see have left us? There is no "safe" way to transport the fuel in, or out along the rivers. There are always leaks, along every pipeline, with all ships eventually. A few, very few, jobs for locals is not worth poisoning our rivers or land. We should not be hurting ourselves and our environment so that a foreign country can make more of something, plastics, that the world already has too much of. Just say NO!

Joan Agro

It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Leslie Limberg

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Aloysius Wald

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIWs proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIWs emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this projects impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Niki Vogt

The last thing WA needs is a massive pollution generating methanol refinery at Kalama. This project takes us in the exact opposite direction of where we need to go. We need to be embracing sustainable green projects rather than backwards looking fossil fuel installations.

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

William Malloy

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Eric DeBolt

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Gerritt Baker-Smith

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Minh Nguyen

I'm against Kalama Methanol Project. This is a disaster waiting to happen and will set the precedent for generations to come. Climate change is real and we need to work together to combat this crisis instead of contributing to it. This project will not only negatively impact WA, but the whole Pacific Northwest. This project is a morally reckless approach to the climate crisis at hand. It would also cause a huge amount of climate pollution, please believe in the Science and vote against this project.

Aimee Thompson

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Megan Hill

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Col Pederson

I am AGAINST this on so many levels- fracking is a PROVEN disrupter of the environment. 1-let's start with CLEAN WATER, which is a resource that is becoming in shorter supply. 2-And the release of toxic chemicals into water and air. 3-AND for which planned use is to make PLASTIC which is already harming sealife and environment!! 4- and the quakes which often follow. The risks have been under-reported/minimized to promote industry. *SAY NO to this project!!

<https://www.forbes.com/sites/judystone/2017/02/23/fracking-is-dangerous-to-your-health-heres-why/#6330dc365945>

Danielle Jokela

Comments regarding the proposed methanol plant in Kalama:

The proposed methanol plant in Kalama would be an ecological disaster for our entire planet. It would cause millions of tons of greenhouse gas pollution, use millions of gallons of water from an aquifer connected to the Columbia River each day, pollute the air with cancer-causing emissions, and pose safety hazards during an earthquake. The refinery would use more fracked gas than all the gas-fired power plants in Washington, combined, meaning the refinery would induce new fracked gas pipeline expansions throughout the region, or require even more dangerous oil and gas trains to bring this dangerous material through the Columbia River Gorge.

As Americans, we need to be looking forward to the future. Fossil fuels are the energy of the past, they will not continue to sustain our nation or our planet. The rest of the world has begun to awaken to the realities of climate change. China, India, the EU, are all realizing the economic disaster, not to mention the human toll that climate change will cause. Those markets may look flush now, but they are all moving towards a truly clean energy future. China, for example, has enacted some of the most stringent emissions standards in the world, and they continue to tighten those standards each year. 50% of all new construction in China must meet a strict and well defined "green standard", and they have developed policies that incentivize local municipalities adoption of greater use of renewable energy sources.

Building the world's largest methanol plant on the shores of the Columbia River would be continuing to deny and ignore the real impacts of global climate change. It endangers the health and safety of millions of people who live, work and play in this rich watershed. It claims to create jobs, but those jobs are not the kind of jobs that will sustain the community in Kalama, or in Washington long term as the world is moving away from use of fossil fuels making the need for such a plant obsolete. The total ecological impact of such a project is enormous: damage to land and ground water caused by fracking, degradation of air quality caused by emissions from fracked gas and the process of turning that gas into other products, vast amounts of carbon dumped into our atmosphere driving global temperatures to increase, plastics that survive on this planet centuries longer than the humans who use them.

The Portland Raging Grannies join many other organizations in opposing the Kalama Facility. We are concerned about environmental impacts, both immediate and future. Please re-evaluate the project with a source to destination view.

Rick Pietrusiak

I have read and agree with the statement below ... this project should not go forward. Thank you. Thank you again for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Janette Favro

Katherine Chesick

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We have this year stunning evidence of the occurrence of climate change, with massive wildfires yielding hazardous air up and down the west coast, numerous hurricanes and storms in the southeast, heat waves. Why are we even considering construction of a refinery that feeds into this climate disaster?

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Katherine Chesick

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Sally Jo Gilbert de Vargas

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. The world's largest fracked-gas-to-methanol refinery has been proposed for construction in Kalama, WA, along the Columbia River. When operational, this plant would turn fracked gas into the raw materials for cheap plastic which would then be shipped to Asia to be made into myriad myriads of plastic products. While operating, if it is built, it will contribute by itself fully 5% of Washington State's total carbon emissions, at a time when we are trying to reduce our greenhouse gas emissions. Haven't we seen enough evidence of climate change to take this situation seriously? Haven't we destroyed enough of Mother Earth's gifts to us? Haven't we done enough damage to our home in the service of "the Almighty Dollar?"

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Court Olson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

The paragraphs after this one were drafted by Earth Ministries --a strong and trusted voice in the religious and environmentally conscious world. I wrote this one myself. We have a moral imperative to reduce global greenhouse gas emissions rapidly to avert a centuries long and life threatening change in climate. We must cut those emissions, not grow them which is what the Methanol Refinery in Kalama would do. Even proposing it is shameful. It is a sign of the selfish greed of Northwest Innovations Works. We can't let this happen. I've researched this subject extensively and these are my words. Thanks for listening.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Take the food away from the sumo wrestlers that are in control.

Sarah Farbstein

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Terri Dundas

Virginia Van Zee

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Virginia Van Zee

Nancy Horman

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. I am surprised this project is even being considered in Washington State. We are believers in a clean climate. We are proud of our beautiful surroundings. I am 94 years, a retired primary school teacher. I have children, grandchildren, and great grandchildren living in this State. I want this project stopped for them, their future. And sending polluting gas to other countries only spreads the pollution world-wide.

I do feel for the people of Cowlitz County - loss of logging and other jobs. But why not try to find investments in solar and other conservation jobs? Washingtonians are creative people. Open up chances.

Please consider the futures of the children.

Thank you,

Nancy Horman

Seattle, Washington

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

NO NO A 1000x NO

Christina Scheuer

The permit for the Kalama methanol plant should be denied. This project works directly against our climate goals. It will lead to increased pollution and greenhouse gas emissions, and it will have negative impacts on the Kalama community. We need to transition to clean energy and stop supporting dirty, dangerous fossil fuels.

Susan Towle

With our planet literally at grave risk, it is unconscionable to build this methanol plant. All the research and data points to the enormous ill effects this project will create if approved. Do not do this! Do the right thing!!

Janet Ceballos

Please stop the building of this methanol plant. The ecological impact in our state and the financial state of the local community is in danger. Not to diminish the emotional injury if the cemetery is impacted. Please stop the building of this plant. We don't want to be locked into fossil fuels for eternity.

Mckenna Morrigan

Annalisa Ochiltre

As a state and a nation we need to be investing in green energy, not something like this that will so substantially increase greenhouse gas emissions in washington state. I am deeply apposed to this project going forward.

m'lou christ

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

And more analysis shows there will still be way too much pollution to warrant approving this project!!

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Katharine Harkins

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Keren Berry

Please do NOT allow this project to be constructed. The environmental impacts far outweigh the benefits.

Joleen Strunk

Please do not allow this plant to be built here in our quaint little city of Kalama. There are so many reasons why this is bad for the residents here. It will be a disgusting eye sore. I can't imagine the property values not decreasing due to this. Potential health hazards, noise pollution, and who knows what else. This is the problem. The residents do not know enough about this corporation who is trying to barge its way into a perfectly nice place to live. I am afraid it will not be a nice place to live if this company comes here. I did not buy a home here to be surrounded by such a monstrosity. These companies are not trust worthy. They have no conscious or morals. They have no concern beyond money. This is very sad that Kalama may allow such an injustice. The only benefit to the people of Kalama and surrounding areas are potential jobs and we have no idea if they will be or be worth a damn.

Mona McNeil

I am totally opposed to the Kalama Methanol terminal.

I have lived in Vancouver for 32 years and am a retired Clinical Psychologist. My late Husband, Randy Kleinhesselink, was a Social Psychology professor at WSU and WSUV For 43years.

The estimates of environmental impact relies on predicting future behavior of individuals and nations globally.

I can tell you that even predicting future behavior of one individual is very problematic. Just think of people you know or family and community members who have behaved in very unexpected ways. When you add in more individuals, creating groups with different histories, different sensitivities, different belief systems, different systems of government... The complexity increases and predictions become more difficult.

Add in external factors, like natural disasters, wars, pandemics... Predictions become less accurate. The EIS is trying to make predictions for the next 40 years!

If it were a trivial matter, predict away and see what happens. But this is an earth-altering project and overly optimistic predictions lead to disastrous consequences.

Your LEAST harmful estimate is that this project will release a minimum of 4.6Million Tons of CO2 each Year for 40 years!

Forget what other hypothetical decisions by other countries might do over 40 years!

Another issue is that NWIW will lead to Chinese output of either plastic or fuel.

We need to keep moving toward Clean energy and good jobs in that pursuit

Even Fox News reported on 9/20/20 that an article in Science found "53 trillion tons of plastic will be in earth's waterways by 2030"!!! Let that sink in.

Mitigations according to the Fox News report include REDUCING production of plastic waste by 25-40%.

The Fox News article concluded that plastic pollution in our world's oceans could have a \$2.5 Trillion impact, disrupting "almost all marine ecosystems".

For these, and so many other reasons, please put this project in its grave.

Thank You, Mona McNeil, Ph.D.

Jackson Ogden

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing

climate pollution.

Luan Pinson

The methanol produced by this project would be shipped overseas to be used/burned as fuel or to make plastics. Both of which we don't need more of polluting our environment.

The State of Washington is trying to move towards a clean energy economy and this project would greatly undercut that attempt.

NWIW lied to local and state regulators and they claimed the millions of tons of methanol produced each year would not be combusted as fuel. They then told investors about the potential for the use of the methanol for fuel.

We should be moving away from fracked gas, not embracing it. This project would use more fracked gas than all of Washington's gas-fired power plants, combined.

We have been lied to and this is a dirty, dangerous climate changing pollution producing project.

Ann Lewis

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Kurt Fox

I am submitting my opinion on The Second Supplemental EIS for Kalama Manufacturing and Export Facility. I am against this. We should not start any new fracking projects. They damage water quality, increase risk of earth quakes, and increase green house gas emissions.

Kerstin Rogers

The creation of a Kalama methanol facility is an unacceptable action in our state during this time of climate change crisis. We are living in the midst of catastrophic wildfires and storms that are increasing in frequency and severity and dangerous climate change effects are happening at a surprisingly quick pace. We would be extremely foolish to allow this plant to move forward as it would increase overall Greenhouse Gas emissions, both in Washington and likely in Asia, when you consider all the upstream and downstream factors. That is an irresponsible decision!

We should also stop contributing to the production of plastics that are poisoning our bodies with chemicals that mimic estrogen, causing diseases like breast cancer, and that end up in our oceans or in landfills for 1,000 years until they biodegrade. We must change course and use alternative fuels and products in the years to come. I demand that as a citizen of Washington State.

Sincerely,

Kerstin Rogers

Nathan Fritz

Please do not let money motivate a decision to forward a project that will further contribute to the destruction of our beautiful state. The emissions will only contaminate our air, water & land! Please do not do this just to make more \$\$\$\$!

Mona McNeil

I am totally opposed to the Kalama Methanol terminal.

I have lived in Vancouver for 32 years and am a retired Clinical Psychologist. My late Husband, Randy Kleinhesselink, was a Social Psychology professor at WSU and WSUV For 43years.

The estimates of environmental impact relies on predicting future behavior of individuals and nations globally.

For these, and so many other reasons, please put this project in its grave.

Thank You, Mona McNeil, Ph.D.

Craig Heverly

It seems the argument being put out by this study goes something like this: "If we don't pour our gas on this fire, someone else will and they will pour more than us. So, isn't it better that we pour ours first?"

The point is, no one should be pouring gas on the fire. The fire is already out of control and the only way to quench the blaze is to stop fueling it. And fracked gas and methane are frightening fuels.

With the planet blazing like Hell, what insanity to even toy with building this monstrosity! Please, think again. Put a stop to it once and for all.

Charlie Weir

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Pete Weymiller

According to a consensus of global experts in science, economics, and national security climate change is the greatest threat to our health, natural resources, national security and future economy.

Extracting, transporting and burning fossil fuels not only pollute the land, air and water they are the biggest contributor to climate change.

Fossil fuels already endanger our health, natural resources and economy. I have just breathed seven days of some of the most polluted air on earth that was caused by the forest fires generated by climate change.

Our precious fresh water resources are threatened by fracking for natural gas. And the risk of major explosions from natural gas has already been exposed.

With nearly 200 new residents to the NW each day we need to promote sustainable energy resources that we have already developed, ones that have made dangerous fossil fuels like natural gas obsolete.

Elizabeth Gronert

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Robin Moore

Pete Weymiller

According to a consensus of global experts in science, economics, and national security climate change is the greatest threat to our health, natural resources, national security and future economy.

Extracting, transporting and burning fossil fuels not only pollute the land, air and water they are the biggest contributor to climate change.

Fossil fuels already endanger our health, natural resources and economy. I have just breathed seven days of some of the most polluted air on earth that was caused by the forest fires generated by climate change.

Our precious fresh water resources are threatened by fracking for natural gas. And the risk of major explosions from natural gas has already been exposed.

With nearly 200 new residents to the NW each day we need to promote sustainable energy resources that we have already developed, ones that have made dangerous fossil fuels like natural gas obsolete.

Sally Hurst

Kalama is a small community. A blip on the radar when compared with other population dense areas. We are only three exits off the i5. A McMenamins recently installed along our gorgeous river front walkway has turned us into a desired 'let's get out of the city' destination. We have a small, river front ampetheater for summer concerts in the park. We have families with 5 generations of residents. The proposed Methanol plant will change everything about our community for the worse and it's not even for our benefit or for the benefit of America. I drive an electric vehicle and care about Global warming and our planet. The last thing I need in my backyard is something to make more plastic. Please consider the residents and future generations of this little town and decide against the permit for this plant.

David Cordero

Mary Slowik Siciliano

Dear Members of the Department of Ecology,

Please deny the NW Innovation Works most recent permit application. We need clean air. We need safe air. The last few weeks here in Vancouver, Washington, have been proof of that. We have horrific evidence now of the effects of greenhouse gases in our state, and also in Oregon, and in California. We also have evidence that smoke and fire do not recognize state lines.

Methane is a gas that also does not recognize state lines. Methane leaked from pipelines and fracked gas wells, and methane, converted into methanol in Kalama and then burned once more as methane in China (which NWIW now admits will be the case) is still methane. And the methanol produced more efficiently and with more care in the Kalama plant will not be color-coded so it will be recognized as "safe" methane. Methane is methane and is a more damaging greenhouse gas than carbon dioxide. There is no safe way it can be burned anywhere and in any amount in our current environment.

Please deny the Kalama permit once and for all.

p perro

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Daniel Roberts

Sometimes the allure of perfection eclipses the possible. The dream of a giant leap threatens an incremental step.

KMMEEF's Draft SSEIS demonstrates that its proposed methanol plant is an important incremental step.

The Draft SSEIS, using foreseeable variables and thoughtful and exhaustive analyses, demonstrates many things, among them:

1. KMMEEF's proposed methanol production will reduce net GHG compared to using current alternatives to fill the demand.
2. Worldwide demand for methanol is projected to increase over the next several decades.
3. Whether methanol is used as fuel or olefin production, KMMEEF's methanol production is better for the environment than existing sources.

As a health care professional, I have previously looked carefully at the health effects of methanol manufacturing, reviewing the medical literature of the past several decades. Because the toxic effects of methanol have been well documented and the physiology well understood, appropriate safeguards limiting exposure have long been in place. As long as these are maintained, the process is safe both for employees and for the community.

Furthermore, the science confirms that methanol poses much less risk to the environment than petroleum products because it is water miscible, disperses rapidly, and is much less toxic to life forms other than primates.

As an environmentally sensitive retired physician, it is apparent to me that KMMEEF has made a compelling case that its planned facility will result in less global GHG emissions and deserves ecology's approval.

Cheryn Zimmer

Rich Doenges
NWIW SSEIS
Washington Dept of Ecology
PO Box 47775
Olympia, WA 98504-7775

Mr. Doenges,

I am writing today in support of the methanol facility in Kalama, proposed by Northwest Innovation Works. The draft Second Supplemental EIS report released by Ecology has again upheld the assertion of a global greenhouse gas net benefit. I believe the process should be completed and permits for the project approved without further delay.

Cowlitz County is a rural county that has seen high unemployment for decades. The economic impact of this project would be in the form of the creation of many new family wage jobs along with tax revenue for critical community resources.

The benefits from both the environmental and the economic outcomes make this project one that should be a priority for Washington State. The science behind the environmental impact study has answered the question of environmental benefits, and given the events of this year, the economic benefits are of vital importance to Cowlitz County.

I would ask that you consider the prompt approval of this project and allow the process to go forward without further delay.

Regards,

Senator John Braun
20th Legislative District

R G

I am extremely concerned about our air and our planet. We need to stop building and operating new facilities that contribute to increased greenhouse gases being emitted. I have a child and find it unacceptable that she is growing up to live in a world that is being ravaged by climate change due to increased GHG. DO NOT approve this facility to be built!

David Hupp

I testify in opposition to the proposed Northwest Innovation Works (NWIW) Kalama Manufacturing and Marine Export Facility in any form. NWIW proposes a similar facility in Oregon and I oppose that as well.

I have lived in the Pacific Northwest for more than half a century, am certain of and share its strong values about the environment and democratic government. I feel these values are being threatened by the fracked gas industry in general. The Kalama Manufacturing and Marine Export Facility proposal is the latest of those threats to Washington, Oregon and our unique national treasure, the Columbia Gorge. Those threats include, but are much more than, the inevitable leaks, spills, fires and explosions. They include massive emissions of greenhouse gasses that will completely compromise the states' ability to meet their official carbon emission reduction goals and create a sustainable energy future.

The NWIW and its investors and allies represent substantial corporate wealth and possess the ability to hire skilled public relations. They will say anything to get this project approved and I don't believe anything they say. The corporate owners are not from the Pacific Northwest, do not understand our culture and environment, nor do they have our community interests at heart. The current SEIS (Draft Second Supplemental Environmental Impact Statement, Publication 20-06-011 dated September 2020) is so full of distracting analysis and turgid language as to be useless as a document for citizens. Its conclusions are highly flawed. In some respects the SEIS reads like a NWIW puff piece. In my work life I read many EISs and wrote a couple, so I know the game. I do not understand why the Washington Department of Ecology seems to be doing NWIW's work for them.

THE CARBON LOAD

The SEIS states the NWIW annual carbon emissions would be 4.6 million metric tons (mmt). The goal set in Washington law, updated in 2020, specifies "The state shall reduce ... overall emissions of greenhouse gases in the state to 1990 levels, or ninety million five hundred thousand metric tons" (<http://lawfilesexternal.wa.gov/biennium/2019-20/Pdf/Bills/SessionLaws/House/2311-S2.SL.pdf?q=20200919150040>).

Kalama's emissions are nearly 10% of the state's total emissions goal. The emissions also exceed the combined total emissions of 8 NW cities and the fracked gas used would be more than the combined total consumption of all the state's fracked-gas fueled power plants.

Washington is justly proud of their emissions goal and efforts to reach it, as expressed on both the governor's web site:

"The governor has: powered a new path to Washington's clean energy future by requesting and signing an unprecedented suite of clean energy legislation into law, ushering in aggressive timelines for decarbonizing Washington's economy and transforming the state's energy landscape."

and the Department of Ecology's:

"Washington is a national leader in cutting greenhouse gas emissions to prevent climate change. Gov. Jay Inslee and the Washington Legislature have adopted a variety

of regulations, programs, and initiatives designed to reduce greenhouse gas emissions. ... Ecology stands proud to protect, preserve, and enhance Washington's environment for current and future generations."

It appears that Kalama's emissions are as significant as any other pollution source in the state. Yet in examining the various versions of the SEIS I cannot even find a reference to the state's goals. Ecology must insist that the SEPA analysis comprehensively and honestly address the issue of how Kalama's total carbon emissions relate to the state's climate goals.

Whatever, NWIW promises vaguely to mitigate these emissions. There is no reason to trust NWIW's mitigation promises.

Your state's Shoreline Management Act, as shown on your website, says "The SMA establishes the concept of preferred shoreline uses. These uses are consistent with controlling pollution, preventing damage to the natural environment, or are unique to or dependent upon use of Washington's shorelines." Ecology must reject this boondoggle on the basis of unacceptable and unmitigatable carbon pollution.

BIGGER PLANS DRIVEN BY PROFIT

Because the Kalama proposal is but one of three, and because the fracked gas industry is desperate to export its surpluses, I suspect that NWIW has future plans that are as yet unstated in such documents as the SEIS, including plans for expanding Kalama to export liquified fracked gas (LNG). There is some evidence as well that the fracked gas volume required by Kalama will require a new transmission pipeline. In addition, the Trump Administration is allowing the shipment of LNG by rail. If such shipments occur, my state of Oregon is as threatened as the state of Washington.

Ecology must use its power to dig out all NWIW planning documents and emails showing future intent about anything beyond the refinery and a 3.1-mile feeder pipe, e.g., a new transmission pipeline and/or LNG export facility/expansion. We need the total picture of this corporation's intent to cut through the spin and promises.

EMISSION DISPLACEMENT

NWIW claims that part of its "mitigation" of carbon emissions is that their consumption of fracked gas will be more efficient than use of fracked gas elsewhere, and will displace the use of "dirtier" fuels in China (the SEIS says that the first "project objective" is "NWIW and the Port are pursuing the proposed project with the stated goal of reducing greenhouse gas (GHG) emissions globally by producing methanol from natural gas rather than coal"). These speculations about future energy decisions in foreign energy markets are so much hot air and Ecology must ignore them in their decision making.

JOBS AND TAX REVENUES

Ecology must ignore the jobs and local tax revenue claims made by NWIW. These are made-up numbers and not relevant to the department's responsibility to protect the state's air, water, and shorelines.

"PLASTICS MY BOY"

This advice may have had traction in 1967, but it advocates harm now. The idea that the Kalama

facility exports are intended to help produce plastics in China is to propose a crime against nature. Plastics in all forms are polluting every system on earth. It is time to stop this madness and send NWIW packing.

Marian Wineman

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Rhett Gambol

Hilary Benson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. As a mother of two children, I insist that the future health of our planet be of utmost concern to those in the position to make choices for Washingtonians. Please consider the health and wellbeing of our residents today and in the years to come.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Hilary Benson

Elsie Lamb

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

I'm not re-writing / adding to this petition -- it speaks well for itself and for me. I am another citizen/household that remains deeply concerned about fossil fuel production, including its critical role in exacerbating climate change -- the single greatest threat to the planet. I've had personal experience with oil/gas wells and their operations, and know too well the damage that comes from them on many fronts. I have also worked for a major international oil company in the legal department, and I know of the games that are played before, during, and after development of a project.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Jane Walker

As we watch the effects of a changing climate impact us directly in the Pacific Northwest, as a State and an individual, we should all feel obligated to mitigate for this. And one of the ways is to not allow for production of a product like methanol, a known contributor both in itself and, indirectly through fracking. I hope that my comment against the building of the Kalama Methanol Manufacturing and Export facility will help us meet our goal of limiting the effects this facility will have on exacerbating climate change.

Carl Thor

Please deny the permits for building a massive gas-to-methanol plant at the Port of Kalama, WA. As a life-long recycler, I was chagrined to read recently of how the fossil fuel industry misled (read "lied to") the world in promoting the idea that plastics are recyclable when, in fact, they knew full well that most plastics recycling would never be economically viable.

(<https://www.npr.org/2020/09/11/897692090/how-big-oil-misled-the-public-into-believing-plastic-would-be-recycled>)

Now, thanks to this decades long deception, the world is choking in plastic waste and our oceans are irretrievably polluted with plastics. It's the same old story of corporate industry fabricating "truth" to suit their own purposes and promote their own profits as long as possible, without regard to public and planetary health.

Why, then, should we be expected to believe what the fossil fuel industry says in promoting the Kalama methanol plant? Most of the exported methanol would be used to manufacture more plastics. And the facility would be responsible for generating large amounts of greenhouse gases (CO₂ and leaked methane). These two facts alone are reason enough to prevent the project from going forward.

Thank you for your time.

Emerson Pirot

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Emma Klein

Marcia Pearson

You must not allow this enterprise to be initiated. The disastrous effects are clear: dangerous pollution, draining of precious aquifers, the largest facility for fracking, the destructive consequences on health and safety for land, water, environment, and all human life, but also the precedent you would be setting, opening up possibilities of similar facilities as this. There is no choice you should be making but to protect the resources that are in danger. I am appalled that you are seriously considering it. It's clear to everyone that approval of this proven hazard could only be done for the short-term benefit of making money, with the empty rhetoric of providing jobs. We are not fooled by this. Hard as it may be for you, your duty, our duty as citizens who must live and breathe and care for what you are ready to throw away, our precious environment, our future as a world, it is your duty to not make the mistakes that will cost us all in the future. Do the right thing, deny this facility from being built. Please. If you stand up tall now, when will you?

Linda Orgel

I heard that the Grays Harbor Audubon comment letter did not upload so I am trying again.

In Re: Kalama Manufacturing and Marine Export Draft Second Supplemental EIS

Dear Director Doenges,

The Grays Harbor Audubon Society is opposed to the NWIW methanol refinery proposed to be built on the Columbia River. At a time when we must reduce carbon pollution and the impacts of climate change, considered a major threat to our security, introducing the proposed refinery would cause millions of tons of greenhouse gas pollution. This level of pollution is inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C. The fact that this is a permanent installation being constructed means that methanol will continue to be exported to (probably) China for many decades to come, a strong source of greenhouse gases out of control of any U.S. regulations.

The SEIS argues that methanol could "displace" dirtier energy when in actuality it will add to the amount of dirtier energy. Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year. Combustion of the full methanol production capacity of the plant would generate 5 million tons of pollution each year.

Over 62 bird species comprising thousands of birds were identified in the area of the Columbia River near the proposed refinery by Washington Audubon members in September 2019. Birds are seriously affected by everything, from changes in the timing of their food (insects) items to massive die-offs from huge regional fires during migration. Greenhouse gases causing global warming is upsetting many of the intricate timing regimes of natural systems, including flowering, insect emergence, wildlife food sources, migration and others not yet recognized. Life as we know it depends on lowering greenhouse gases, not allowing them to persist well into the future.

In addition, the proposed facility would negatively impact public health and negatively.

1. Fracking pollutes water systems and causes physical harm from earthquakes and the devastation of surrounding habitat.
2. The pipeline required to transport fracked gas has a high-risk potential for leakage and spills, releasing harmful chemicals into ground and surface water.
3. On-site operation of the facility would pollute the Columbia River and its tributaries with harmful runoff and contribute to reduced air quality leading to increase instance of asthma and other respiratory illness.
4. Methanol emits a wide range of hazardous air pollutants including ammonia, carbon monoxide, nitrogen dioxide.
5. Methanol is highly flammable and extremely toxic if ingested or inhaled.
6. Spills into large natural bodies of water, such as rivers and oceans, cannot be contained.
7. Increase in tanker traffic would harm endangered salmon and increase risk of ship strikes that harm or kill whales near the mouth of the Columbia River.
8. Pipelines will need to be built to supply the refinery, endangering communities along the route.

9. Accumulations of methanol vapors in confined spaces may explode if ignited, and containers filled with methanol may rupture violently if exposed to fire or excessive heat for a prolonged duration.
10. The proposed plant would be built on soil with moderate to high risk of liquefaction in a known earthquake zone.

Washington cannot contribute to the goal of keeping global warming “well below 2 degrees Celsius” by allowing major polluters to move forward. A low-carbon future demands investment in lower-emitting production processes. Ecology should not assume that future energy needs must be met by fossil fuels. All fossil fuel pathways would be massive polluters. None of them will solve our climate crisis.

Ecology also fails to consider whether cleaner energy technologies may dramatically displace the need to use methanol for transportation fuels. Industry studies show that more investment in fossil fuel industries yield much less job growth than greener energies. There is a greater job return in moving to a green economy. All of these high-carbon paths are unacceptable and inconsistent with Washington’s clean energy and climate goals, and will not bring the jobs promised.

Thank you for your careful consideration of these concerns. The risk is too great.

Janet Strong, President
Grays Harbor Audubon Society
on behalf of the
Board of Directors:
Jude Armstrong
Cecilia Boulais
Arnie Martin
Robin Moore
Mary O’Neil
Linda Orgel

Steven Wright

The proposed Kalama methanol plant presents a clear danger to life. Methane escapement from the well heads, transmission lines, and proposed plant should not be ignored. Green house gasses from the plant will negatively effect our environment and will imperil my life, sons, and grandchildren. This methanol plant proposal would be a toxic polluter and it should never be started.

Lynn Carpenter

I oppose the construction of the Kalama Manufacturing and Marine Export Facility. The consensus on the world's scientists is that stabilization of the earth's climate requires reduction of greenhouse gas emission to net zero in less than a decade. All members of the global community must take unprecedented action to limit global greenhouse gas emissions beginning immediately. Building a new mega facility that will contribute enormous amounts of greenhouse gases to the atmosphere will further destabilize our climate.

John Walling

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Chris Covert-Bowlds

As a family doctor and father, I know our health must be protected. The more I learn about this project, the more it becomes clear that it is not worth the health risks. It seems much more based on making money at the expense of health risks. Profits over people, once again. With the climate crisis becoming ever more obvious, we must transition off fossil fuels as quickly as possible, and this project just supports fossil fuel use. Please put people over profits this time; stop this project.

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. Rebecca S

I am vehemently opposed to the Northwest Innovation Works, LLC project at the Port of Kalama! It is an assault on people's health and safety in the pursuit of corporate fossil fuel profits. Bad for the environment/bad for people living along the Columbia river and surrounds. No more fracking! We need clean energy now!

Bernice Simpson

Stefanie Weaver

The air quality in Kalama during the summer is so bad already that I cannot imagine any responsible governmental entity voting to making it worse. It's almost like the folks who support this don't live in Kalama.

While I don't want to diminish the importance of family wage job creation in Kalama, we might as well resurrect the nuclear reactor if we are going to invest in high externality energy. The external health care costs due to air pollution (and potentially now increased water pollution) as well as hazard and emergency clean-up are borne by the taxpayers of Kalama and Cowlitz County rather than the private companies who would bring this kind of operation to Kalama. As an energy source, this technology is already almost dead and Kalama and Cowlitz County taxpayers would inevitably have to pay the costs of decommissioning the facility when the investors declare themselves suddenly insolvent after they clean out their company accounts. It's only a matter of time.

Paula Rusterholz

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Priscilla Wright

I am strongly opposed to the approval of the Kalama methanol plant for many reasons. The consequences of building this facility are far-reaching. To believe that greenhouse gasses would be reduced worldwide in the long run because of the export of methanol to China is ridiculous. The amount of methane that the facility would require for years is enormous. We are concerned about the future of our climate, our children's and grandchildren's health, our beautiful Columbia River, and the way of life we hold dear.

Edward Belcher

Fracking the gas, leaking it for transport, then producing methanol which is then shipped overseas to be used to make plastic is dirty, unhealthy and harmful at every step of the process. Permits for this project must be denied.

Allan Wise

Many times big picture comments are ignored in favor of detailed analysis. The proposed methanol facility takes away from quality of life in our community. This is important.

There is no way and I mean NO WAY that the facility as designed and used will reduce carbon gases on our planet. If we are to believe the Chinese government, and make no mistake this project is the Chinese government, will act in Kalama's best interest is a fantasy. The resources of air and water should not be for the taking by foreign interests.

The quality of my air will be lessened by this project. I live about 3 or 4 miles downriver of the site on a hill. I expect pollution at my home. There is a finite amount of water resource in our area. The project will use a tremendous amount of this water. This is not acceptable.

I want my state, its ecology dept, , and my community to be on the right side of planet preservation. I strongly appose this project.

Karin Engstrom

I moved to Washington State in 1993 from my home in Southern California. I was a founding member of the Forest Preservation Society concerned with Land Management Planning on Forest Service lands. My involvement included researching environmental documents, setting up or attending and documenting meetings at locations of proposed studies, photographing and monitoring those locations over time, writing administrative appeals, and putting together a monthly newsletter for the membership.

I raised my family in a foothill community of the Angeles National Forest (now burning at a rapid rate) and organized restoration projects after fires. My family built and restored hiking trails and spent many weekends backpacking in those mountains with a Boy Scout Troop.

Once my six children graduated from high school, I moved into the mountains to run a campground for three years, where we took families on hikes and other outdoor activities, teaching the history and ecology of the area. After that, I was fortunate to live in the Sheep Mountain Wilderness on homesteaded land for three years.

These experiences gave me great insight to what global change really was. I saw changes on a day to day basis. I lived with nature close up. I saw the consequences of my presence there.

Upon moving to Seattle, I continued my interest with Land Management Planning, Washington history and the incredible Hanford project. I completed a Masters in Whole Systems Design centering around the relationships of my high school, its environment and community. I taught a student run Outdoor Education class, bringing students into different parts of Washington for outdoor experiences.

Whole Systems Design is basically a study of the consequences of our actions. Here are my reasons why this Methanol plant should not be built.

1. There is no such thing as mitigation with global change.
2. After last week's air quality from the fires along the West Coast (I thought it looked like nuclear winter), why would the state take the chance that any type of "accident" from this plant or the ships and trains that transport this stuff would not permanently damage the proposed location?
3. The extraction of so many gallons of water for production causes an imbalance in the ecology of the area.
4. The water in the river is not clean. Hanford has been leaking nuclear waste from the beginning. They did studies that showed this. Now, tanks are leaking and nuclear waste is brought up the river to be deposited in Hanford's landfill from Bremerton. They store medical nuclear waste. It will always be a Superfund site.
5. The EPA website shows 69 Superfund sites in the state of Washington. Do we need the potential for another?
6. The Chinese want this plant, but they are transferring many of their energy sources to wind and solar to divest themselves from the fossil fuels they must import. What guarantee is there that this plant and its cleanup won't be abandoned?
7. Why aren't the Chinese building this plant in China, bringing the fracked gas directly from Canada? My assumption is they do not want the environmental consequences on their land and

water.

8. We have enough plastic that the Chinese propose to manufacture from this methanol. It is raining down on us – killing animals, including us, that ingest minute particles with our drinking water.

9. Our Governor ran to be the Climate Change Presidential Candidate. This is counter to his statements during the Primary. How in the world could he approve this project?

This Pandemic has given us the opportunity to stand back and really look at what we are doing to this planet. When we were all housebound, the air was cleaner, the noise pollution was down so that we could actually hear the birds, and my vegetable plants grew and produced more than I could possibly use.

At some point in time, the Department of Ecology and our state government, including its Governor, must do what we did in the Pandemic. We must stop. These projects add to the many forms of pollution that create Super Fund Sites. This is your opportunity to act in behalf of our environment and all living things.

Jo Boswell

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

12-12-18

To: Environmental Review Board for the Kalama Methanol Plant

Subject: This plant will cause an increase in CO2 emissions and increase climate change.

Request: Turn this project down.

According to their own environmental impact statement this methanol plant will emit 2.9 million tons of CO2 per year, making it the largest stationary source of climate pollution in our state except for Centralia's TransAlta Power Plant which will shut down in 2025.

The International Panel Environment Climate Change, IPECC, has issued a warning that we have "only 12 years to lower world CO2 emissions before climate change is irreversible." Climate change has already caused increased wild fires, severe storms, flooding and drought, costing U.S. taxpayers billions of dollars annually. As our climate warms these catastrophes will only get worse. To contain warming to 1.5 degrees Celsius or (2.7 degrees Fahrenheit), manmade CO2 emissions would need be reduced to about 45% by 2030, from 2010 levels and reach net zero by 2050." This will be difficult to do, but we must do it starting right here in our state by giving a resounding "No" to the proposed Methanol plant in Kalama. Future generations are counting on us to listen to the climate scientists and reduce our CO2 emissions. Instead of building more fossil fuel plants such as this, we must, lead the way toward becoming the 1st state to rely on 100% green energy as quickly as possible. After all, we are the Evergreen state. Let's live up to our name.

Virginia Nugent

However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Mary Guenther

I am just writing to support the work done on this draft and in opposition to the Kalama Manufacturing Export Facility. I don't have the technical credentials to comment other than to encourage your work and voice my deep appreciation for your attempts to stop it.

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. My name is Virginia Nugent

2600 NE 142nd St. Vancouver WA 98686

I am an 82-year-old grandmother. I have 2 children and 5 grandchildren and I have grave concerns about climate change and the effect it will have on their future.

Ecology's analysis states the Kalama methanol plant will produce millions of tons of carbon pollution each year, for 40 years. You have heard testimony from many citizens why this project must be denied. I'm going to cut to the chase and talk about the most important and urgent reason this project must be denied and that is Climate Change. It is disheartening that once again the public has to fight against another fossil fuel project in our beautiful Evergreen state. This is nonsense and has to stop. Governor Inslee has a good energy policy, but we must take it a step further. We must adopt a ban on all future fossil projects. Scientists have told us that we have only 10 years to take aggressive action to prevent climate change from spiraling out of control. If we don't stop pouring CO₂ into our atmosphere, we will be creating an apocalyptic future for our children and grandchildren and eventually threaten the very survival of human life on this planet. This alone is reason enough to deny this project. Future generations are counting on you to do the right thing.

Virginia Nugent

Graden Quist

Please do not build the Kalama methanol facility, not in Washington and not anywhere. It is critical that we keep our skies cleaner without burning a CO₂ gas emission. This is so we can help to preserve all life on Earth and benefit future generations of all living things without the harmful emissions that create a global warming or temperature anomaly effect. Thank you from me and all those future generations that will benefit from not building this site.

Renee Grant

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Wendi Ross

I am a longtime rural resident of Kalama and I am opposed to the proposed methanol plant. There is so little Columbia riverbank left here. Kalama has worked hard to secure anchors for our growing tourism base here in our quaint town. This will not add to our town, only distract from it. The ruining of our beautiful environment to let China into our lives and country should never happen.
Please don't let this happen!

Susan Gottfried

Karen Reid

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

John Wood

Comments on the Polluting Kalama Methanol Refinery
9-16-2020

Ladies and Gentlemen:

I stand with all the speakers whose goal is to convince you to deny the Shorelines Permit for the Kalama Methanol Refinery. In addition to their tribal, economic, environmental, legal, spiritual, resource, and endangered species reasoning is plain old common sense. Taken as a single incident, this methanol plant presents a profound affront to the welfare of all people. When considered in the context of the history of hydrocarbon combustion pollution and the resulting calamity of the accelerating climate crisis, it would be shake-my-head stupid to approve it.

So nowadays we all know that the scientific community is united in its understanding that fracking, the combustion of fracked gas itself, the combustion of the methanol, and other products made from it are contributing to global climate change, rapid rising of sea level, melting of the polar ice caps and mountain glaciers, huge firestorms, super-sized weather events, plastics pollution, and so on. Taken together, these may constitute the largest existential threat ever faced by humanity worldwide.

And we all know that adopting renewable power sources like solar, wind, hydro, and conservation, and increasing our efforts to increase their scale globally might help avert some of the intensity of the worst things that are knocking at our doors right now.

We also understand that all the newly revised arguments for building the plant (as opposed to the disproven falsifications used in the first application for the permit) are based on economic projections and scenarios that do not place the enormous costs listed above on the balance sheet! Who actually has a line item saying "dollar cost of global pollution and climate change"? Anyone can make a "cogent" and "convincing" case for anything they like as long as they do not have to account for the costs, and in this case the costs are too great, too many, too bear, and they ought to be convincing in their own right, but here are all these volunteers fighting off an aggressive investment consortium when it means to make another penny.

To do our jobs as good citizens who desire a better future we must implore you to resist the seduction of whatever the other side promises and simply follow common sense (and science) and deny the permit to build another fracked gas to methanol plant. Especially here where 48 states are downwind of the plume of pollution. Other speakers will give you the legal rationale you will need to deny the permit.

Thanks for your time. Please be well and do no harm.

John Wood
Hood River

Let's see if I have this right. Applicant says to Washington State that plastic demand is so strong that if they don't build this 40 year project with fracked gas here in Kalama then China will build one using coal. At the same time applicant sends out written prospectus type information to potential investors telling them that applicant is not going to produce plastic from the methanol; it's not profitable enough.

They're instead going to produce fuel.

Applicant next says its crystal ball shows a 40 year sustained demand for its fracked gas plastic at a time when there is as we speak a crush of world opinion and capital moving to produce plastic and plastic substitutes from sustainable resources and not fossil fuels. And applicant claims global emissions would actually be reduced if they're granted this shoreline permit saving the world from a coal fired methanol plant in China.

Instead of comparing only the two worst case possible outcomes, fracked gas emissions or coal emissions, how about considering better options over the next 40 years? I mean isn't that your mission statement: "Protect, preserve and enhance the environment for current and FUTURE (emphasis added) generations"? For the life of me I do not understand why you would put yourself into this assumption riddled box where applicant would gladly escort you.

You've basically got the worst greenhouse gas emitter on the planet, the totalitarian government of China, fooling no one as Northwest Innovations, trying to lock this community and the world into 40 years of outrageously high annual greenhouse gas emissions at a time when it can be deadly just to walk outside in Kalama and breathe the air because of climate impacts. And this is a company that has already straight faced lied to you about what they're gonna do if you grant them this permit. They're gonna burn it, not make plastic. And if they talk out of the other side of their mouth and say "oh yeah, we'll make plastic, just give us the damn permit", guess what? That plastic market is much less profitable than fuel and expert reports are already circulating that China will just incinerate any excess plastic not recycle it, putting even more greenhouse gas emissions into the air than currently calculated.

Northwest Innovations can not be trusted. Its word is worse than worthless, it's downright dangerous.

Pix Basso

Please do not allow a foreign company to invade our pristine Kalama and create an unhealthy environment for man, land, wildlife and air.

Ask yourself would you want your children or grandchildren live in an area where a catastrophic event could and most likely will occur at any given time. This is an earthquake zone. We have a major river system, a major interstate highway system that will all come to a stand still for months if this plant explodes. And for what risk? Money in the Chinese pockets because we have already given them tax breaker so the tax payers won't see anything. Stop the madness.

Karen Fedorov

Karlyn Gedrose

Our Grandchildren's Lives Matter

Governor Inslee's 100% CLEAN ENERGY FOR AMERICA Plan is the first major policy announcement in his Climate Mission agenda ♦ a bold 10-year mobilization to DEFEAT CLIMATE CHANGE. To allow the World's Largest Fracked-Gas-to-Methanol Refinery to be built in Kalama (or anywhere) defies Inslee's plan for America to be among the first global leaders to achieve net zero pollution by mid-century.

If built, the plant would use a massive amount of natural gas, more than all of the gas-fired power plants in Washington combined. This huge new demand for gas will lead to new gas well drilling and fracking, and new regional pipelines that lock in future fossil fuel use for DECADES. We don't have decades. It's a fact: Fossil fuels produce large quantities of carbon dioxide when burned. Carbon emissions trap heat in the atmosphere, which then leads to global warming. Many of the extreme weather events we are currently experiencing - like wildfires and hurricanes - will only become stronger and more frequent in a warmer world. With ♦ heat comes drought and more air pollution, both of which are particularly harmful to children.

Governor Inslee strongly agrees with the Intergovernmental Panel on Climate Change (IPCC): To avoid the worst impacts of climate change, the global community must cut climate pollution in half by 2030. Washington's legislature has set a target to reduce emissions at least 25% below 1990 levels by 2035, and the Department of Ecology has recommended a more ambitious target of 40% below 1990 levels by 2035.

Washington Department of Ecology's own website states "We're proud to protect, preserve, and enhance Washington's environment for current and future generations."

Department of Ecology, your decision impacts so much more than the community of Kalama! YOU have a responsibility to aid in the phasing out of fossil fuel reliance in favor of clean energy. Please support Governor Inslee's plan and SHUT DOWN NWIW's Chinese-backed methanol refinery NOW before it's too late. Your WRONG decision could enable the world to pass a disastrous turning point that cannot be undone.

Emily Wagnitz

As a lifelong citizen of Washington State, a mother, and a Christian, I strongly oppose the proposed fracked gas to methanol plant in Kalama, WA.

In this summer of unprecedented wildfire damage on the West Coast, and storm damage on the East Coast, the immediate reality of the Climate Crisis could not be more obvious.

And yet, even as industry and government have finally, belatedly, begun to publicly admit to the reality of climate change and massive environmental degradation, they continue to function as if old environmental policies and economic paradigms still made sense. Significantly expanding fossil fuel and plastics production anywhere in 2020 is not just short-sighted. It is insane.

Scientific data overwhelmingly and urgently informs us that the global community must begin a massive, immediate shift away from fossil fuels and plastics if our children and future generations are to have any hope of environmental, political, and economic stability.

In my 40 years of living in Washington State - largely on the west side - I have never in my life experienced anything approaching the horrendous air-quality that my family and I have endured during three of the five past summers at my family's home in Ferndale. As a child growing up in the 1980's and 90's my summers were spent almost entirely outdoors, enjoying the clean air and natural beauty of Washington. Days and even weeks of enforced sequestration indoors due to late summer wildfire smoke are part of life for my five-year old son. He has come to believe that this is a normal part of summer. Science suggests it likely will become just that.

I understand that this project will likely create some jobs, and will make a few lucky rich people even richer. I imagine that the folks who stand to gain the most from this project will have the means to jet off every August and September to some spot where the air is cleaner than it will be here. But they will have an increasingly hard time finding hospitable climates in the future, as sea-levels rise and heat-waves, floods, and storms increase in intensity.

Middle class Americans like my family will have to shelter in place and endure, as the planet, the foundation of our economy, begins to crumble under the weight of what we have built on it.

God help the global poor, who are increasingly subject to flooding and drought, and who will be displaced in ever-increasing numbers, and looking for shelter in the first world.

If this project does not go through, I will be sorry for work and wealth lost. But we cannot continue to do business as usual. Business as usual is literally killing us.

There are no jobs on a dead planet.

I pray that those of you with the power to make the final decision on this project will examine your consciences, find your courage, and do what is right here. Thank you.

Elizabeth Peck

Janet Kirkland

I am writing this comment as a practicing clinical psychologist. I oppose the Kalama methanol refinery and urge the Department of Ecology to reject the proposed project permit.

The organization, Psychologists for Social Responsibility, wrote a letter to the President of the United States urging an end to fracking given the risks it poses to human and environmental health. They also wrote to the US Congress urging climate action now to prevent severe mental health risks resulting from climate change, including increased anxiety, depression, and post traumatic stress. Heatwaves, air and water pollution, and loss of wildlife habitat create significant mental and emotional distress for people of all ages. In my clinical practice, I see the negative effects of climate change on the mental health of my patients. Our recent devastating wildfires, made much worse by climate change, negativity impacted the mental health of many local residents.

The Kalama refinery project would be a major polluter in the state of Washington and beyond. We are running out of time to take appropriate action to preserve a sustainable environment.

Greg Willett

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Joann Derie

To whom it may concern,

I strongly oppose the proposed Kalama Methanol Refinery. It may be that this refinery would release less pollution than others but that is not the point. This has to stop. We need to focus our businesses and resources on renewable energy. If we make a stand, others will follow, and we can work together to decrease pollution.

Washington State is making efforts to move to energy renewable resources. This plant would not do that. According to Ecology's draft study, it would cause 4.6 million tons of climate pollution for forty years.

Also consider the specific areas affected. The wells where the gas is fracked leak methane which is worse than carbon dioxide. The river traffic of all the added ships on the Columbia will affect the water quality and fish runs which are already endangered. Then there is the chance of an accident at the plant which would endanger all life - people, animals, and vegetation- in the area.

Our state, world and locale cannot afford this refinery. Please put support behind businesses that mitigate fossil fuel pollution in order to work toward a future for us all.

Thank you
Joann Derie

William Phipps

for the love of god/ess
we have got
to stop
all things gas related !!!!
methane is so toxic and so polluting and hangs around for so long...
the lag time of CO2 and methane is decades !!!
that means that what we have already put there will stay there in atmosphere for decades.
we have got to stop putting more ghgasses into atmosphere .
AND STOOP NOW !!!
No more fracked gas.
No more coal mining...NONE.
NO MORE OFFSHORE OIL MINING.
no LNG export facilities.
No more methanol plants.
shut down all coal plants NOW..
we are destroying our planet right in front of our eyes!!!
for the sake of future generations of all life on earth,
we must stop spewing GHG into atmosphere.
NOW...NO MORE...
total switch to renewable energy,
electric cars, busses, trucks.
battery storage.
micro grids,
solar and wind turbines on a MASSIVE SCALE ...NOW.
FOR THE LOVE OF GOD/ESS ...
NO METHANOL PLANT IN WASHINGTON!!!
NO METHANOL PLANT ANYWHERE!!!

Lawrence Johnson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. Janet Lenart

I am a Registered Nurse concerned with the public health. The proposed project would be harmful to public health. Fracking pollutes water systems. High rates of leakage and spills occur in the pipeline that transports fracked gas, resulting in harmful chemicals entering the groundwater. The facility would pollute the Columbia River. Despite best laid plans to prevent such problems, human error happens as we have seen in various similar projects.

In addition, the project is counter to the WA climate goals. It would produce 4.6 million tons of carbon pollution annually. Please deny the Shoreline permit for the refinery.

Janet Lenart

Debbie Rehn

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Dottie Villesvik

In reading the environmental impact statement I am opposed to the construction of the Kalama Manufacturing and Marine Export Facility. The consensus of the world's scientists is that stabilization of the earth's climate requires reduction of greenhouse gas emission to net zero in less than a decade. All members of the global community must take unprecedented action to limit global greenhouse gas emissions beginning immediately. Building a new mega facility that will contribute enormous amounts of greenhouse gases to the atmosphere will further destabilize our climate."

Kristen Klooster

Please keep our communities safe and keep Washington and Oregon on track to meet our goals for reducing climate pollution.

Courtney Brace

We are absolutely against the proposed methanol plant in Kalama. The benefit does not outweigh the (many) risks and the benefit of local jobs may be minimal at best.

Laura Johanson

No, no, a thousand times no. Backward thinking, major environmental and social affects at the fracking source, more ghg, more disproportionate affects on low-income people here, more plastic and more ghg at its destination. This is not in line with Washington values and exactly the wrong thing to be doing anywhere in the world, let alone here.

Don Steinke

I'm Don Steinke, retired physics teacher. We are being given false choices. Choose this project or choose whatever the market decides.

Our colleagues around the world will fight those other projects. They stopped 15 LNG export terminals in British Columbia, stopped the two pipelines on the east coast and twice defeated one in Coos Bay. They're counting on us to do our part and stop this one.

Our climate system cannot afford either one of the choices. We are close to the point at which global warming will not stop until temperatures have risen 5 degrees Celsius, which would be the end of civilization as we know it.

Toyota proposed the Prius in 1988, and it was a good idea at the time, but even a Prius factory built in Kalama today would not be compliant with policy in China. China told the automakers "go all-electric or go home".

China leads the world in wind, solar, and battery electric buses. They have 400,000 battery electric buses and we have about 400.

China signed the Paris Climate Accords. Even if all the speculation in the EIS actually happened, this project would not comply with that agreement.

You should not approve a project unless you know all the facts.

Don't guess at the methane leaks in the pipeline. Measure them. The home-base for the Pipeline Air-Plane is at the Pearson Airport in Vancouver. Attach methane sniffers to them.

Five days ago, Bloomberg reported that Gas companies are abandoning their wells, leaving them to leak methane forever.

Just one of them in California could have emitted 30 tons of methane and there are millions more like it. Include those facts in your EIS.

Dolores Kueffler

To whom it may concern:

I am extremely concerned about climate change and the way that the burning of fossil fuels is changing our environment. This summer's extreme weather conditions have been a dire warning. The plan to build this Kalama manufacturing and marine export facility is another example of us ignoring science. Methane increases global warming and methane leaks are a major problem of all these type of facilities.

I recently made the decision to close my fused glass business largely because of my ethical dilemma of how much fossil fuels it takes to make and design glass. It's one thing on a personal level that I have control over.

I believe this plant goes against the goals of Washington State to reduce greenhouse gases rather than adding to them.

I oppose the permitting of this plant because it will be a huge source of greenhouse gas emissions. The argument that those countries using this fuel would use dirtier sources doesn't hold water. We don't know what they'll do. What we do know is that this methanol plant, if built, will spew millions of tons of emissions a year. It would also have negative impacts upstream in extraction and transportation. It's a step in the wrong direction for our state and world in a time of global crisis.

Art Hanson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

I strongly urge you to keep communities safe and keep Washington on track to meet goals for reducing climate pollution.

However, you **MUST** do **MUCH** more. We **MUST** keep **ALL** climate-changing fossil fuels **IN THE**

GROUND! We MUST achieve 100% clean, renewable energy by 2030.

John Flynn

Department of Ecology

In 2008 the Washington State legislature established limits for reducing greenhouse gas emissions in Washington State. Those requirements can be found in Revised Code of Washington RCW 70.235.020. In its 2019 update Ecology recommended the following updated statewide reduction goals for GHG emissions:

- 1) By 2020, reduce overall emissions of greenhouse gases in the state to 1990 levels.
- 2) By 2035, reduce overall emissions of greenhouse gases in the state to 25 percent below 1990 levels.
- 3) By 2050, the state will do its part to reach global climate stabilization levels by reducing overall emissions to 50 percent below 1990 levels.

The Department of Ecology issued its "Washington State Greenhouse Gas Emissions Inventory:1990-2015 Report to the Legislature" in December 2018, Publication 18-02-043. The key findings of this report to the legislature were:

- 1) Washingtons 2015 total greenhouse gas emissions were 97.4 Million Metric Tons.
- 2) Washingtons 2015 total greenhouse gas emissions were 7.4 Million Metric Tons higher than the 1990 baseline of 90.0 Million Metric Tons.
- 3) Washingtons greenhouse gas emissions increased by about 6.1 percent from 2012 to 2015.

Today, Department of Ecology is considering whether to grant or deny a permit for the construction and operation of a fracked gas to methanol refinery in Kalama, WA, by a foreign owned company, that would add 4.6 Million Metric Tons of greenhouse gases per year to this matrix. We know that in 2015 we were 7.4 MMT over the 1990 baseline of 90MMT. By adding an additional 4.6 MMT that would equate to 12.0 MMT more than the 1990 baseline.

In order to meet the legislative mandate of reducing greenhouse gas emissions the Department of Ecology has no alternative but to deny the permits for this refinery.

Thank you.

JoAnne Baker

NO TO THE METHONOL PLANT IN KALAMA WASHINGTON!!!

Yes we need family wage jobs, but not at the expense of our environment. Our natural resources are being depleted to send methanol to China to make plastic. OUR WORLD IS DROWING IN PLASTIC AND WE DON'T NEED ANY MORE! We need to expend our interest in recycling the plastic we all ready have.

Kristin Edmark

Comment: Formal Comments on Kalama Manufacturing and Marine Export Facility Draft Second Supplemental Environmental Impact Statement, September 2020

RE: Upstream emissions from fracking

Date: September 19, 2020

Respectfully submitted by: Kristin Edmark, MPH RD

7611 NE 296th Way

Battle Ground, WA 98604 kristinedmark@hotmail.com; (360) 666-1285

To: Washington State Department of Ecology c/o Rich Doeges

Thank you for the opportunity to comment. Thank you for requiring the SEIS be redone. Thank you for the changes made.

Please add emissions from the fracking process to the upstream emissions. My main reason for being strongly opposed to the Kalama methanol refinery is that it encourages enormous fossil fuel extraction and fracking during a climate crisis. Thank you for including methane pipe leakage in your analysis. It is also necessary to include realistic emission figures dealing with the fracking/ extraction process itself. According to "High Country News" Colorado is facing large expenses attempting to cap "orphaned" wells. (<http://hcn.org> Jan 16, 2018 "Orphaned" oil and gas wells are on the rise) Large oil and gas companies usually sell their rights to smaller companies when wells become less profitable. Often these smaller companies walk away rather than attempting to cap wells as is required. Bloomberg has also reported on the growing problem of uncapped wells which continue to emit methane.

(<http://www.bloomberg.com/new/features/2020-09-17/abandoned-wells-are-left-to-spew-methane-for-eternity?>) The entire process of extraction including uncapped wells is a consequence of the Kalama methanol refinery creating a demand for the product.

As you know, the demand created by the methanol refinery will likely necessitate an additional north-south pipeline which will make it easier for additional large fossil fuel projects like that proposed at Port Westward, Oregon to be built.

Our world has run out of time to prevent enough change in our atmosphere to prevent continued climate disasters. The science is clear. I was struck by the globe exhibit at OMSI in Portland, OR showing world sources of greenhouse gasses. The exhibit points to northern USA/Canada as a major world emitter. It is just wrong and shameful for us to be doing this to the world. It is wrong for us to ignore/omit the upstream consequence of drilling/fracking created by the demand for gas by the Kalama methanol refinery.

Please include the full consequence of the drilling process including abandoned wells in the upstream emission. Please deny the shoreline substantial development and conditional use permit on the basis of unacceptable greenhouse gas emissions.

Mary Anne deVry

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. All major religions state that mankind is to take care of creation. In the Judeo-Christian-Muslim faiths the first responsibility given to humans is to take care of creation.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Mrs. Mary Anne deVry
6549 California Ave SW Apt 4 Seattle, WA 98136-1858

David DiGiandomenico

I would like to see this project progress and begin construction. It would allow for a safe reusable and sustainable energy source to be used to further our society. This project would also provide many jobs in the construction of the project.

Thank you for your time

Ethan Pfahl

I would like to see this project progress and begin construction. It would allow for a safe reusable and sustainable energy source to be used to further our society. This project would also provide many new jobs, for the maintenance and the construction.

Thank you for your time

Megan Richie

I oppose this facility and ask that their permits be denied. This is a risk our community cannot afford. The cost is too high. They would be using an obscene amount of natural gas to produce the plastics our world does not need at a cost our community cannot afford. Costs would go up locally for electricity and natural gas. In the event of a spill Our residential and wildlife habitat would be put at risk of being destroyed with little to no recovery. The costs are too high and I ask that this facility be denied.

ahnetta fields

I bought this house in February and I paid a lot of money for it because i wanted a view of the river.
If this passes I want the names of the people that passed it and the names of the owners because I
will sue for the devaluation of my property because it will block the view of the river that I paid for

Emily Moon

I strongly oppose Northwest Innovation Works' proposed Kalama methanol facility. As the draft SSEIS shows, the plant would be one of the most significant pollution generators in Washington. The Second EIS's additional analysis lends proof that the more this facility, its upstream/onsite/downstream emissions and the volatile world market/future condition are studied, the worse this project is deemed to be. All of the suggested world market benefits, mitigation means and their potential effects are speculative. This industry, the market, and environmental science are changing constantly, but one thing is certain: adding another source of pollution to Washington (a state that prides itself on its environmental values and stewardship) and only furthering demand for pollution-generating products is an unconscionable idea.

I urge the Department of Ecology to deny all permits for this project and to work tirelessly to safeguard our critically sensitive environment.

Thank you,
Emily Moon

Olivia Hill

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

jeff wilson

This is not a perfect project. There is no perfect project. The process to provide employment opportunities has been overshadowed by poor handling of the review process by Ecology. This process has contaminated future project inquiries due to the handling by Ecology. This project has complied with the requirements....approve this project.

Clint Bryson

I am writing to comment in favor of approving the needed permits for the proposed Northwest Innovation Works Kalama Methanol facility. This project provides an opportunity for tremendous investment in the area while being a part of addressing greenhouse gas emissions globally. I believe it's important that we recognize pollution of any type does not recognize borders. That's why building a project such as this in Washington State where we have strong environmental and safety requirements makes sense. The level of review has been outstanding and each time the result has shown that this project will have a net positive effect on global emissions. That is why I urge you to approve the needed permits that will allow this project to move forward and help Washington State to be a leader in using technology and innovation to improve the way industry functions. Thank you for the important work that you do for all of us.

Respectfully, Clint Bryson

Gunnar Leidel

I would just like to say that I lived in Centralia for four years and the lack of work that's there in the the amount of work that will come for passing of this facility being built will change lives and make things better there thank you

Kelly Lindmark

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Claire Butler

After enduring days of the worst air quality measurements in the world due to west coast wildfires, I cannot imagine a more ill-timed proposal for further deterioration of our shared air quality. Dept of Ecology needs to examine its priorities, at a time of particularly poor timing in the midst of a pandemic that compromises lung function. The trajectory has been increased compromise of air quality on the West Coast. Do not add to this health risk, please.

Megan Cover

Burning methanol as fuel would generate millions of tons of pollution each year. In 2018 and 2019, NWIW informed potential investors that methanol from the planned refinery could be burned as fuel overseas, in sharp contrast to claims NWIW made to local and state regulators that the methanol would only be used to manufacture plastic. Now, Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year. Combustion of the full methanol production capacity of the plant would generate 5 million tons of pollution each year. I am a teenager, and I do not want to be left living on an earth that is uninhabitable! WE NEED URGENT ACTION NOW. Please do not allow this to happen.

To Whom It May Concern,

My name is Mark Wells.

I'm a Business Agent for UA Local 26 Plumbers and Pipefitters of Western Washington.

I support the construction of the Methanol Plant mostly because of the large number of family wage jobs it will create, both during the construction phase and many more permanent jobs to operate and maintain the plant after it's built.

It will also generate much needed tax revenue.

Science has shown numerous times that this plant is a green project. Much greener than outsourcing this work to another country and ignoring the pollution because of the lack of regulations. Built in WA, it will meet all guidelines, create products we badly need in a much safer way without the pollution.

The permit for this project needs to be issued asap. Any other decision would be simply hypocritical.

Regards,

Mark Wells

carolyn atkinson

My name is Carolyn Atkinson and I work at an elementary school in Seattle. I am a young person who struggles with climate-related terror.

My students understand that they are growing up in a world in crisis. I prepared these comments under the smoke of the homes of Oregon's 500,000 American climate refugees.

My students are anxious. Can you imagine the despair and powerlessness of being 10 years old and knowing that we have only 10 years left to course correct? The most terrifying impacts of climate change are projected to hit us well within my lifetime. Before the end of the century, CO2 levels are likely to rise to the point of impairing human cognition. This concern is absent from the EIS.

The Kalama plant is justifying itself with the ridiculous logic that somehow, over the next 40 years, this plant will emit less than hypothetical other plants. This is an absurdity. 2020 shows that significant but long foreseeable economic, ecological, and human system collapses are here. The next 40 years will be so unpredictable that most of my generation has agreed that we won't bother to plan for retirement because of the scale of chaos on our horizon. The EIS is ridiculously optimistic. Assuming "Business as usual" indefinitely is absurdity.

The ecological and political instability that breaks the 40 year speculation of this environmental statement is caused by the climate crisis.

The instability is caused by fossil fuel expansion.

The instability is caused by projects EXACTLY like this one

It is exacerbated by the commitment to dishonesty of all fossil companies INCLUDING Northwest Innovations, which has wasted DOE time with "data" so optimistic and inaccurate that this whole environmental impact process had to be repeated. We don't want to work with careless firms when the stakes are this high. The EIS should accurately account for historical failures of this industry to clean up after itself and prevent leaks.

It is time for those with the responsibility to do the right thing to quit saying "well, just a little bit more". The planet doesn't have a little bit more to give!

Protect, preserve and enhance the environment for current and future generations. I am one of the children of the generation that you were supposed to fix this mess for. We are grown now, and we are angry that the mess is still here for us to clean up. Don't make it bigger. Reject the statement based on incomplete and dishonest data. It is not worth it for temporary construction jobs when there's so much other construction to FIX this mess that needs to be done.

RICHARD STERN

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Sydney Brahmavar

The idea that a methanol plant is being considered in the "progressive" state of Washington is abhorrent. At a time when we need to be forward thinking and stop destroying our planet with disastrous greenhouses gases, the environmental impacts of this decision clearly are not being considered. No new fossil fuel infrastructure in our state, stop destroying our state and planet by building fossil fuel infrastructure. As a state we need to reduce our emissions and LEAD in green tech and infrastructure, no invest in a dying industry that we know is destroying our planet and exacerbating the fires in our state.

Cynthia Jones

Good morning, and thank you for the opportunity to comment. I am calling on the Department of Ecology to reject the methanol refinery.

My name is Cynthia Jones. While I grew up in Colorado, I have lived in Edmonds, Washington for the last 30 years. I recently drove from Edmonds to visit family in Colorado, through smoke the entire way. I spent a week in Colorado in smoke, and returned home to another week in heavy smoke. Simultaneously hurricanes were battering the southeast. It is clear to me that climate change is real, it is now, and we must take rapid action to address it.

One of the main causes of climate change is the burning of fossil fuels. If we wish to address climate change, we cannot continue to burn fossil fuels, including methanol.

The proposed methanol refinery would create millions of tons of greenhouse gas pollution each year, and would lock us in to doing so for the next 40 years.

We cannot be distracted thinking mitigation will solve the problem. Nor can we believe that the only way to proceed is to continue to pollution-emitting plants. While we need to think globally, we need to act locally. I am not comfortable with increasing pollution in my state with the hope of decreasing pollution across the globe.

I treasure clean air and the opportunity to spend time in the great outdoors. I urge you to join me in working to protect our climate by facilitating the move away from fossil fuels. The Kalama Methanol plant will increase the burning of fossil fuels, increase the level of pollution in our state, and make it close to impossible to achieve Washington state climate goals. I urge the Department of Ecology to reject the methanol refinery.

Thank you.
Cynthia Jones

Rebekah Gaxiola

Director Watson and Department of Ecology,

Please reject the proposal to build and operate the gas-to-methanol refinery in Kalama. The negative ecological impacts of this refinery are far-reaching and it's irresponsible to move forward with this project. Please do the right thing for the community of Kalama and the other victims of this kind of development.

Joel Caldwell

My name is Joel Caldwell of Toledo washington. I am writing to ask Ecology to please deny the project. 6 months ago my wife and I had our first child. Now the entire west coast seems to be burning in relations to the amount of carbon we have put in the atmosphere. Now is the time to scale back emissions and switch to Renewable energy, not build the world's largest fracked gas-to-methanol refinery.

For future generations we must scale back emissions and halt climate change. please deny NWIW's refinery in Kalama!

Thank you,

Joel Caldwell

Lori Sarancik

I am a resident of Longview, WA, and I appreciate the opportunity to leave my comments on this project. First of all, I live inside the city limits of Longview, and, as such, would not be able to visually see the new facility. It would not impact my everyday travels whatsoever because I live and work in Longview. I suppose any particulate that is air-borne would have the possibility of impacting me without me being aware of it. Because I am not a scientist, nor have I seen a study of this phenomenon, I cannot comment on the health impacts of the air after this facility is in operation. I would be interested to see how the Longview/Kelso area would be impacted by this. Also, my home and property would likely not change in value were the facility built and operating. Having said these things, I cannot speak from the point of view of having this facility built in my very own field of vision. So, I think those opinions of folks living near the location of the facility should be considered and studied with great detail. My interest in building the facility is economic. I have a teenage son who is working toward entering a workforce, and I interact with a lot of his friends who are in this stage of life as well. I believe that the number of jobs to build the facility and the number of jobs that will be available once it is operational are a very important point. These positions would provide opportunities for our youth that is maturing, so they would not have to leave town to find jobs with a good wage. Also, I have heard that the facility is sponsoring Workforce training. This is so important in our area where so many of the kids live at the poverty level and may not have an opportunity to study in college post high school. The facility could be a game-changer for our youth living below the poverty level. I believe we have a high percentage of youth in both the Longview and Kelso School Districts who participate in the free lunch program. These statistics are available from DSHS. Along with the number of new job positions available to our youth, this workforce training program is a huge need that the facility would help fill in our community. Finally, I believe the tax revenues from the business operation could be a big benefit to building and repairing our county infrastructure, recreational facilities, and community programs. We should look carefully at these things. So, to conclude, I am, as a resident of Longview, looking at a lot of economic and workforce benefits from this facility and it is attractive. If we carefully study and consider the health and financial impacts of the residents of Kalama and those living near to the facility, and we find they will have every opportunity to be free from physical and financial harm, then I believe it is a good project. Again, thank you for the opportunity to comment.

Debra Lee Keim

I do not support extending a permit for the Kalama Manufacturing and Marine Export Facility. With all the extreme climate events we are experiencing now and predicted for our future, I find it devastatingly short sighted to proceed with this facility which will become one of the worse greenhouse gas emitters and consumer of fracked natural gas in our state. Department of Ecology do not issue this permit! This area of the Columbia Has plenty of sunshine and wind. We need to encourage renewable energy projects which will provide economic benefits and green jobs, not methanol producing greenhouse gas emitters.

Ruth Pettis

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Karlyn Gedrose

Five years ago, my husband, Greg and I purchased what we considered to be our "dream property" in Prescott, Oregon along the Columbia river. We were married on the beach in front of our home last summer.💎 You can see Steelscape and the proposed site of the methanol refinery in the background of our wedding pictures - that's how close we are!

Greg and I found out about the refinery plan a few years ago. We would NEVER have purchased here had we known. NOT ONCE have Prescott residents ever been directly contacted to let us know what's going on. Living just 1/2 mile, we are probably more vulnerable to health and safety risks than anyone in Kalama! There have never been any direct mailers or signs to let us know we are living in the blast zone. THIS SHOULD HAVE BEEN MANDATORY INFORMATION COMMUNICATED AT THE VERY BEGINNING STAGES. Consequently, we were denied the opportunity to engage in the initial public hearings and comment periods.

NW Innovation Works did not effectively communicate to residents when a similar plan was in place for the Port of Tacoma. When they learned about it, residents there pleaded their case and won - no methanol plant is being built there and it should not be built in Kalama either!

This is untested, "new" technology proposed by a company that has no experience building methanol plants! It would be bad enough to allow a knowledgeable company with many years of experience - at least they might have learned a few safety tips over the years...but to allow a brand new FOREIGN-BASED company to come in using us as guinea pigs? Really? How can you possibly even consider building this hazardous facility when so many lives are at risk? 💎💎💎💎💎💎💎💎💎💎

Methanol is HIGHLY TOXIC TO HUMANS AND ANIMALS. It is most dangerous when ingested but inhalation of high concentrations of vapor and absorption through the skin are just as bad for producing toxic effects. The risk for cancer and other illnesses to those of us living in Prescott will surely increase.

We understand the desire for more jobs brought into the local Kalama area, but for Prescott residents, we gain NOTHING. A recent study found property values decreased up to 11% after an industrial plant opened.💎 Another study indicates that air pollution has a significant negative loss on home prices within a 2 mile radius of a refinery. By law we now have to disclose our knowledge if we want to sell. Would you buy a home in the blast zone directly facing a dangerous, noisy, toxic, eyesore like this?

Prescott is home to young children and the elderly, the most vulnerable to health risks resulting from air pollution. Prescott Beach is a popular county park providing exceptional fishing, windsurfing and recreational opportunities. The methanol refinery with it's 245' flare stack, vapor plumes reaching 2 1/2 miles high, new dock for tankers and 72 million gallons of on-site methanol storage would degrade the quality of Prescott Beach. Prescott citizens do not support sacrificing the health, livability, and economic future of our community to a dangerous fossil fuel export project. We ask you to advocate for our community and do everything in your power to deny the permit.

Department of Ecology, how are you going to live with yourself if you approve this, knowing the potential risks, and then there is an earthquake or some other catastrophic accident? NW Innovation Works can implement all the safety precautions they want in constructing and running this monster, but they CANNOT PREVENT HUMAN ERROR, the cause of many refinery "accidents."

Gerard Hawkins, CEO of GBK Enterprises summarizes in his presentation entitled "Methanol Plant Experiences In The Last Twenty Years" states: "If it can go wrong, it will... Apparent safe systems can fail."

Please reject the permit for building the world's largest methanol plant in our front yard.

Thank you.

Corey Gedrose

I hope we can all agree we desire to live and raise our families in a safe, healthy environment. Our family home in Prescott is one of the closest to the proposed refinery, just 1/2 mile directly across the river. We will no longer feel safe in our home if it is built. NWIW is a new start up - they've never built or run a methanol plant. Their proposed technology has never been used. We are their guinea pigs in a risky, dangerous experiment they want to build literally on shaky ground, sandy dredged spoils, in spite of our close proximity to the Cascadia fault line, due for a potentially catastrophic earthquake at any time. The DEIS explains that soil at the plant site has a "moderate to high liquefaction susceptibility" which basically means the ground under the plant could drop up to 2 feet.

As if earthquake, fire and mass shooting lock down drills aren't enough to frighten our children, we will now have to introduce chemical plant explosion drills into our homes and schools. Can you imagine the ear-piercing tsunami-like blaring warning sirens and having to quickly shelter in place after donning air masks and sealing all the doors and windows after an accident releases toxic, flammable chemicals into the air? According to an independent analysis conducted by the Northwest Citizen Science Initiative, the entire downtown and all 3 Kalama schools are within the glass-shattering "blast zone". I don't know if our home would still be standing after such an explosion.

It is unbelievable to me that people in positions of local leadership and authority think this methanol plant is a good thing. We all should have the right to breathe clean, healthy air and feel safe in our community. We cannot let the quality of our life and environment be determined by those who care more about profits than the people in their very own neighborhood. Please protect our health and safety and say no to the world's largest methanol refinery in our backyard.

George Vaughan

Having kept myself informed by reading updates and the latest Dept. of Ecology report, my opinion continues to oppose the building of the Kalama Methanol Plant. My main objections are: 1. it is counter-productive to our efforts at reducing Greenhouse Gases; 2. it will require the building of infrastructure that combines with #1.; 3. the greater part of employment is short-term; 4. it has the potential to be hazardous to the Kalama and Columbia River environment; 5. any mitigation proposed by the company is nebulous; 6. basing any decrease in future Greenhouse Gases on the actions of a foreign country is wishful thinking; 7. do we really want to increase the world-wide production of plastics? In my mind, those points would seriously object to this project being completed.

Sharon Kalister

Re: Kalama Manufacturing and Marine Export Facility Second Supplemental EIS.

Climate change is real and it's here now ... showing the impacts in the PNW with unprecedented 60 mph winds this month that spread wildfires across areas that have not historically been impacted. I've lived in this area since 1964 and have never seen anything like it. The Arctic is melting and we are seeing more numerous and stronger hurricanes in the SE US. The idea that we would even be considering allowing new fossil fuel infrastructure is the epitome of stupidity, ignorance, and denial. "No" is the correct and only response to this project.

Jim Byrne

I do not want a methanol plant anywhere in the Pacific Northwest. Last week SW Washington suffered the worst air quality in the world and tropical storms ravaged the south east. Some claim climate change is a hoax, but I believe it is real; and the forest fires and hurricanes are manifestations of climate change.

I have been a WDFW fish biologist for 28 years and have monitored climate change locally. It is accelerating annually, with this summer being a clear (or smokey) indicator that the time for action has ended. It is time for action. Methane gas is 20 times more dangerous for the climate than CO2. This project is fraught with methane gas leak potential, from the initial fracking process in Canada, through the transit process to Kalama. It is not even a WA or US company that benefits, but a Chinese company whose previous positions are contradictory.

This is not good for the Pacific northwest. Do not permit this plant. Thank you.

Jim Byrne

Deborah Kramer

I am against the Kalama Methanol Plant. Keep dirty emissions and fuel out of our beautiful state. Global warming is a serious threat. Protect Washington state and future generations from this dirty project. Thank you.

Greg Hoffman

"We are facing a man made disaster of global scale, our greatest threat in thousands of year: climate change," said David Attenborough at the UN Climate Change Summit. "If we don't take action, the collapse of our civilizations and the extinction of much of the natural world is on the horizon. Leaders of the World, you must lead. The continuation of civilizations and the natural world upon which we depend is in your hands. Time is running out."

WHAT OTHER APOCALYPTIC WARNING DO WE NEED TO HEAR? COULD THERE BE A MORE PERILOUS MESSAGE?

The proposed methanol refinery in Kalama would pollute as much as 1.2 million cars and use millions of gallons of water from the Columbia River each day, polluting the air with cancer causing toxins.

Department of Ecology and other local decision-makers, YOU MUST BE LEADERS IN OUR FIGHT AGAINST CLIMATE CHANGE. Like it or not, the continuation of civilizations and the natural world upon which we depend is partially in your hands.

This is not a dress rehearsal. Wield your influence and be the North West climate change champions we need you to be and put an end to the methanol refinery NOW!

Jean Avery

The Kalama refinery would have a huge environmental "footprint"-- if that term can be used to refer to pipelines and ocean routes.

-- The map on page 41 shows pipeline routes that would supply fracked gas to Kalama: 600 miles from British Columbia, plus 800 miles from Wyoming -- totaling 1400 miles of pipeline. Even if NWIW mitigated for upstream emission leakage, would this be sufficient to mitigate for other damages -- such as to lands occupied by Indigenous tribes or private landowners?

-- On page 48 is a color map of the world, with a red line showing the marine route from Kalama to China. As proposed, large tankers would transit 5,000 nautical miles from Kalama to China. Product would be unloaded, and the tankers would return empty to Kalama. This 10,000-mile round trip would be completed approximately once a week. (The SSEIS estimates 36 to 72 shipments per year; see page C-4).

Although the SSEIS includes plans to mitigate emissions within Washington, it is less clear

- (a) if there will be any mitigation outside of the state and
- (b) if there will be mitigation for non-emissions, such as marine fuel.

In conclusion:

- 1, The enormous reach of this project -- across the continent and across the globe -- would be hugely impactful, even beyond the stated GHG emissions.
2. The SSEIS fails to provide a complete, multi-dimensional plan for mitigation.
3. The scope of this project seems far beyond the regulatory purview of one state's Dept. of Ecology.

The Climate Clock is ticking. Please deny this project.

(Presented as oral testimony on Tuesday morning, 9/22/2020, with this revision: Neil's slide confirms zero mitigation out of state.)

Dave Hale

My comment on the KMMEF DSSEIS:

Washington State Department of Ecology, Olympia, WA,

Thank you for the opportunity to comment on this important decision making process.

My name is Dave Hale. I live in Silver Creek, WA and I'm a retired biologist. In my career I have primarily worked on wildlife and fisheries habitat. A portion of that work was involved in research on salmon smolt downstream passage through the Bonneville Project dams on the Columbia and the lower Snake River dams.

I would like to address the issue of our GHGs in the state of Washington and the contribution that the Kalama methanol refinery would have on those emissions.

Having reviewed the DSSEIS it is clear that Ecology has done a fairly good job of analyzing the life cycle of contributions of the project and also of the current alternative processes. I realize the difficulty of attempting to determine by projection, from sources of information with varying and sometimes conflicting data, the contributions of GHGs resulting from the development, extraction and transport of natural gas. This is also very difficult when analyzing the downstream use contributions, especially in a foreign county where we have sometimes questionable information and no control over how the product of this project will be used.

It is clear that the argument, used by NWIW, of displacement of more carbon intense processes over in China is highly speculative and dependent on a number of factors that rely on social, economic and developmental uncertainties. Looking at the results of the DSSEIS in this area, it's clear to me that the displacement theory would be OK if it actually resulted in offsetting dirtier forms of plastic and/or fuel production and use. Sadly, the analysis seems to rely on increasing use of fossil fuels and lacks the comparison of alternative methods of energy production (renewables). I believe that Ecology has, as part of the analysis, the need to compare and contrast the results when a greater proportion of the transport and electric energy may come from solar, wind and other low carbon power generation. China is rapidly developing electric car technology and has been using a greater portion of their solar panel production in country. I realize that renewable power production increases are also in the realm of speculation as well. Therefore, I will consider that KMMEF methanol could, under higher oil prices and greater restrictions on coal processes in Asia, displace some dirtier methanol processes like naphtha and coal. That's speculative; China is investing in new coal power plants and not just within China.

That leaves us with the Kalama NWIW site which will potentially produce, on average, approximately 1M T CO₂e GHGs per year for 40 years, locally, and 5M T CO₂e GHGs, for 40 years, globally. That represents a net increase in carbon produced in state (and globally) as a result of a proposed business. This doesn't fit with our current goals to reduce our carbon footprint or to protect our air and water. Further, mitigation is questionable with no definite plans to localize carbon sequestering or prevent additive effects of air pollution of the lower Columbia River airshed. With consideration of the additional risks to our important Columbia River ecosystem, human health impacts that can't be mitigated, and use of resources (natural gas, water, and electricity from a grid that relies on fossil fuels for make-up power when hydro is insufficient), Washington State can expect to bear the brunt of the negatives of this project with little benefits. My work in natural resource conservation was aimed at repair, enhancement and protection; not posing new risks.

Please deny the Shorelines Permit for KMMEF.

Thank you,

Dave Hale, Silver Creek, WA98585

Dennis C

The absurd notion that this refinery would actually reduce global GHG emissions hinges on the highly speculative prediction that it would displace less clean burning methanol production facilities and assumes that the methanol market will continue to expand indefinitely. It also fails to consider that renewable energy sources might displace fossil fuel sources. I urge you to please deny this permit.

Jimmy Peterson

I would like to see this project begin construction. It would allow for a new source safe reusable and sustainable energy source to be used to further our society. This project would open a large number of jobs in the construction of the project.

Thank you for your time

Mariana Sanchez

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Nichole Snyder

The Kalama Manufacturing plant would be a climate disaster. After our state just spent a week and a half being covered in wildfire smoke that left our air unhealthy to breathe are we really considering opening a plant that is meant to convert natural gas to methanol for the sake of creating more plastic? The average human is consuming 5 ounces of plastic A WEEK. This is the equivalent of a debit card. Are we seriously sticking to creating toxic plastic to further destroy our planet and bodies? As the climate crisis is accelerating at a rate even scientists can't believe are we really creating a plant that enables us to create more plastic? How much longer are we going to prioritize immediate profit over life? On top of that the proper studies haven't even been done to see what damage this plant will do in terms of emissions and local impact. It should not be ignored the emissions that will be created after the methanol created in the plant is shipped to Asia to use in creation of plastic. On top of everything else this plant is set to be built right on our own Columbia river. We have all seen that corporations would rather pay a fine after a disaster rather than preventing disasters because they are never held responsible. Will we further danger our wildlife and food environments? This methanol plant would create a higher risk of earthquakes in our region. Are we willing to put lives in danger for profit? We should be moving AWAY from fossil fuels. Not accelerating the climate disaster even more. This facility would pose a great danger to our local area and the planet. This planned facility should be stopped at all costs. Stop this nonsense. Stop killing animals and people for the sake of immediate profits. Will you be able to look your children in the eyes and tell them you did everything you could to give them their peers a safe environment to thrive in?

Brenda Michaels

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Timothy Baer

Hello,

I appreciate the opportunity to share my thoughts and position on this issue, even while I despair of the efficacy of the action.

Please deny this application for construction. I love my life in rural King County, WA. I believe that most of us want to see our planet continue to support thriving humanity, and that we can see the inherent contradiction with building this facility.

When we base our decisions on what the other guy (China) might do, we're on shaky ground. Clean up your own backyard, and then ask the neighbors if they will join you. Do not pretend that you are waiting for the other guy to act first, or that it's hopeless because he never will.

While humans may have an inherent bias toward negative stories, we can choose to tell each other positive stories, and work toward the reality we long for. After all, we are the ones creating all of this, together. Which side will you support? One argument seems to favor the status quo, the other is more visionary. One is powerless; the other works toward a better future.

I've heard that there are three types of falsehood: fibs, lies and (the most egregious) statistics. By your own admission the current studies are (at best) very speculative. You can just as easily create a study opposing as supporting this plant. Add upstream and downstream emissions, for example. There are many other factors to consider.

Fundamentally, the current conclusions are clearly based on untrue assumptions. e.g.: "We cannot quickly change the way we've always done things in the past." Really? Is that your experience of the worldwide response to the current pandemic? We actually CAN make wide, sweeping changes. Worldwide. We CAN stop using so much plastics and methanol, for example.

What's missing is willpower. And leadership. WA Department of Ecology can do better; can live up to its mandate. Please show the type of leadership that the overwhelming majority of humans around the world are pleading for their leaders to take. Do it for humanity (if the non-human world doesn't figure into the equation.)

It troubles me to see the disenfranchised being used as pawns in a media war waged on all of us (By the fossil-fuel industry!) to support this abomination of a plan. The plight of families who have lost their livelihood is not lost on me. Change is inevitable, though, and narrow self-interest will not serve the self in the long run.

Deny the permit!

Thank you,

--Tim Baer

My name is Meccah Boynton-Brown. I am a resident of southwest Washington, and I have very big concerns about the impacts and health consequences on the people and land in Kalama, the surrounding cities and counties, the state, our waterways, and the air with the proposed methanol refinery and any future dirty energy corporations. It is not a secret that energy companies mislead the public. They are responsible for the inevitable damage and destruction to our precious land and they disregard the cost and detriment to humanity.

About ten years ago, my husband was on the Deepwater Horizon oil rig when it exploded into the Gulf of Mexico. I want to believe that everyone in this country knows about this tragic environmental and ecological disaster, but surprisingly they do not. As a reminder, it was an industrial disaster that began on April 20, 2010, and considered to be the largest marine oil spill in the history of the petroleum industry. It leaked for almost 90 days and is still believed to be leaching oil from the fractured surface on the ocean floor today. The fishing and tourism industry was devastated, 11 men lost their lives that day, several have life-long injuries, including my husband who is still suffering from the “**accident**” today. I say accident with quotation marks because it was preventable. BP, Transocean, and Haliburton were responsible for their gross negligence and willful misconduct. Nobody was charged for the deaths of those on board that night, and the companies involved may have had to pay fines and restitutions, but they don’t heal the damage that was created. They continue to profit in the billions, despite their record for irresponsibility.

Almost 2 years ago, my parents lost their home and every treasured possession in the Paradise, California fires due to the admitted negligence of PG&E. 85 people died in that fire, over 11,000 residential properties were burned, and in total, about 19,000 structures were lost, devastating a community and creating a toxic environmental problem for several generations. A cancer-causing chemical, benzene, has tainted the town's water, leaving it undrinkable. My understanding is that only a couple dozen homes have been rebuilt, and the residents still have to transport clean, bottled water to their homes. I was in Paradise a few months ago, and there are still churches and road-side stations to pick up water. The local water company declares that there are areas that you can utilize the water, but they are apologetic that the water doesn’t have their “normal fresh flavor” and they know there is a “musty odor”. They dodge responsibility by adding a statement...The following water system information is prepared and updated by PID and is subject to revision. PID does not guarantee the accuracy of this information nor its fitness for a particular use. Would you drink the water? How many are now relocated, homeless, and facing health issues? PG&E filed for voluntary bankruptcy protection in anticipation for the impact of billions of dollars in liability claims for one of California's deadliest wildfires. PG&E now has more than \$50 billion in liabilities, and we know that will not make the people and the land whole again. This too, was preventable.

For years I have sat in on legal hearings, government meetings, even going to Washington D.C. to watch my husband testify to the Senate about the problems with the energy industries and the impact. It doesn’t take a genius to know that greed is the prominent factor. Fossil fuel companies will spew deceptive narratives, including promises to ensure responsible emissions and economic contributions that they really can’t calculate. They promise jobs, which decline year to year, and tax revenues that are usually far from accurate. There are daily implications of pollution and damage, but I am also concerned for the large-scale, preventable incidents of human miscalculations that permanently scar our lungs and landscape. I, like many that are speaking in reference to the proposal in Kalama, could speak for hours and debate the facts and impacts. We have legitimate concerns and heart-felt interests that do not line our pockets.

The energy created by outdated technologies of oil, gas, and coal industries need to be eliminated. The proposed methanol refinery in Kalama, or anywhere in the Pacific Northwest is unwelcome. We need renewable resources that will sustain our future and the generations to come. I am asking the Department of Ecology to **deny** the Kalama Manufacturing and Marine Export Facility.

Patricia Auer

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

anna waendelin

I submit my opposition to the Kalama Methanol Refinery. We in the West are keenly aware of the effects of global warming and we do not need another 12 million tons of carbon pollution, as this refinery is projected to emit. What is needed is to promote and support green and sustainable energy and...fast!

Alice Shapiro

There are many reasons to oppose the Kalama methanol plant. You know that methanol is a potent greenhouse gas. We are in the midst of a climate crisis and extreme drought in Washington as well as Oregon, where I live, as do my two young granddaughters. We have recently experienced hazardous air quality due to the smoke of numerous, monstrous wildfires, some of which are still burning. These fires were driven by a combination of dryness of the forests, presence of "kindling" from smaller, replanted trees (large, old growth trees are not as susceptible to burning) and high wind conditions. The drought and ignitable forests are exacerbated by the practices of improper forest management and logging as well as an increase in greenhouse gases from the use of fossil fuels. I am a retired community college biology and ecology professor and I understand from a scientific level the catastrophic dangers we face (and have already faced) from the continued use of fossil fuel. This plant is extremely ill-advised and will magnify the health crises we are experiencing. From a personal level, I am a grandmother and great-grandmother who wants a viable future for my family and for all people and other species with whom we share this planet. Two of my granddaughters live in Portland, as I do, and suffered greatly from the dense smoke and fear of fire, both physically and emotionally. I am including a picture of each of my Portland grandkids to personalize what is at stake. There are countless other children who are at stake. Consider the future and the health of our planet. We don't have many chances left to tip the scales to unstoppable planetary disaster. My grandchildren want to have a happy, healthy childhood as they and all children deserve.

My name is Catherine Spofford. I live in Portland Oregon and have two young granddaughters whose future I am concerned about. The proposed methanol refinery would be the largest fracked gas to methanol refinery in the world and would impact not only the community of Kalama but all the Northwest. We have just seen some of the worst forest fires in the history of both Washington and Oregon. Scientist agree that climate change, resulting in higher temperatures, changes in precipitation patterns and cycles of drought across the west, contributed to these disastrous fires. The proposed refinery would become a significant source of greenhouse emissions each year, further contributing to the climate crisis and undermining Washington's greenhouse gas reduction goals. The refinery would consume more gas than any sector of Washington's economy necessitating a new fracked gas pipeline that may go down the entire length of the state. As we know gas pipelines leak methanol, which is 80 times more polluting than CO₂, and have a history of dangerous explosions. This pipeline would go through communities, farmlands and forests and would increase the risk of pollution, explosion, and fire. I want a future where my granddaughters and other children are not afraid of losing their homes to fires and not forced to stay indoors because the air is too unhealthy to breath. This project will only exacerbate the climate crisis. I urge the Washington Department of Ecology to protect our environment and the future of our children and grandchildren and reject the methanol refinery and deny the Shoreline permit.

Kristyn MacPhail

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

David Berger

Thanks for you opportunity to comment. Please deny the shorelines permit for the Kalama manufacturing and export facility. The environmental consequences of increased green house gases, potential fracking impacts, possible increased plastic production, and and localized toxic air pollution are dire.

I live in the gorge, and recently saw a train cause a fire on the Oregon train tracks. These likely fires coupled with highly volatile trains containing fracked gas are terrifying.

In addition, I have seen large amounts of micro-plastics on what used to be pristine ocean beaches. The potential for this facility to cause an increase of toxic plastic in the food chain is another reason to deny this permit.

Thanks again for the chance to comment.

David Berger

Jef Gunn

I am from the region. My father and his family grew up on Mount Saint Helens near Spirit Lake, and later in Kelso and Longview. I was born in Seattle, and now live in Portland. I travel through Kalama frequently. We are blue collar working stock. My dad's dad was a welder. My maternal granddad was a miner in Northern Manitoba and British Columbia. I've been a carpenter all my life. I get it that the project would bring jobs to the area. I understand that important need.

However, there's more going on here in this project than jobs. There is also the need to protect home, to take care of home for our communities all across the geography of this proposed project. The conditions we enjoy on this planet—temperate atmosphere, oxygen, water, vegetation, animals—are not common. This planet is unique and rare! This Great Northwest region is uniquely special. Not just because it's home, but because it's beautiful and abundant. I am a carpenter, not a scientist, so I'm not going to pretend fluency with the technical data. I see as well as you do the staggering projected atmospheric and aquatic pollution that is bound to happen as a result of a project of this scale dealing with fracked gas and methanol. I say it's bound to happen because I'm a carpenter. Whatever is built will eventually fail. Period. These projects fail all the time. Catastrophically. And the SSEIS has already called out multiple issues that have not been adequately addressed.

It will not fail only in Kalama, but along the fracked gas pipeline, all the way back its source in Canada. I have a stake in this there, too as my mother's family are in BC and Alberta. And it will fail all along the shipping route to China and into cars there or plastics there. Even without failure, massive pollution will follow the trail. Enough is enough.

I know, and you know too, that fossil fuels have, in just two centuries, created wealth for some, ease of life for many through many important inventions, and at the same time destroyed life on this planet. Death and deadly weather are part of the legacy of fossil fuels. They simply go hand in hand. That's not going away unless we change course now. NOW.

The world has been hearing the warnings since the early 50s, for my whole lifespan. We have to learn. There are new technologies already in existence to lead us into a clean sustainable future. These new technologies also will create jobs. Let's put our efforts and money into these new sustainable technologies that will usher in a new era of clean prosperity for all. Lots of work making the way for a dependable future.

Jef Gunn

Shannon Milhaupt

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jesse Chapman

Washington DOE should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama.

NWIW misled your agency, and the public, about the purpose and impacts of this refinery. I am counting on Ecology to dismiss NWIW's misleading claims for reduction in emissions and accurately account for the project's upstream and downstream pollution. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change. The devastating fires still burning throughout the west highlight how critical it is to actively reduce our fossil fuel production and use.

The risk to the people and climate of Washington is simply too great. Please keep Washington on track to meet our goals for reducing climate pollution. I am counting on you to do the right thing and stop this unnecessary fossil fuel export project.

Sincerely,
Jesse Chapman

Tess Roberts

If you call yourselves an innovations company, then try doing something innovative, creative, or new. plastic from petroleum is so yesterday. Fucking do something better with your money and resources. Something that you will be able to proudly tell your kids about in 50 years. Build the world's largest compostable plastic plant, the world's first carbon sinking plastic plant, the world's only algae based plastic plant. Something cool that this country will be proud of, and the world will look up to. Y'all are morons if you don't take your billions of dollars and do something that is so outdated. It's fucking 2020.

Thi Doan

I am 100% opposed to this Kalama Manufacturing and Marine Export Facility due to the massive negative impact on the climate, and not to mention the local environmental damage and pollution.

Anonymous Anonymous

My name is Vikki and I am a new resident of Kalama and Cowlitz county. I am asking the Department of Ecology to reject this project.

I am greatly disheartened to see that state and county officials clearly have no interest in protecting the residents of this county, nor in providing safe, long-term jobs in innovative and growing industries.

NW Innovation Works is a dubious company that is primarily backed by the Chinese Government and, according to documents obtained by OPB, has been telling different stories to different interest groups. While it has been telling Washington officials that this plant would mainly produce plastics, it has been telling Chinese investors that it will play a large role in feeding China's insatiable fuel appetite. Company stakeholders are lying to U.S. officials and fully intend to use this plant primarily for burning fuel, making this environmental assessment invalid.

Another issue is that the current pipelines that transport methane gas from Whatcom County lack the capacity to supply the plant. This means that an entirely new pipeline would need to be built along the length of I5, requiring the use of Eminent Domain to remove citizens from their homes and significantly increasing the risk of methane leaks. According to a study done by the Environmental Defense Fund, a methane leak rate of even 3% would result in significant climactic damage. There are no reliable studies that show that any methanol company has been successful in limiting these leaks and even the current DEQ study has estimated a leakage rate of at least 3% or about 9 million cubic feet of methane per day.

Furthermore, this project is a dud and will not lead to long-term job growth or stimulus. Countless economists and studies have shown that there is a glut of fossil fuels on the market and so many of them are struggling to be profitable that they must rely on tax-payer subsidies. NW Innovation is no different and has already applied for a \$2 Billion loan guarantee from the U.S. Department of Energy. By the time this plant comes online, it will be losing money, leaving U.S. Taxpayers with the bill. Fracking and gas is on its way out, we should not be part of a dying and destructive industry.

Finally, Methanol is a highly toxic, flammable, and volatile compound. It is not only capable of causing an explosion that would destroy the town of Kalama, but loose Methanol can also cause toxic gas vapor clouds that can travel with the wind. Causing nausea, vomiting, ocular injury, and muscle spasms. As massive wildfires become more common in this state, do we really want to add methanol fuel to the fire?

Neil Smith

I am a climate analyst and risk management expert for the DoD. This is not a valid environmental assessment and focuses our resources on furthering greenhouse gas investment rather than the development of renewable energy sources and ecologically sound production. A plastic factory, a methanol processing plant, etc cannot be justified by offset and or efficiency.

Dorethea Simone

I am a Retired Registered Nurse and a Grandmother and am writing this on this First day of Autumn, the strangest Fall in years. We have signs and symptoms of Climate Changes on display all across the USA from fires to floods and record breaking temperatures. Remember that earlier studies from Ecology did not include impacts from Greenhouse Gases on our environment. Remember that the polluters have a record of taking the money and then leaving clean up to tax payers. We can not trust polluters to police themselves or to even be truthful. I will give a few quotes from the Action Proposal from the American Nurses Association from 2012 because the Resolution they passed was ignored and now we have a big mess. Part of this proposal stated: "Collaborate with others for a national Moratorium on new permits for unconventional oil and natural gas extraction (Fracking) throughout the country until human and ecological safety can be ensured and "Collaborating with others on energy policies that incentivize energy conservation and the development and use of safer, healthier alternative and renewable energy sources such as wind and solar." The Nurses recommendations are 4 pages long and I can send a copy to you if desired. Methanol is poison so we do not need more of it in our environment.

David Radtke

My name is David Radtke. I am a union member of IBEW local 48. I am a journeyman electrician, rural resident and have lived in the greater Portland area my whole life. We work on many solar, wind and hydro projects in Washington and Oregon. I understand the need for renewable energy and a greener future. This project will help reduce the global greenhouse gas emissions. North West Innovation Works will implement Zero Liquid Discharge technology to protect the Columbia River, which we all care a great deal about. This facility will meet or exceed requirements for clean operation in the state of Washington. It will create 1000 family wage construction jobs during construction, 200 full time jobs, 500 indirect local jobs, much needed tax revenue and do so in an environmentally responsible way. It is time to move forward with this project and I am hopeful that it will be a model for future construction in America.

Thank you.

Markus Boos

My name is Markus Boos, and I am a pediatrician and scientist in Washington. I appreciate the opportunity to address the Department of Ecology and provide my thoughts on Northwest Innovation Works' proposed fracked gas-to-methanol refinery.

Simply put, I cannot speak strongly enough AGAINST the building of this refinery, and implore Washington state to deny the permit for its construction. Based on the Department of Ecology's analyses, this project would produce millions of tons of carbon pollution yearly. Not only does this run contrary to our state's climate goals, but the facility will also pollute water systems including the Columbia River, while devastating surrounding ecosystems.

As a physician, I would like to address the health effects that would result from construction of this refinery. What the Environmental Impact Statement does not directly address are the indirect costs that will occur secondary to this refinery's adverse effects on human health locally.

In 2018, the Intergovernmental Panel on Climate Change released a detailed report summarizing the devastating effects of human-driven climate change secondary to the combustion of fossil fuels and the release of greenhouse gases. These consequences include both economic and health impacts from natural disasters, sea level rise and the effects of extreme heat on changing ecosystems that will be unable to support human life. To mitigate these catastrophic impacts, the IPCC demands that we reach and sustain net zero greenhouse gas emissions as quickly as possible. Fundamentally, the permitting and building of this refinery runs contrary to that goal and no amount of greenwashed messaging about "carbon emission savings" associated with this project can contradict this fact.

We are experiencing the health effects of unabated greenhouse gas release today, and these will only worsen exponentially with time. Deaths from heat stroke, natural disasters including hurricanes, floods and wildfires, and heat-sensitive infections such as *Vibrio* are already increasing in our backyards, and worldwide. As a pediatrician, I also recognize the local, longitudinal health effects of pollution and climate change secondary to greenhouse gas emissions from refineries such as the one in question, which include a greater incidence and severity of atopic dermatitis, asthma and other respiratory illnesses secondary to polluted air (which is compounded by climate change-driven mega wildfires that we are currently experiencing).

I also witness first hand the persistent, detrimental mental health effects on those who experience natural disasters or scarcity as a result of these emissions and subsequent climate change. We know that, unfortunately, all of these consequences disproportionately affect children and the elderly, leading to a worsened quality of life and increased healthcare costs over an individual's lifetime. These enormous costs will ultimately fall on our woefully unprepared healthcare system and they MUST be considered in any impact assessment.

I implore the state to deny the permit for the construction of Northwest Innovation Works' proposed fracked gas-to-methanol refinery. Our health, our lives and our children's future depend on making decisions that transition us away from fossil fuels and towards a renewable energy future.

Thank you.

Caleb Warden

Having spent my whole life here in the PNW, I know just how valuable our beautiful lands are. From the mountains, to the deserts, to the oceans, to the forests, we certainly have an abundance of natural beauty worth fighting to the death to protect from outside threats. In a time when petroleum product consumption is on the decline in favor of more environmentally-friendly means of power and manufacturing, opening a new fracking plant on the gorgeous Pacific Coast is simply an unwise investment. It doesn't take an expert to see that plastic waste is a big problem for the environment in the form of litter and microplastics in our water, soil, food, and even our bodies. Clearly building more plastic infrastructure is not what we need; we're already producing so much plastic that we can't control it all. Then you compound the problem of plastic waste with fracking, a process that not only perpetuates the system of environmental damage by providing fuel for combustion engines and pumping our ground full of toxic chemicals, but also has been shown to increase the risk of earthquake. In an area overdue for a very devastating earthquake, this seems like a rather irresponsible decision. Further, what is the plant's plan to ensure there are no spills in the event of a severe earthquake? Heck, even when there aren't any earthquakes, spills are common in the petroleum industry. Can NIW promise the people of the PNW and anyone who comes to enjoy our lovely beaches that there will be no spills? All considered, this could spell an irreversible environmental disaster that only pays out for a decade or two at most. What reasonable person could consider that an acceptable compromise or a wise investment?

Ruth Kendall

My name is Ruth Kendall. I am a member of the Longview City Council. I think that the NWIW is an important opportunity that will provide a much needed economic boost to our community.

I am also a retired chemical engineer. I had the good fortune to spend my career working in an industrial facility in Longview. As a process engineer I was proud to contribute toward modernizing our process to make it more efficient, cleaner, safer, and more environmentally friendly. I had a first hand view on how advancing technology made this possible. NWIW's proposed state of the art project will be an important investment in the future of our community.

I am also very concerned about our environment. We live in a beautiful area that we need to protect. I am glad to live in the state of Washington that has stringent environmental laws designed to ensure we do this. NWIW has demonstrated its commitment to meeting and exceeding these expectations.

I feel strongly that the NWIW project would be good for our community. It will provide much needed jobs. The project will continue a tradition of industry for area while protecting our environment. I urge you to allow this facility to be built.

Sarah Blake

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Meredith Long

I am writing to the Department of Ecology to ask that you deny the permit for the Kalama Manufacturing and Marine Export facility to be sited in Kalama, WA.

This facility, like others which refine methanol, will require large amounts of energy to operate. Some estimates are that almost one third of the natural gas that would arrive for refining would be necessary just to operate the plant. Burning that much natural gas just to run the plant would contribute to global warming significantly. Additionally, the plant would use vast amounts of water, some 2,500 gallons per minute. Partly due to wetter winters with less snow pack, we already have a hotter and drier climate in the Pacific Northwest than has been true in the past. We don't need a plant that uses our valuable water resources. The plant would produce volatile organic compounds, heavy metals and other air pollutants. Our air needs to be cleaner, not dirtier, so that all of us, especially those with lung and breathing problems, can breathe better.

The Chinese can say anything they want about mitigation but their plans are so vague that there will be no way for our government to verify that they are not meeting their obligations to mitigate the pollution this refinery will bring.

The fires this year should wake up anyone who does not believe climate change is already happening. We cannot afford the continuous use of fossil fuels that this plant would use to be the source of power and manufacturing for plastics.

I want my grandchildren and great grandchildren to have a clean environment. I strongly urge you to deny this project for good!

Thank you.

Beth Levin

I oppose the refinery. The factory will kill jobs in tourism and agriculture because it will increase pollution which increases climate change. Climate change and global warming cause pandemics and increased wildfires here on the west coast. Burning methane will increase CO2 emissions.

Liam Doucet

My name is Liam Doucet, I am 18 years old and here on behalf of myself & my family who live in the city Portland, Oregon. That said I do hold a volunteer position at Historic Pearson Air Field in the city of Vancouver Washington.

I am here because I strongly oppose the plan to build a Methanol Refinery next to the Columbia River, and on top of the land Indigenous Nations call home & rightfully so. The threat that the facility will pose to the Northwest & its people is catastrophic. A vibrant ecosystem of animals & people both along the Columbia & even way up North as far as the Salish Sea, rely on the Columbia river to bring Salmon which is now at risk of extinction because of the Lower Snake River Dams. A Methanol Refinery built will end up sealing a deadly fate for all the Salmon either before or when a leak happens. And yes I do mean WHEN not IF. Looking at the history of Methanol plants (and frankly all chemical plants in this country) negligence & abuse seems to be a common factor when a disaster happens. Unfortunately not every single worker at this facility will be competent enough to make sure all systems work properly. If I learned anything from what happened 36 years ago in the city Bhopal India it's that failing safety systems is a classic blunder that happens with almost all American owned refineries. At least 16,000 civilians were claimed dead the night an American chemical refinery operated by American workers released toxic vapor into the skies of India when it's neglected failsafe broke. The people of the nations native to Kalama would be the very first ones to be hit by any spill or vapor release, which will severely injure & kill thousands of them, and eventually even kill or seriously injure a large American population only 30 minutes from the proposed refinery. Which my family and I are part of. And despite the country I was born in supporting the finest military in the world, I doubt they are willing to hand out any kind of modern treatment or protective gear to those who would be affected. To whoever is responsible for the creation of this refinery there is no doubt that you won't do provide for people affect. You decided to build the largest refinery on the Earth next to these people, and didn't even ask them. Which says a lot about how you don't recognize them as a people, let alone actual Nations with beautiful ways of life that have to be preserved.

The suggestion that I can offer to you is to look at how much the study is missing key scientific information which shows how much of a danger to the environment that the refinery will pose. Including the energy required just to keep the refinery in operation & the emissions that will release. Especially the emissions released gas fracking. No new jobs will come out of the refinery instead positions will open to already existing employees. Any new jobs that will be created will last for only two years per hired group of employees. This refinery is not "progress" toward a better America, if anything it is slowing progress to the America we need. A clean, non wasteful, & non destructive America that doesn't rely on harmful plastics & dangerous fuels, and respects the land it was built on.

Thank you for listening to my testimony, and I hope you decide against building this refinery on this beautiful land belonging to wonderful human beings. To those approving this refinery I encourage you to take account of every single emission released, contamination of land, & disaster that will be related to the refinery whether direct or indirect. You'd be surprised how much crucial information has been left out of this study. Attempting to replace chemical refineries in the People's Republic of China with other chemical refineries here in the United States of America does not solve climate

change, it only increase & changes the source of it.

Emily Wing

I STRONGLY oppose the development of a natural gas-to-menthol production plant. Our planet is on the very brink of environmental collapse, as we have felt keenly these past few weeks in Seattle. It is long past time to move on from harmful and polluting energies and invest in the future of green energy. The climate crisis will not only decimate our economy, our national security, but our very lives. It is no longer a "children's and grandchildren's" problem. It is all of our problem. Right now. No plant, do the right thing, for all of us.

Daniel Gassenberg

My name is Dan Gassenberg. I live in Richland Wa. I am a 25 year member of the Boilermakers union local 242.

I am 100 percent in support of the proposed Methanol project in Kalama Wa. The construction of this project will provide many good paying jobs for the hard working men and women who help build America. We have been looking forward to getting to work in Kalama. The economic situation in Wa state needs a rebound due to the Covid-19 pandemic of 2020. Unemployment is at an all time high. People need good jobs.

I ask the Department of Ecology to approve this permit. Thank you.

Julie Goebel

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Nick Engelfried

Dear Washington Department of Ecology,

After attending today's webinar on the Kalama methanol facility, I believe the logic used in the EIS to calculate the global lifecycle carbon footprint of this project to be fundamentally flawed. We cannot assume that building this plant will automatically cause China or some other country to build one fewer methanol plant of their own. Furthermore, the assumption that the volume of methanol this plant would produce will necessarily be made elsewhere if the project is not built also does not pass scrutiny. The assumption seems to be that the world will consume the same amount of methanol, regardless of how many different countries are dumping their product on the international market over the next few decades. This defies reason and basic economics.

I urge you to consider why it is that Chinese companies would buy imported methanol from the U.S. in the first place? Clearly, they would only do so if it is a cheaper option than purchasing methanol made closer to home. If U.S.-imported methanol is unavailable, using the product will become more expensive and less attractive, changing the economic calculus of whether it makes for companies to engage in activity that emits greenhouse gases. A product that is readily available on the international market is much more likely to be consumed than one which few countries are producing, and this applies to methanol. By adding to the number of new facilities dumping methanol on the market, we can expect Washington will contribute to more global methanol consumption and increased carbon emissions.

Furthermore, I question whether it is at all possible to calculate how the Kalama methanol facility will impact the decisions of governments and major corporations decades from now, during a time when the world is undergoing a transition to clean energy. Energy markets are changing so fast that assumptions made today may not hold true five years from now, let alone ten, thirty, or forty years into the future. Major oil companies like Shell and BP are planning for a post-oil future. Entire nations, including Asian countries like South Korea, are undertaking efforts to transform their economies in order to move beyond fossil fuels. It is certainly possible, and arguably likely, that China's economy will undergo a similar transformation sometime in the next few decades as renewable energy becomes cheaper and the costs from burning fossil fuels become ever clearer. Just recently, the Chinese government indicated it is considering significantly increasing its renewable energy targets for the next five years.

As countries are hit by more and more extreme weather events and other "natural" disasters linked to climate change, it can be expected that they will ramp up investments in green technology to a degree that would seem unimaginable today. Given the likelihood of this scenario, we cannot assume the demand for methanol produced at the Kalama facility will exist ten years from now or that it will be met by another project if this facility is not built. More likely, the plant will become a stranded asset making a product for a market that no longer exists.

What does seem convincing in the EIS are the numbers showing that here in Washington, carbon emissions will go up if the Kalama facility is built. While we cannot say with any degree of certainty how our actions will or will not affect market players in China, we can reduce our own carbon emissions and set a positive example for the rest of the world. In calculating the carbon

footprint of the Kalama project, I urge DOE to focus on this reality rather than making speculative assumptions that "prove" producing more fossil fuels will somehow result in fewer carbon emissions.

Thank you for considering this comment,

Nick Engelfried

jason Leonard

Hello,

I am a Woodland WA resident. I work for a construction contractor in the pipefitting industry and have done so for 25 yrs. I have to weigh the pros and cons of building such a plant on the Columbia River. Pros- Possible short term employment for myself during the construction. A few long term jobs for locals. A huge amount of revenue for corporations and a foriegn country. Cons- Environmental hazards to the surrounding river, air, and to our climate. I think I'll strongly opt for the second. It's time to stand up against climate change deniers and greedy executives. Is money REALLY more important than life as we know it? Think about it.

Kristine Plisga

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Gail Haubrich

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Claire Richards

My name is Claire Richards and I live in Spokane Washington. I am a nurse scientist, a professor of nursing, and a member of Washington Physician's for Social Responsibility. I'm also a mother of a four-year-old. My son was born in Seattle and we always imagined that he would grow up in the Pacific Northwest and that we would make this our home. But my son has only known one summer that was free of wildfire smoke. This last year in Spokane, the smoke reached unprecedented levels of hazardous air quality. We did not go outside for a week. Even with three high quality filters indoors, we could still smell smoke inside. Even staying inside, I felt so crummy that I worried that I was sick with COVID-19. Many people don't even have filters at all or were forced to work outside and this is a major issue of equity. Many other low and middle incomes in the world are unfairly suffering even worse impacts than we are. What kind of world did I bring my son into in which we need to live in a bunker for him to be safe? Why don't the lives of children all over the world matter, too? The recurrent wildfire smoke has caused me significant anxiety, restlessness, and despair about the future. All I can conclude is that children and those who love them are simply expendable to our state's institutions and leaders, if they can only continue to extract and process fossil fuels—what is causing the world to become unlivable.

The Lancet Countdown concluded that "The life of every child born today will be profoundly affected by climate change with populations around the world increasingly facing extremes of weather, food and water insecurity, changing patterns of infectious disease, and a less certain future. Without accelerated intervention, this new era will come to define the health of people at every stage of their lives."

When we look at what science says about climate impacts, we know that wildfires will increase on the west coast as a result of climate change and the burning of fossil fuels. What is mindboggling to think is to think is that the PNW is considered a climate oasis, even though with continued greenhouse emissions these wildfires are only just the tip of the melting iceberg.

It is a fairy tale to describe a staggering increase in greenhouse gas emissions as a decrease in emissions or a flattening of the curve only because it is being compared to a steep and unrelenting curve of emissions. We cannot allow massive new fracked gas projects to move forward based on speculation about markets abroad or even the promise that the product will be used to produce plastic. The company should have determined mitigation now and should be mitigating all impacts of the Kalama facility, not just those in Washington state. In the future, this is very likely to become an abandoned asset- at which point who is going to be responsible for paying to clean it up? I'm guessing the next generation. It's dreadfully misleading to suggest that this would help our economy. There is tremendous opportunity from green energy instead.

I'm calling on the Department of Ecology to reject the methanol refinery, and to deny the Shorelines Permit for the project.

The 2019 report of The *Lancet* Countdown on health and climate change: ensuring that the health of a child born today is not defined by a changing climate

Executive Summary

The *Lancet* Countdown is an international, multi-disciplinary collaboration, dedicated to monitoring the evolving health profile of climate change, and providing an independent assessment of the delivery of commitments made by governments worldwide under the Paris Agreement.

The 2019 report presents an annual update of 41 indicators across five key domains: climate change impacts, exposures, and vulnerability; adaptation, planning, and resilience for health; mitigation actions and health co-benefits; economics and finance; and public and political engagement. The report represents the findings and consensus of 35 leading academic institutions and UN agencies from every continent. Each year, the methods and data that underpin the *Lancet* Countdown's indicators are further developed and improved, with updates described at each stage of this report. The collaboration draws on the world-class expertise of climate scientists; ecologists; mathematicians; engineers; energy, food, and transport experts; economists; social and political scientists; public health professionals; and doctors, to generate the quality and diversity of data required.

The science of climate change describes a range of possible futures, which are largely dependent on the degree of action or inaction in the face of a warming world. The policies implemented will have far-reaching effects in determining these eventualities, with the indicators tracked here monitoring both the present-day effects of climate change, as well as the worldwide response. Understanding these decisions as a choice between one of two pathways—one that continues with the business as usual response and one that redirects to a future that remains “well below 2°C”—helps to bring the importance of recognising the effects of climate change and the necessary response to the forefront.

Evidence provided by the Intergovernmental Panel on Climate Change, the International Energy Agency, and the US National Aeronautics and Space Administration clarifies the degree and magnitude of climate change experienced today and contextualises these two pathways.

The impacts of climate change on human health

The world has observed a 1°C temperature rise above pre-industrial levels, with feedback cycles and polar amplification resulting in a rise as high as 3°C in north western Canada.^{1,2} Eight of the ten hottest years on record have occurred in the past decade.³ Such rapid change is primarily driven by the combustion of fossil fuels, consumed at a rate of 171 000 kg of coal, 116 000 000 L of gas, and 186 000 L of oil per s.^{4–6} Progress in mitigating this threat is intermittent at best, with carbon dioxide emissions continuing to rise in 2018.⁷ Importantly, many of the indicators contained in this report suggest the world is following this “business as usual” pathway.

The carbon intensity of the energy system has remained unchanged since 1990 (indicator 3.1.1), and from 2016 to 2018, total primary energy supply from coal increased by 1.7%, reversing a previously recorded downward trend (indicator 3.1.2). Correspondingly, the health-care sector is responsible for about 4.6% of global emissions, a value which is steadily rising across most major economies (indicator 3.6). Global fossil fuel consumption subsidies increased by 50% over the past 3 years, reaching a peak of almost US\$430 billion in 2018 (indicator 4.4.1).

A child born today will experience a world that is more than four degrees warmer than the pre-industrial average, with climate change impacting human health from infancy and adolescence to adulthood and old age. Across the world, children are among the worst affected by climate change. Downward trends in global yield potential for all major crops tracked since 1960 threaten food production and food security, with infants often the worst affected by the potentially permanent effects of undernutrition (indicator 1.5.1). Children are among the most susceptible to diarrhoeal disease and experience the most severe effects of dengue fever. Trends in climate suitability for disease transmission are particularly concerning, with nine of the ten most suitable years for the transmission of dengue fever on record occurring since 2000 (indicator 1.4.1). Similarly, since an early 1980s baseline, the number of days suitable for *Vibrio* (a pathogen responsible for part of the burden of diarrhoeal disease) has doubled, and global suitability

for coastal *Vibrio cholerae* has increased by 9·9% (indicator 1.4.1).

Through adolescence and beyond, air pollution—principally driven by fossil fuels, and exacerbated by climate change—damages the heart, lungs, and every other vital organ. These effects accumulate over time, and into adulthood, with global deaths attributable to ambient fine particulate matter (PM_{2.5}) remaining at 2·9 million in 2016 (indicator 3.3.2) and total global air pollution deaths reaching 7 million.⁸

Later in life, families and livelihoods are put at risk from increases in the frequency and severity of extreme weather conditions, with women among the most vulnerable across a range of social and cultural contexts. Globally, 77% of countries experienced an increase in daily population exposure to wildfires from 2001–14 to 2015–18 (indicator 1.2.1). India and China sustained the largest increases, with an increase of over 21 million exposures in India and 17 million exposures in China over this time period. In low-income countries, almost all economic losses from extreme weather events are uninsured, placing a particularly high burden on individuals and households (indicator 4.1). Temperature rise and heatwaves are increasingly limiting the labour capacity of various populations. In 2018, 133·6 billion potential work hours were lost globally, 45 billion more than the 2000 baseline, and southern areas of the USA lost 15–20% of potential daylight work hours during the hottest month of 2018 (indicator 1.1.4).

Populations aged 65 years and older are particularly vulnerable to the health effects of climate change, and especially to extremes of heat. From 1990 to 2018, populations in every region have become more vulnerable to heat and heatwaves, with Europe and the Eastern Mediterranean remaining the most vulnerable (indicator 1.1.1). In 2018, these vulnerable populations experienced 220 million heatwave exposures globally, breaking the previous record of 209 million set in 2015 (indicator 1.1.3). Already faced with the challenge of an ageing population, Japan had 32 million heatwave exposures affecting people aged 65 years and older in 2018, the equivalent of almost every person in this age group experiencing a heatwave. Finally, although difficult to quantify, the downstream risks of climate change, such as migration, poverty exacerbation, violent conflict, and mental illness, affect people of all ages and all nationalities.

A business as usual trajectory will result in a fundamentally altered world, with the indicators described providing a glimpse of the implications of this pathway. The life of every child born today will be profoundly affected by climate change. Without accelerated intervention, this new era will come to define the health of people at every stage of their lives.

Responding to climate change for health

The Paris Agreement has set a target of “holding the increase in the global average temperature to well below

2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1·5°C.” In a world that matches this ambition, a child born today would see the phase-out of all coal in the UK and Canada by their sixth and 11th birthday; they would see France ban the sale of petrol and diesel cars by their 21st birthday; and they would be 31 years old by the time the world reaches net-zero in 2050, with the UK’s recent commitment to reach this goal one of many to come. The changes seen in this alternate pathway could result in cleaner air, safer cities, and more nutritious food, coupled with renewed investment in health systems and vital infrastructure. This second path—which limits the global average temperature rise to “well below 2°C”—is possible, and would transform the health of a child born today for the better, right the way through their life.

Considering the evidence available in the 2019 indicators, such a transition could be beginning to unfold. Despite a small increase in coal use in 2018, in key countries such as China, it continued to decrease as a share of electricity generation (indicator 3.1.2). Correspondingly, renewables accounted for 45% of global growth in power generation capacity that year, and low-carbon electricity reached a high of 32% of global electricity in 2016 (indicator 3.1.3). Global per capita use of electric vehicles increased by 20·6% between 2015 and 2016, and now represents 1·8% of China’s total transportation fuel use (indicator 3.4). Improvements in air pollution seen in Europe from 2015 to 2016, could result in a reduction of Years of Life Lost (YLL) worth €5·2 billion annually, if this reduction remained constant across a lifetime (indicator 4.2). In several cases, the economic savings from a healthier and more productive workforce, with fewer health-care expenses, will cover the initial investment costs of these interventions. Similarly, cities and health systems are becoming more resilient to the effects of climate change; about 50% of countries and 69% of cities surveyed reported efforts to conduct national health adaptation plans or climate change risk assessments (indicators 2.1.1, 2.1.2, and 2.1.3). These plans are now being implemented, with the number of countries providing climate services to the health sector increasing from 55 in 2018 to 70 in 2019 (indicator 2.2) and 109 countries reporting medium to high implementation of a national health emergency framework (indicator 2.3.1). Growing demand is coupled with a steady increase in health adaptation spending, which represents 5% (£13 billion) of total adaptation funding in 2018 and has increased by 11·8% over the past 12 months (indicator 2.4). This increase is in part funded by growing revenues from carbon pricing mechanisms, with a 30% increase to US\$43 billion in funds raised between 2017 and 2018 (indicator 4.4.3).

However, current progress is inadequate, and despite the beginnings of the transition described, the indicators published in the *Lancet* Countdown’s 2019 report are suggestive of a world struggling to cope with warming that is occurring faster than governments are able, or willing to

UK; Centre on Climate Change and Planetary Health (K Belesova PhD, R Lowe PhD) and Department of Public Health, Environments, and Society (J Milner PhD, Prof P Wilkinson FRCP), London School of Hygiene & Tropical Medicine, London, UK; Cooperative Institute for Research in Environmental Sciences and Environmental Studies (Prof M Boykoff PhD) and Center for Science and Technology Policy Research (O Pearman MEM) University of Colorado Boulder, Boulder, CO, USA; Department of Public Health and Clinical Medicine (M O Sewe PhD, Prof J Rocklöv PhD) and Department of Epidemiology and Global Health (Prof P Byass PhD, M Nilsson PhD), Umeå University, Umeå, Sweden; Department of Earth System Science, Tsinghua University, Beijing, China (Prof W Cai PhD, Prof P Gong PhD); Department of Public Health and the Environment (D Campbell-Lendrum DPhil, T Neville MSc) and Global Malaria Programme (L Fernandez Montoya MSc), WHO, Geneva, Switzerland; School of Psychology, Cardiff University, Cardiff, UK (S Capstick PhD, P Haggart PhD); Institute for Environmental Sciences, University of Geneva, Geneva, Switzerland (J Chambers PhD); Department of Environmental Studies, University of New England, Biddeford, ME, USA (M Daly PhD); School of Government, University of Birmingham, Birmingham, UK (N Dasandi PhD); Yale Climate Change and Health Initiative (Prof R Dubrow PhD) and Department of Anesthesiology (J Sherman MD); Yale University, New Haven, CT, USA; Department of Global Health (Prof K L Ebi PhD) and Centre for Health and the Global Environment (J Hess PhD); University of Washington, Washington, DC, USA; Department of Civil and Environmental Engineering, Northeastern University, Boston, MA, USA (M Eckelman PhD); Department of Fish and Wildlife Conservation, Virginia Polytechnic Institute and State University, Blacksburg, VA, USA
