

Appendix F: Original Comments

Part 1 of 2

This appendix contains:

- All original comments submitted to Ecology
- An index of all individuals who submitted comments

Ecology reviewed and considered all submitted comments before finalizing this document.

Due to its large size, this appendix has been broken into two separate files. It is available on [Ecology's website](#).

To request an ADA accommodation, contact Ecology by phone at 360-407-6831 or email at ecyadacoordinator@ecy.wa.gov or visit <https://ecology.wa.gov/accessibility>. For Washington Relay Service or TTY call 711 or 877-833-6341. Visit Ecology's website for more information.

SUBMITTED: DOE PUBLIC COMMENT FORM

September 24, 2020

To Washington State Department of Ecology Review Board,

On behalf of the Longview City Council we express our enthusiastic support of the Northwest Innovation Works (NWIW) proposed methanol project in Kalama, Washington.

The founder of the City of Longview, Robert A Long, was an individual with a grand vision for development and industry along the Columbia River water highway.

NWIW is such an industry being proposed along the Columbia River, and the Longview City Council recognizes that the NWIW project will contribute to our community as a whole by offering an abundance of family wage jobs desperately needed for a sustainable and vigorous economy. Not only will this project employ 1,000 workers during construction and 200 to operate the facility upon the completion of construction, the investment in the NWIW project will provide a much-needed boost to a struggling Cowlitz County economy, promising to generate \$30-40 million in new local taxes.

The tax contributions that Northwest Innovation Works will contribute to Cowlitz County as a whole, the City of Kalama (including Kalama schools, and Kalama Fire District #5), and the State of Washington will be significant and will add to a robust tax base to help build up the surrounding communities offering improved and more efficient roads, public safety, infrastructure and schools.

We celebrate the fact that the proposed NWIW project will provide for the first "Zero Liquid Discharge" system on the Columbia River and the removal of 9.7 to 12.6 metric tons in climate change-inducing carbon dioxide annually. This facility will protect the Columbia River system by recycling 100% of the plant's wastewater and provides for a significant positive impact on global greenhouse gas emissions- the equivalent to removing approximately 2.2 million cars off -the road. This is the win-win we have been looking for in Southwest Washington.

We are encouraged by the positive environmental and economic benefits this project offers and the thorough review by the Department of Ecology over the past seven years. The Longview City Council urges the Department of Ecology to promptly issue the necessary permits for this project to proceed.

Respectfully,

A handwritten signature in blue ink that reads "MaryAlice Wallis". The signature is fluid and cursive, with a large loop at the end.

RE: Comments on the Draft Second Supplemental Environmental Impact Statement for the Kalama Manufacturing and Marine Export Facility (Ecology Publication 20-06-011)

Dear Mr. Doenges,

Thank you for the opportunity to comment on the Draft Second Supplemental Environmental Impact Statement (DSSEIS) for the Kalama Manufacturing Marine Export Facility (KMMEF). As you know, Cowlitz County is the Nominal Co-Lead Agency with the Port of Kalama for the original FEIS and SEIS for the KMMEF project. Separately, Cowlitz County is a regulatory agency sharing responsibility with the Department of Ecology (Ecology) for implementation of the Shoreline Management Act. With such roles, the County's comments are focused on the overall SEPA review as applied by Ecology, and not on specific, technical presentations within the DSSEIS. Detailed commentary on such presentations is being submitted by County's co-lead, the Port of Kalama, and for purposes of economy the County would incorporate as its own the contemporaneous comments submitted by the Port.

As an agency asserting jurisdiction in this matter, Ecology concluded that the Port's and County's draft of the first SEIS warranted additional discussion of the impacts of the project's potential greenhouse gas (GHG) emissions – as well as the mitigation of those impacts. This led to Ecology's preparation of the DSSEIS which broadened the scope of analysis of GHGs associated with the KMMEF project. Ecology chose to pursue an SSEIS. The County's position is that your DSSEIS, as written, expands the scope of the Port and County's original SEIS analyses beyond all legal standards and authorities established for SEPA. Simply stated, the DSSEIS improperly clouds and endeavors to supplant the existing SEPA record of probable impacts under a reasonable review of KMMEF.

First, the DSSEIS reaches beyond your agency's legal authority under SEPA by hypothesizing about end uses unsupported by the established purpose – on record – for the KMMEF project. The DSSEIS relies upon remote and speculative scenarios for KMMEF to then assess "possible" project impacts – contrary to SEPA mandates to assess "probable" impacts of reasonable scenarios. The County believes the SSEIS, as written, is improper application of the State Environmental Policy Act, and should not be relied upon by itself to make permit decisions for the KMMEF project.

Secondly, the DSSEIS, as written, fosters unnecessary confusion about the content and measure of the official SEPA record of the KMMEF project. By example, the DSSEIS recites an inaccurate presentation of the findings and conclusions of the original SEIS. By further example, the DSSEIS offers misrepresentations and mischaracterizations when advocating how the data and analyses within the DSSEIS compare to the data

and analyses in the original SEIS. It must not be lost on Ecology when it revisits its DSSEIS that the records for the FEIS, SEIS and final SSEIS contain an amalgamation of information for comprehensive consideration which is required for a thorough and adequate and legal environmental review. The name of the document – “supplemental” – defines the purpose of the SSEIS, as to supplement the record and not supplant the records of the SEIS or EIS.

In sum, the County would encourage Ecology to revisit its decision to use hypothetical and speculative end use scenarios and to confine its review to gaging the probable environmental impacts of the KMMEF project. Finally, the County requests that Ecology, for its SSEIS, revisit and fully and accurately represent the facts, findings and conclusions of the original SEIS within the SSEIS.

Sincerely,

A handwritten signature in blue ink, appearing to read 'RMel', with a long horizontal flourish extending to the right.

Ron W. Melin, CFM
Planning Division Manager
SEPA Responsible Official
Cowlitz County

Port of Kalama

Comments from the Port of Kalama are contained in the attached letter.

**RE: Comments on the Kalama Manufacturing and Marine Export Facility Draft
Second Supplemental Environmental Impact Statement Ecology Publication 20-06-
011**

Dear Mr. Doenges,

The Port of Kalama (Port) submits the following comments on the Draft Kalama Manufacturing Marine Export Facility (KMMEF or Project) Second Supplemental Environmental Impact Statement (DSSEIS). The Port appreciates the significant work that the Department of Ecology (Ecology) invested in the DSSEIS and its efforts to timely publish this draft. While the DSSEIS broadens the scope of the analysis from that contained in the Port and Cowlitz County's (County) original Supplemental Environmental Impact Statement (SEIS), and in some cases in ways that the Port believes to be beyond the State Environmental Policy Act (SEPA), the Port notes that the DSSEIS concurs in two fundamental conclusions:

(1) the impacts from the in-state Greenhouse Gas (GHG) emissions from the Project are capable of being mitigated; and

(2) global GHG emissions from the manufacture of olefins are expected to be less if the Project is built than under a no action scenario.

The Port concludes that Northwest Innovation Work's (NWIW's) commitment to fully mitigate for in-state emissions, however, reduces the Project's GHG impacts to a less than significant level, and has several questions and concerns regarding some of the analysis undertaken and assumptions used in the DSSEIS.

First, the DSSEIS creates confusion by not fully (or in some cases accurately) describing the contents of the original SEIS and how that data compares to the data and analysis in the DSSEIS. Because both the original SEIS prepared by the Port and the County together with this SSEIS prepared by Ecology will serve as the complete environmental record upon which the Project permits should be evaluated, it is imperative that the Final SSEIS (FSSEIS) provide

decision makers and the public with a complete and accurate explanation of the contents of each, including how they are consistent and how they vary. The Port accordingly requests that the FSSEIS be corrected to accurately present the full record.

Second, the DSSEIS reaches beyond SEPA by assuming end uses and Project purposes that are neither proposed by NWIW nor reasonably foreseeable and by evaluating scenarios which the DSSEIS describes as “unlikely.”¹ Evaluating “unlikely scenarios” and “possible” impacts,² rather than probable impacts from foreseeable scenarios, is speculation and is not permitted under SEPA.³ It also unnecessarily confuses the public. Two examples of this include the unsupported assumptions regarding the use of KMMEF methanol as fuel and the range of market substitutions scenarios evaluated to forecast GHG emissions from global methanol demand. As discussed in more detail in the separate comment letter submitted by Mark Berggren from Methanol Market Services Asia (MMSA), with a careful and more accurate evaluation of global methanol market data, likely alternative sources of supply, including several recent announcements of new coal-to-methanol projects in China, the High Coal Case (HCC) alternative scenario is actually the much more likely Reference Case (RC) for GHG emission evaluation. The Port requests that the FSSEIS include this correction, which confirms that the Project is likely to provide greater GHG benefits than currently represented.

Third, the DSSEIS’s statements and conclusions regarding the significance of the life cycle GHG emissions of KMMEF, particularly when compared to the no-action alternative, are ambiguous and not supported by the document’s conclusions. Decision makers and the public would benefit from a clear conclusion as to the effectiveness of the Project’s proposed mitigation program and the substantive effect, under SEPA, of the market displacement analysis.

The FSSEIS should clearly recognize that with the proposed mitigation program for in-state GHG emissions, and based on the expected reduction in global GHG emissions if the Project is built, GHG impacts cannot be labeled as significant. As currently drafted, the

¹ DSSEIS at 55 (“These represent two unlikely cases that could transpire, although they depend on a specific combination of input variable values. These outlier cases are intended to show what would happen in the lower probability scenarios.”) (emphasis added).

² See, e.g., DSSEIS at 18 (“It is possible, however, that the methanol could be used as a fuel once it is acquired by importers in Asia and elsewhere.”); *id.* (“The SEPA environmental review process helps state and local agencies identify and consider possible environmental impacts that could result from government actions, including the issuance of permits.”); *id.* at 20 (“A sensitivity analysis providing a range of possible GHG emissions is also provided.”) (emphasis added).

³ WAC 197-11-060(4)(a); WAC 197-11-080 (defining “probable” as “...likely or reasonably likely to occur, as in ‘a reasonable probability of more than a moderate effect on the quality of the environment’... Probable is used to distinguish likely impacts from those that merely have a possibility of occurring, but are remote or speculative. This is not meant as a strict statistical probability test.”).

document avoids that obvious conclusion. It is confusing at best, if not nonsensical to conclude impacts are significant, when they are reduced to net zero through in-state mitigation, and globally are less if the Project is built than would be the case if the Project is not built. The SSEIS should objectively and accurately recognize these facts.

The next section of this letter elaborates on these over-arching concerns. The second section, then identifies in detail (with reference to DSSEIS section or page) the specific places in the document where corrections, revisions or clarifications are required.

I. KEY ISSUES

A. The Public Benefits from Improved Disclosure of Complementary Content in Both the DSSEIS and 2019 SEIS.

Notwithstanding significant overlap and consistency in content, the DSSEIS and Ecology's public hearing presentations go to great effort to distinguish Ecology's analysis from the SEPA Responsible Official's (SRO's) SEIS. This effort doesn't serve the public's interest in full disclosure of the entire SEPA record. The Port requests corrections to ensure the FSSEIS is fair and accurate in its depiction of SEIS statements. The following table identifies statements in the DSSEIS that should be corrected:

DSSEIS Statement	Correction Requested
DSSEIS, p. 22: "The SEIS found that the proposed project would reduce greenhouse gas emissions globally by between 12 and 14 million metric tons annually."	This misstates information from the SEIS. The SEIS, Section 3.5.6 states that the Project "results in the potential for a net reduction in overall cumulative GHG emissions from the proposed project of between 9.6 and 12.6 million metric tonnes CO _{2e} " annually. Note this same mischaracterization occurs elsewhere on page 22.
DSSEIS, p. 22: Ecology characterized their comment letter as follows: "Among other things, Ecology questioned the Draft SEIS's conclusion that the proposed project would have no significant adverse environmental impacts."	This is an overly simplistic summary of Ecology's comment letter. There are several locations within Ecology's letter that provide suggestions on assumptions or analysis that could ultimately impact emissions calculations, but the letter notably lacks criticism or challenge to the actual conclusion that impacts would not be significant.
DSSEIS, p. 22-23: The DSSEIS states that the FSEIS's significance determination concluded that the project "would displace between 12 and 14 million metric tons of	The SEIS in section 3.5.6 states "The project would result in a displacement of GHG emissions of between 15.02 and 12.68 million metric tonnes CO _{2e} per year, assuming that an amount equal to the total volume of methanol produced by the proposed project is displaced."

<p>greenhouse gas emissions annually, and did not consider the use of methanol as fuel in determining the significance of the proposed project's environmental impacts under SEPA.”</p>	<p>The DSSEIS uses the wrong figure and also does not provide the same qualification regarding assumptions about displacement. The SEIS goes further into this analysis in Section 4.3.6 where comments regarding market displacement are discussed. The SEIS acknowledges that full displacement may not occur and even without that full displacement can result in emissions reductions:</p> <p style="padding-left: 40px;">In addition, the Final Supplemental EIS considered the effect of full displacement of an equal volume of methanol from coal-based processes in its analysis. Because of the significant differences in GHG emissions between the displaced methanol and the proposed project, a result that assumes less than total displacement would still result in GHG emissions benefits. Table 3.7 of the Final Supplemental EIS reports the total emissions calculated from the proposed project and the displacement effect. When considering the commitment to mitigate for Washington State emissions, the Project would result in the emissions of 1.58 to 2.05 MT CO_{2e} per year and the displacement of between 12.68 and 15.02 MT CO_{2e} per year. Based on these results, the Project would need to only result in displacement of approximately 12 percent of the production volume to result in neutral (no increase) GHG emissions.</p> <p>The SEIS also considered the emission that could be associated with methanol use as fuel. Section 4.3.7 contains a detailed discussion of this issue in responding to those comments on the DSEIS regarding methanol use as fuel. This provides a detailed discussion of the issue including calculations of the emissions that would result from using the entire yearly production as fuel. The oversimplification found within the DSSEIS should be corrected.</p>
<p>DSSEIS, Table 3.5-13 compares the</p>	<p>For example, Table 3.5-13 represents a much higher</p>

<p>assumptions used in the low, medium and high cases in each document, but omits clarification that some of the content identified as differing is actually contained elsewhere in the SEIS.</p>	<p>upper end value for the “Upstream, Construction, Decommissioning, Process, and Transport of the facility” row and a row for “End Use: Methanol to Fuel,” which is represented as missing from the SEIS. This is inaccurate. Both the impact of KMMEF being used as fuel and using the NW Power and Conservation Council’s marginal power mix were included in the original SEIS, but rather than including these variables in a low, baseline or high scenario, they were included as sensitivities and in response to comments because either their application was not probable or it was not the applicant’s Project proposal. <i>See</i> SEIS, Section 4.3.7. at 4-10—4-11 (Standard Response 7; summarizing the SEIS’s analysis of the potential use of fuel); SEIS, Section 4.3.4 at 4-6—4-8 (Standard Response 4; explaining why the NW Power and Conservation Council’s marginal mix was excluded from the low, baseline and high scenarios and explaining that “Appendix B evaluated the use of the marginal mix as reported by the Northwest Power and Conservation Council (NPCC), including calculating the annual GHG emissions, which are estimated at 0.37 million metric tonnes GHGs per year.”).</p>
---	--

The Port respectfully requests specific edits to the DSSEIS to easily connect the reader to analogous analysis in the SEIS throughout the document and a clearer identification of any new information not found in the SEIS (e.g., comparison of KMMEF to a Chinese natural gas-derived methanol). The Port offers our SEIS technical team to assist Ecology in accurately portraying and citing to the original SEIS.

B. Ecology’s Significance Determination Requires Clarification

Under SEPA, “the substantive decisions or recommendations” in an EIS “shall be clearly identifiable...” RCW 43.21C.031(1). The DSSEIS, however, lacks clarity as it concludes that the Project’s GHG impacts are significant (notwithstanding the conclusions of the global displacement analysis) and that GHG impacts are capable of mitigation, but lacks a clear conclusion as to whether NWIW’s voluntary mitigation plan achieves this outcome.

Given the DSSEIS’s global displacement analysis (net negative, regardless of replacement source), the appropriate determination is that the Project’s impacts are less than significant. SEPA requires that “[i]n assessing the significance of an impact, a lead agency shall

not limit its consideration of a proposal's impacts only to those aspects within its jurisdiction, including local or state boundaries.” WAC 197-11-060(4)(b). The DSSEIS assesses the Project’s GHG impacts on an in-state and global level and ultimately concludes that “plausible input values demonstrate that the KMMEF is expected to result in less GHG emissions increases than the alternate cases” and “that the KMMEF would slow the global increase in emissions arising from methanol production and use.” The DSSEIS further concludes that, as compared to the reference case (which assumes the Project will not be built), the Project will reduce GHGs from the methanol sector by 200,000- 9.5 million tonnes annually, with a best estimate of a **6 million tonnes reduction of GHGs annually** even including an assumption that 40% of KMMEF methanol is used as fuel rather than as an olefin feedstock **and** omitting credit for NWIW’s commitment to fully mitigate for in-state emissions.

The data in the DSSEIS is conclusive and consistent with the determinations of the original SEIS. When assessed globally, the Project provides clear and substantial GHG benefits that reduce the Project’s impacts to a less than significant level. NWIW’s voluntary mitigation plan provides a second basis for a less than significant determination.⁴ Section 3.7 of the DSSEIS lacks this ultimate conclusion in conflict with RCW 43.21C.031(1) and WAC 197-11-060(4)(b).⁵ The Port accordingly requests that Ecology’s conclusion on significance be changed to a less than significant determination consistent with the full SEPA record and, in particular, the conclusions of the DSSEIS.

C. The DSSEIS Confuses the Public by Placing Improper Emphasis on Fuel as an End Use

Responsive to substantial public comment, both the DSSEIS and the SEIS analyze fuel as a potential end use of KMMEF methanol. The SEIS included this analysis in Section 3.4.6 and Appendix A of the SEIS, but ultimately concluded that the end use of KMMEF methanol as a fuel was not appropriately a focus of the SEIS because it was not the project proposed by NWIW,⁶ the First Amendment to Dock Usage Agreement prohibits this outcome, and any

⁴ See, e.g., WAC 197-11-350 (“In making threshold determinations, an agency may consider mitigation measures that the agency or applicant will implement.”).

⁵ See also WAC 197-11-440(6)(c)(iv) (requiring that the EIS discuss the environmental benefits of mitigation).

⁶ By assuming that KMMEF will be used as fuel, rather than the Project’s stated purpose, Ecology breaks new ground under SEPA and analyzes a project not proposed by the applicant and potentially misleads the public on the Project and its probable environmental impacts. Confusion about the Project’s purpose and probable end use was a regular theme during the recent public hearings. The FSSEIS should be updated and reorganized to clarify that KMMEF methanol would be sold to olefin manufacturers and not used as fuel.

assumptions about KMMEF being used as fuel are unfounded.⁷ Choosing an end-use scenario that is contrary to stated Project purpose and inconsistent with market facts, and then calculating GHG emissions from that speculative end-use is inconsistent with SEPA and should be eliminated, or at a minimum, clearly labeled as an outlier anticipatory response to public comment without a factual basis. Additional evidence of the remote likelihood that KMMEF would be used as fuel is presented by the Port's consultant Mr. Berggren. As Mr. Berggren states, economic and regulatory restrictions in China further confirm that it is highly unlikely that KMMEF methanol will be used as a fuel.⁸

DSSEIS Section 3.4.6.2 and Section 3.5.3.1, however, establish a split for end use of the methanol produced by the KMMEF as 60% for olefin production with the balance of 40% being combusted as fuel and apply this split across the DSSEIS's low, medium and high cases.⁹ Neither this section of the DSSEIS, nor DSSEIS Appendix B, provides a reasoned basis for this end use split. Ecology's decision to employ an unsupported (and unexplained) assumption that 40% of KMMEF methanol will be used as fuel builds on the already specious nature of KMMEF being used as fuel at all, which again is prohibited under SEPA.¹⁰ It also misleads the public and future decision makers. The Port respectfully requests that the SSEIS be updated to limit its primary analysis to the production of olefins and to clarify the uncertainties and, at minimum, the disputed record underlying the fuel/olefin assumptions.¹¹

⁷ See SEIS, Section 4.3.7 at 4-10—4-11 (Standard Response 7; summarizing the SEIS's analysis of the potential use of fuel); SEIS, Appendix E, First Amendment to Dock Usage Agreement (June 12, 2019). This amendment provides a covenant that NWIW will not use the dock to sell any quantity of methanol as fuel, provides the Port the right to inspect records and if the prohibition is violated the Port will impose a surcharge of up to 300% of the normal cost to use the dock and under certain situations withdraw the right to use the dock for 1 year.

⁸ M. Berggren, Letter to Rick Doenges re KMMEF DSSEIS Comments (Oct. 9. 2020).

⁹ See DSSEIS, Table 3.5-13 at 84.

¹⁰ SEPA draws a clear distinction between "probable" impacts and "those that merely have a possibility of occurring, but are remote or speculative" and courts consistently hold that an EIS is not required to analyze potential future impacts that are "speculative" rather than "probable." See *City of Des Moines v. Puget Sound Reg'l Council*, 108 Wn. App. 836, 853-55, 988 P.2d 27 (1999); *Gebbers v. Okanogan Cty. Pub. Util. Dist. No. 1*, 144 Wn. App. 371, 386, 183 P.3d 324 (2008) (holding that an EIS properly omitted analysis of a "hypothetical and speculative" transmission line rebuild that may occur 10 to 15 years in the future).

¹¹ See SEIS, Section 4.3.7. at 4-10—4-11 (Standard Response 7 summarizing the SEIS's analysis of the potential use of fuel).

D. Additional Clarification is Needed on the Range of Upstream Emission Rates Used in the DSSEIS

The DSSEIS substantially replicates the range of fugitive emission rates assessed in the SEIS but deviates in two ways that require correction or additional support. First, the DSSEIS does not adequately support its decision to use the EPA Shale emissions factor as its medium case, rather than a regionally-specific number. The Port respectfully requests that Ecology reconsider this decision as it overstates the most likely case of Project impacts. Second, the DSSEIS contains a 3% upstream fugitive emission rate. The Port respectfully requests that Ecology cite the technical basis for this assumption to better understand Ecology's decision making or label this assumption a sensitivity included in response to comments.

The DSSEIS's evaluation of KMMEF upstream emissions should properly recognize that regionally-specific GHG emissions rates are the best information available of the Project's probable GHG emissions. The SEIS concluded that, due to geological, operational and regulatory variations between different natural gas basins, a regionally-specific value for fugitive emissions provides the most probable assessment of Project impacts. A regionally-specific emission factor is most appropriate because differences in geologic features can result in differences in extraction methods, resource composition (fractions gas, liquids), weather, infrastructure age, regional air quality regulations, and operator management practices all of which affect fugitive emission rates.¹² This is particularly true here, where Canadian regulations are effective in reducing fugitive release of methane. GHG emissions from Canada also reflect the country's adherence to GHG reporting protocols. Over 99% of KMMEF gas will come from British Columbia/Alberta. The DSSEIS's probable case impacts should be updated to be consistent with this context. The FSSEIS should also point out trends to reduce upstream GHG emissions per MMBtu from both the Canadian and U.S. inventory.

The Port appreciates that, like the SEIS, the DSSEIS assesses potential Project GHG impacts under a range of assumptions on upstream fugitive methane emissions. The SEIS evaluates 13 different upstream leakage rates ranging from 0.32 to 2.3% (the rate forwarded by the Stockholm Environmental Institute).¹³ SEIS, Appendix B (replicating a chart found in Appendix A) also provided decision makers with the impact of assigning the full EDF/*Alvarez* value to KMMEF emissions, even though a direct application of *Alvarez* was determined to be unsupported because it assigns all fugitive emissions to natural gas, whereas the wells being analyzed produce natural gas *and* oil (which is not a KMMEF feedstock) and so requires a disaggregation before application in a life cycle analysis.¹⁴ The DSSEIS, in contrast, uses a 3%

¹² Brandt, A., Ravikumar, A., Natural Gas Brief, July 2018.

¹³ SEIS, Appendix B at 20-22.

upstream emission rate in its high-end scenario, but does not cite a source of this assumption. Disclosure of the technical reports underpinning this decision would aid the Port in its decision making. Additionally, the FSSEIS should confirm that this upstream assumption is included as a sensitivity responsive to comments and is less plausible than other, regionally specific and more technically supported fugitive emission rates.

II. TECHNICAL COMMENTS

The following technical item comments are organized by section of the DSSEIS and provide additional detail and comments to the issues raised above:

Fact Sheet: Under the description of the Project in the fact sheet as well as in Section 2.1 and 2.4, the DSSEIS notes the ability of the Port to use the dock for a layberth. For completeness, this should be corrected to include the number of layberth events allowed per year. The shoreline permit issued by the County includes a limit of 12 and this number was reflected in other permits and reviews.

Section 1: The summary does not include the minimum requirements specified in WAC 197-11-440(4). Notably absent are a summary of the impacts and the mitigation proposed by NWIW.

Section 1.1: The first paragraph included both the stated purpose of the Project but also the assumption from the DSSEIS author's conclusion that the methanol could be used as a fuel. This section should be revised to differentiate between the stated Project purpose and the assumptions used by Ecology in conducting the analysis.

Section 1.3: This section incorrectly notes the environmental record that will be used by Ecology in determining whether or not action needs to be taken on the issued Shoreline Conditional Use Permit. The environmental record includes the 2019 SEIS and the original 2016 EIS per WAC 197-11-600 and WAC 197-11-620.

Section 1.4.1: This section provides a regulatory and legal review of the process including a summary of the Shoreline Conditional Use permit process. It indicates that the Conditional Use Permit was issued for "the proposed project". To provide a complete picture of the process it is important for the FSSEIS reader to recognize that the Conditional Use Permit is not for the entirety of the Project but rather for discrete elements. These elements are dredging (within the Urban Shoreline District only) and limited industrial uses within the Conservancy Shoreline District (portions of the fire water storage pond, portions of the tank containment,

¹⁴ See Appendix B, Section 3.3 at 21 ("Total fugitive emissions reported in the EDF studies correspond to oil and gas production and therefore it is necessary to allocate total fugitive emissions between the crude oil and the natural gas produced by the same well. The allocation depends upon the amount of associated gas produced with crude oil.").

portions of the infiltration pond, security fencing and necessary site grading). It is requested that an explanation of this fact be added along with consideration of the GHG emission resulting from these specific elements of the Project.

Section 1.4.1: A discussion of RCW Chapter 70.235 is included in this section devoted to the Determination of Significance (DS) issued by Ecology for the DSSEIS. It is not clear the relevancy of this specific RCW in the context of the DS. This RCW is not mentioned in the scoping notice nor in the letter provided from Ecology to the County on November 22, 2019. This discussion should be removed from this section or the relevancy clearly stated for the decision makers.

Section 2.1 and 2.5.2: This section notes the connected actions of the natural gas pipeline and the electric transmission line. Readers would benefit from additional information regarding these connected actions in order to fully understand the GHG emissions (or lack thereof) from these actions. This could be accomplished by adding a simple description of these separate projects and/or referencing more directly where this information is located in the SEIS or the original FEIS.

Section 2.2: A brief summary of Project related actions is included at the end of this section. The list does not mention mitigation proposed by or imposed on the Project including the habitat mitigation actions such as habitat improvements and preservation actions. For completeness mitigation should be noted in this section.

Section 3.2: This section is devoted to the “affected environment” for GHG emissions included in the DSSEIS. This section includes a discussion (similar to that in the SEIS) that reflects the global nature of climate change and the fact that it is not meaningful to link a specific climate change effect (e.g., sea level rise) to a specific Project emission source. What this section (and the rest of the DSSEIS) lacks is clear articulation of what this means. The DSSEIS spends a considerable amount of time describing the Project related (both direct and indirect) emissions but nearly ignores the context (except for the state level which has limited relevance to actual climate change impacts from global GHG emissions). The SEIS provides a more detailed discussion of this in Section 3.5.1 as noted below:

The life-cycle GHG emissions of the proposed project would be added to the global GHG emissions from past activities, emissions from current activities, and the future emissions that would contribute to the cumulative increase in GHG emissions that result in climate change.

Because it is not possible to tie a particular climate change impact to individual emissions, it is not possible to identify or quantify specific direct environmental impacts from the GHG emissions of the proposed project. Therefore, the impact analysis is inherently a cumulative impacts analysis of the indirect effects of the GHG emissions. It is the resulting climate change effects that take place in the future and distant from the

project that are the relevant impacts. In this section, the impacts are based on GHG emissions and described separately by category and on an overall basis. To provide appropriate context and intensity for evaluation of impacts as required under SEPA, the GHG emissions are described in the context of both overall state and global GHG emissions levels.

We request that a similar discussion be added the FSSEIS so that decision makers clearly understand the contribution (or lack thereof) of this Project to global climate change. WAC 197-11-060(4)(b) (“In assessing the significance of an impact, a lead agency shall not limit its consideration of a proposal’s impacts to those aspects within its jurisdiction, including local and state boundaries”); WAC 197-11-794 (assessment of significance requires consideration of “context and intensity”). We further request that the DSSEIS characterize the Project’s global GHG emissions in direct comparison to global GHG emissions, which were estimated in 2018 to be 53.5 billion metric tonnes CO_{2e}, in addition to state level comparison currently included in the document.

Figure 3-1: This figure is not referenced in the text and no context is provided. In addition, it includes emissions from the KMMEF without any explanation and before emissions from the Project are even discussed. This could lead to confusion and question of relevancy to the analysis of emission from the Project. An explanation should be added and relevancy to determination of impacts under SEPA should be added to Section 3.2.1 or this figure should be removed.

Section 3.3.3.2: The last sentence of this section requires clarification. According to the Port’s understanding these provisions of the Washington Clean Air Act only require reporting of emissions while the section refers to “reduction or mitigation requirements.”

Section 3.3.3.8: Section 3.3, Regulatory Setting, indicates that the section summarizes laws, regulations, etc. that address “GHG” emissions. Section 3.3.3.8 summarizes the Shoreline Management Act. As noted in the first SEIS, there are no provisions within the Cowlitz County Shoreline Master Program or the Shoreline Management Act that specifically address GHG emissions. This discussion of the Shoreline Management Act should either be removed, moved to a separate section outside regulatory provisions related to GHG emissions or language added that acknowledges that it does not specifically address GHG emissions.

Section 3.4.2: This section on upstream emissions contains statements regarding methane and notes that is a far more potent GHG than carbon dioxide. This statement is an oversimplification of methane as a GHG and could lead to an overemphasis on methane emissions as viewed by the public and by decision makers as compared to carbon dioxide. We request that this paragraph be eliminated or additional information added to provide the necessary background. For example, although methane has more warming potential per unit, it is also much shorter lived (which means that the carbon dioxide emitted today will last in the

atmosphere much longer than methane). Also, methane constitutes only a small percentage of overall GHG emissions from the Project, the bulk of which are carbon dioxide. The focus of the DSSEIS's LCA should accordingly be on overall GHG emissions and not a particular gas and that Project operation reduces global GHG emissions as compared to the no action scenario.

Section 3.4.2: Table 3.4-1a does not accurately represent the upstream emission rates considered in the SEIS. Specifically this does not identify the Upper Emissions scenario which utilized the GREET/EDF values. Please correct the table to reflect this fact.

Section 3.4.4.2.2: The Reference Case for imported methanol includes upstream emission errors that likely underestimate of overall GHG emission. Upstream emissions from imported natural gas appear to have two errors. First the upstream emission values appear to be based on the same volume of natural gas for both the KMMEF and for the foreign imports. This is inaccurate because the combined reforming (CR) method uses more natural gas per unit of methanol than the ULE technology proposed for the KMMEF. The second error is use of the same upstream emission rate for all sources of imported natural gas. Upstream emission profiles can vary significantly between geologic basins due to, in part, variation in extraction methods, operations, and regulation. More research should be conducted to provide more accurate assessments of upstream emission rates for the various sources of methanol. For example the number one exporter to China is indicated as Iran (see Table 3.5-9). The International Energy Agency indicates a leak rate for Iran that is approximately 1.4%, which is twice that used in the DSSEIS. The Port accordingly requests that the DSSEIS reflect more accurate upstream emission rates or acknowledge the uncertainty surrounding the assumptions used.

Section 3.4.5.1: The DSSEIS states that "KMMEF is assumed to be a "price-taker" (as is expected in a competitive commodity market), meaning that the facility would take the price offered; it is not expected to impact global supply in a way that could affect the price." We agree that the KMMEF will be a price taker. For clarity, this discussion should focus on the fact that the market is growing and the statement that price takers do not affect supply/demand should be edited to reflect a more accurate statement. The DSSEIS should also be updated to clarify that KMMEF is lower cost than coal alternatives and so is able to remain operational (remain a price taker) when higher cost, coal-derived methanol is priced out. This provides additional support for Ecology's displacement analysis conclusions.

Section 3.5.1.2: The maximum potential to emit scenario is first mentioned in this section (and is referenced elsewhere) for emissions for the KMMEF process. The EIS does not do a sufficient job of explaining this scenario and why it is unlikely that this scenario would occur. While a decision maker may ultimately be able to find this information in the environmental record, we request that information be added to this section addressing this scenario. It also warrants reference to the Southwest Clean Air Agency air permit limit on GHG emissions.

Section 3.5.1.5.2: Figure 3.5-3 should be changed to report fuel use in a similar unit as the remainder of the document so users can make an easier comparison. The most used unit is metric tonnes.

Section 3.5.3.1: Regarding the following bullet point:

- Oil prices are assumed to remain stable at present levels – about \$40/barrel. If oil prices increase or decrease, then it is expected that correspondingly less or more naphtha based olefins would be produced, shifting the demand for methanol.

This is unclear whether lower oil prices shift demand for methanol vs. the demand for feedstocks to make methanol. Please add the following clarification to the FSSEIS: “If oil prices increase or decrease, then it is expected that correspondingly less or more naphtha based olefins would be produced, shifting the demand for naphtha as an olefin feedstock.”

Figure 3.5-11: The legend for this figure includes a “Naphtha to Olefin” category. It does not appear that Figure 3.5-11 shows emissions that would come from this scenario.

Section 3.6.1: This section discusses sensitivity analysis related to the use of different Global Warming Potential (GWP) methodologies. In this location as well as in other sections of the EIS the emissions are primarily calculated based on the AR4 100-year GWP. The Port agrees that the use of the AR4 100-year GWP is the most appropriate for the Project. However, for clarity for decision makers we request that more justification be provided for use of this GWP. Section 3.4.2 of the SEIS notes that the AR4 100-year GWP was used for consistency with international, United States, and Washington reporting requirements and contains a more detailed discussion of the GWPs. We also request that this section specifically note that the GWPs do not change the emissions from the Project. This section states “Moving from the 100-year AR4 result to the 20-year AR5 result, the difference in average annual emissions between KMMEF and the Alternate Cases increases by 15 percent for the RC, 13 percent for LCC, and 11 percent for HCC.” This statement is misleading in that it says emissions increase. In fact the actual emissions do not increase only the comparison of the warming effects related to CO₂e. More clarity is needed.

III. CONCLUSION

Ecology, the Port and the County have engaged in two rounds of exhaustive analysis of the GHG impacts of the KMMEF from well head to end use. After rigorous scrutiny, both analyses concurred that with or without the Project new sources of methanol will come on line to produce olefins and that KMMEF will out-compete significantly more impactful sources of methanol. Whether a decision maker finds Ecology’s estimate of 6 million tonnes of net benefit or the SEIS range of 9.6 and 12.6 million metric tonnes CO₂e of annual GHG reductions more persuasive is largely immaterial in assessing significance. Under either set of modeling parameters, this Project has significant GHG benefits to foreseeable global emissions. The Port

is also unaware of any EIS that has concluded that when a project fully mitigates for in-state impact, its impacts are significant. Consistent with the regular application of SEPA, NWIW's commitment to fully mitigate for in-state GHG emissions reduces their GHG impacts to a less than significant level.

In addition to reducing global GHG emissions as compared to the no action alternative, the proposed KMMEF would also provide extraordinary, long-term benefits to the state and local economies and will generate new jobs in Southwest Washington. Cowlitz County could use this stimulus—it is one of the most economically challenged communities in Western Washington with higher than average unemployment, lower wages and lower labor participation rates. The economic impact of COVID-19 has made the situation even more dire and in April 2020 nearly 15 percent of the county workforce filed for unemployment. The construction of this Project would offer huge benefits for Cowlitz County:

- 1,000 workers— laborers, electricians, welders, carpenters, ironworkers and administrative support— during construction;
- More than \$467 million in local goods and service purchases; and
- \$289 million in local wages, salaries and benefits.

Ongoing operations will also create many long-term, family-wage jobs as the Project is expected to directly employ 192 full-time workers at the facility and pay \$21 million in total compensation. When indirect and induced economic effects are included, a total of 688 jobs a year are attributed to the facility. State and local jurisdictions would receive significant tax revenues. NWIW will pay \$58 million in taxes during construction and \$30-\$40 million in annual taxes during operations. This means significant revenue to pay for roads, schools, fire services, infrastructure and more.

There are few (if any) places in the world where methanol manufacturing would be subjected to a more exacting regulatory review than in Washington. The state's economic, environmental and climate commitments are best reflected in a timely completion of this environmental review and the approval of all outstanding authorizations.

Sincerely,

When faced with facts, wise people listen. They evolve. They show an openness to science. The value of science is that it doesn't care about our politics or opinions – it just tells us what works.

Six years into studying the science of the proposed NWIW methanol facility in Kalama, one fact has emerged above all others: The construction and operation of this plant would reduce harmful greenhouse gas emissions globally, at meaningful levels, representing the single largest initiative Washington State could undertake in our fight against climate change.

For those who have been against the project and asked questions throughout this process, those questions have been heard. Thousands of comments were considered in the drafting of these reports, including comments from the leading environmental groups in this country.

Opinions are opinions; facts are facts. We can now say it's a fact NWIW Kalama is good for the environment. Now it's time to set opinions aside and believe in the science. Wise people listen to science not just when it's convenient. Let's get to work and build this.

Thank you!

Say Yes to Life Swims LLC

This proposed project is an environmental disaster in the making! If built, the Kalama project would unleash more gas, and therefore more fracking, than is used by all of the NW's biggest cities--COMBINED. It would more gas, and therefore more fracking, than is used by all of the power plants in Washington State!

The analysis that petrochemical boosters present is both rhetorically deceptive and analytically wrong. Energy modelers looked at the project forward and backward, right-side up and upside down. What they found is that unequivocally and under every set of assumptions, the project would be one of the top polluters in Washington.

It is beyond foolhardy to even consider building such a horrific project. NO!

Guila Muir, Founder
Say Yes to Life Swims LLC

Say Yes to Life Swims LLC

This horrific proposed project would cause a huge amount of climate pollution. It would boost climate emissions "upstream" (from fracking and piping the gas), on-site (as the petrochemical refinery converts gaseous methane into the liquid petrochemical methanol), and "downstream" (from converting the methanol into plastics or vehicle fuel, and then burning that fuel).

There is absolutely no way in which the Kalama methanol project would "reduce" or "remove" carbon emissions. It would add carbon pollution—4.6 million tons of carbon dioxide pollution each year. That's staggering.

Don't let lies about "clean energy" sway you. This project cannot be considered. Thank you.

Re: Comments: Kalama Manufacturing and Marine Export Facility Second Supplemental EIS

Date: October 7, 2020

Dear Dept. of Ecology,

I am offering comments on the Kalama Manufacturing and Marine Export Facility Second Supplemental EIS, specifically on the Northwest Innovation Works (NWIW) Kalama Voluntary Greenhouse Gas Mitigation Program Framework (Appendix D: Mitigation Framework). I have been involved in carbon markets since the mid-2000's as a consultant and contractor. In 2015, Evergreen Carbon was launched to provide meaningful, high value carbon credits to businesses and individuals.

I have firsthand knowledge of a multitude of carbon projects, in industrial, agriculture, forestry, and renewable energy (solar and wind installations). I have worked with a South Korean client, consulting on a long-term "forward" contract, providing carbon credits for the South Korean compliance market. Evergreen Carbon also has several local Washington State based clients who voluntarily purchase carbon credits. I bring expertise in several types of carbon projects; Landfill Gas projects, dairy digesters, agriculture (soil carbon projects), energy efficiency, renewables – wind and solar, N₂O abatement in Nitric Acid production, Ozone Depleting Substances, forestry and carbon capture and storage (CCS). I have been from northern British Columbia to the Andes in Peru (including carbon projects in WA) doing this carbon work.

In my review of the Voluntary Mitigation Plan (VMP), I found that the practicality of implementation could be expanded on. I hope that my comments are helpful to Ecology in providing further context of how a new multi-million-dollar ongoing fund that the VMP will create could be implemented.

Fund Value

The funds provided to the carbon market will have a significant impact. The VMP creates an annual fund based on the California allowance price. Given that the trading price for the August 2020 joint CA-Québec allowance auction is \$16.68, it is reasonable to expect an annual fund starting at \$17 million (@1 million MT of GHG/year). This is a significant fund that will enable the project to keep its mitigation commitments, but have additional funds that can be invested into new carbon projects and perhaps other projects and programs that support a low carbon future for Washington State. Because the price of carbon credits on the voluntary market has always been less than the CA/Québec auction price, there will always be extra funds available after carbon credits are purchased for direct, immediate mitigation.

Meeting Demand

To meet the carbon credit demand, the investment will have to be on multiple fronts, satisfying both short-term purchases and long-term investment into new carbon projects. New carbon projects are typically faced with a challenge of finding financing to get a new project started. The NWIW fund can invest in new projects, and create agreements to purchase carbon credits when they are available. A floor price can be agreed to, so the project itself will have a guaranteed revenue stream and use the agreement with NWIW to attract other funders or guarantee supporting loans from other sources. Because of an expected tightening of the carbon market supply, funding new projects and entering into future purchase contracts will be an important strategy to meet carbon mitigation commitments.

Starting with a local commitment, the NWIW fund will have a direct local economic stimulus. Currently, Cowlitz country does not have any registered (CAR, VCS or ACR) carbon projects. The NWIW fund will allow for the development of carbon projects on Cowlitz country dairy farms (digester projects) and install a LFG collection and destruction systems on the Cowlitz Country Landfill. NWIW will need a plant to assess the potential for other new carbon projects in Cowlitz County and elsewhere in WA. Looking close to home for new carbon projects and elsewhere in the PNW is a priority that I support. A best outcome would be that dairy farms digesters and other carbon removal projects will be the norm after a time – and the NWIW fund will foster this. When carbon projects become Business As Usual, the carbon project registries will recognize this, and carbon credits will no longer be earned under a BAU scenario. We are a long way from that, yet, the NWIW fund will still be there, and will continue to invest in areas that are not yet BAU. This is many years away, if it can be reached at all.

Cowlitz County and WA can support many types of carbon projects, and the investment from NWIW will support the development of many projects. Sectors we can consider in WA include Landfill Gas Capture and destruction, Livestock (dairy digesters), Forestry (Improved forest management and reforestation), Other Land Use (agriculture-soil carbon), N₂O abatement at our chemical fertilizer production plants, and even direct carbon capture. The fund can be used to explore the potential of WA for permanent underground storage. This NWIW VMP fund will provide key investments in WA, providing the infrastructure for a low carbon future.

Are there Enough Carbon Credits for NWIW to fulfill their mission?

A million or more carbon credits a year is a tall order. The the world-wide voluntary carbon markets can support this added demand. It will be welcomed! There will be sufficient funds annually to make the purchase, with money left over for new and ongoing carbon project development.

Recently a large tranche of carbon credits came on the market from a PNW forest project. The project, owned by the Nature Conservancy of Canada, located in B.C. just over the WA State boarder, has 1.38 recently put 1.4 million carbon credits in the marketplace. Multiple years of this project was verified together creating a large supply of credits from a great forest project. The project preserves biodiversity, with habitat for several threatened species. The whole tranche will likely be sold this year, the price is reasonable and is an example of a single carbon project that has generated sufficient credits to support a year's + mitigation under the VMP. This project would be well within the NWIW yearly budget and the

have significant funds left over for new investments. NWIW will have to make use of U.S. based, and worldwide carbon markets and continue to be on the lookout for good carbon projects. Carbon credits can be purchased and held, then retired when needed. NWIW will have to manage this fund full-time, keeping abreast of carbon credits coming into the marketplace, and finding new carbon project development opportunities to assure a local supply of carbon credits to supplement credits purchased from projects elsewhere in the PNW, the U.S. and world-wide.

Conclusion

GHG mitigation under the VMP will be possible. NWIW will have to be pro-active and be a player in the PNW carbon marketplace, nationally, and internationally. One million+ annual credits is a tall order, but an achievable one. The amount of the NWIW fund for the VMP will be more than sufficient to achieve this annual goal through the voluntary carbon marketplace. The funds invested into local, national and international carbon markets will be welcomed by project developers, fostering strong relationships with well managed carbon projects. This large fund will allow NWIW to be a competitive buyer, providing new energy and economic stimulus into the growing carbon markets. NWIW will have to engage in an ongoing program of due diligence of existing and new carbon projects. Criteria will have to be set up to confirm that the carbon credits purchased are of high quality and providing additional co-benefits (environmental, social, economic, and direct community benefits).

Attn: Rich Doenges
SEPA Responsible Official
Washington Department of Ecology
PO Box 47775
Olympia, WA 98504-7775

Dear Mr. Doenges,

I am a chemical engineer with 36 years of petrochemical industry experience, the last 24 of which I have worked as an independent analyst of global methanol markets. In 2004, I founded Methanol Market Services Asia (MMSA), a global consulting firm which provides business solutions to most major methanol manufacturers, consumers, traders, distributors, and other associated companies. MMSA was founded and remains headquartered in Singapore. Among its services, MMSA provides detailed analysis of Chinese methanol markets, including methanol demand and trade flows. In the course of my work with MMSA, I have traveled extensively to China to visit clients to understand how methanol is consumed and transacted in China. MMSA has permanent, Mandarin speaking staff in China also with extensive methanol market experience. I am in frequent contact with Chinese methanol market participants and regularly prepare independent reports on Chinese methanol markets.

I was engaged by the Port of Kalama (Port) to objectively review and comment on the State of Washington Department of Ecology's (Ecology's) Draft Second Supplemental Environmental Impact Statement (DSSEIS) prepared for a proposed Kalama Manufacturing and Marine Export Facility (KMMEF) and provide my opinions about the reasonableness of assumptions used in the report regarding behavior of methanol markets in China. Specifically, I was asked to comment on methanol market related assumptions used in the Emissions Sensitivity Model (ESM) developed by the report authors.

I affirm my genuine belief in the opinions expressed in this report. In submitting this report, I acknowledge my independence from the Port and their legal representatives. My engagement with the Port was not conditioned upon the arrival of a certain conclusion.

In summary, I identified several assumptions that would lead to an overstatement of the GHG impact of the KMMEF, and an understatement of the net emissions benefits of KMMEF. Specifically:

- A reference case assumption that 40 percent of the KMMEF would be used for fuels use in China
 - For several reasons, including current gasoline specifications, the current market locations of methanol's use as fuel, and the costs of transporting imported methanol for use in fuel applications, the assumption of 40 percent is too high.
 - Notably, the authors did not use MMSA China data in their analysis, instead

misinterpreting global-level MMSA information in a manner which overstates the potential for, and the impact of, displacing existing fuels use with methanol in China.

- A reference case assumption that KMMEF produced methanol would displace 60 percent of methanol produced by a coal-based methanol production process, 10 percent by a Chinese natural gas-based process, and 30 percent from imported methanol.
 - The choice of 60 percent is too low and is based on a methodology that is not clearly explained in the DSSEIS.

Following are details behind the findings above and suggestions for more appropriate assumptions for ESM reference case inputs.

Use of KMMEF methanol as fuel in China will be negligible

The use of methanol imported from overseas by Chinese parties as “fuel,” including, as the DSSEIS posits, use of the methanol made at the KMMEF, is and will be negligible. While there is appreciable use of methanol in China for fuel that MMSA categorizes as “gasoline blending and combustion,” “biodiesel,” “dimethyl ether,” and “methyl tert-butyl ether (MTBE),” these uses (which can all be considered fuel), are almost entirely supplied by domestically produced methanol. In fact, despite the large current size of imports into China, MMSA observes that essentially no overseas methanol is directly blended with gasoline, nor used in industrial boilers, nor used in cooking or heating applications in China. Assuming (as the DSSEIS did) that 40% of KMMEF’s annual methanol production (1.4 million metric tons per year) would be used as fuel would require a Chinese methanol fuel demand many magnitudes higher than the existing market for overseas methanol demand into fuels (less than 30 thousand metric tons per year).

There are several reasons which drive and will continue to drive this market behavior in which methanol supply from overseas will not be used in fuel on any large scale. For one, Chinese authorities, in conjunction with state-owned refiners, are discouraging the use of methanol as a transportation fuel, especially in large consuming areas. The majority of gasoline consumed in China is in major urban areas near the coast, and current national gasoline specifications (attached) have strict limitations on methanol use (maximum 0.3 percent by weight). These specifications were developed by refiners who are not convinced of the overall benefits of methanol gasoline blends, including the incremental costs associated with preparing and handling such blends, as well as the lack of broad automotive industry support for methanol. As a result, there is no readily accessible market for methanol in coastal China (where most gasoline is consumed, and near the location where methanol imports from overseas arrive).

Chinese use of methanol in gasoline blends is highly fragmented, limited to inland provinces with high coal resources where gasoline supply had been limited, and transportation fuels are needed. In these regions, locally produced methanol is typically blended with gasoline in blends from 5 to 30 percent (M5 to M30), with M15 being the most common type. Note that, these domestic blenders are under pressure to close operations. Nationally there is clear intention by government officials, including the National Development and Reform Commission (NDRC) and the Ministry of Industry and Information Technology (MIIT) to limit the use of methanol in low-level blends with gasoline, and instead use M100, or pure methanol in transportation uses. These pilot programs are limited in size, restricted to a few

thousand vehicles, are one of several alternative fueled vehicle experiments in China, and there is no guarantee of success in wider development. However, it should be noted that the motivation for this use is driven by having a superior fuel in several ways including GHG and other emissions improvements over conventional fuels. Because methanol and gasoline blends are not encouraged nationally, MMSA forecasts only modest growth in use of methanol in gasoline blends in China, and very modest growth of M100 use from an exceedingly small base of consumption. Note also that MMSA observes that the total amount of methanol used today as M100 is less than 20,000 metric tons per year (one day's output at the KMMEF).

Another factor which prevents overseas methanol from being used in gasoline blending is cost. The cost of shipping imported methanol from coastal ports inland via barge, rail, or truck is high. Costs to deliver methanol to these locations will make overseas methanol uncompetitive for these remote, and relatively small, markets. For instance, assume that methanol is delivered to coastal China at the current import market price of USD 230 per metric ton. The importer would then pay a duty of USD 12.65 per metric ton to import the product, then pay roughly USD 10 per metric ton to store and transfer the methanol to a delivery vessel (which for transport to provinces requiring methanol for gasoline blending, industrial boilers, and/or heating and cooking and other fuel uses would likely be a rail car). Rail costs would of course vary by province, and a typical rail cost would be USD 40 per metric ton. Whoever would sell such methanol would need to at minimum absorb these costs, and the consumer would pay a 13 percent Value Added Tax (VAT) on top of that. Accordingly, such a parcel of methanol delivered inland for use would be USD 292.65 before VAT and USD 330.69. The current domestic market price for methanol in inland provinces after VAT is CNY 1750, or approximately USD 258 per metric ton. There is no premium for imported methanol for inland province consumption. Thus, there is no chance that a sale of methanol product at USD 330.69 could be made in any substantial quantities in inland provinces for any use, let alone fuels uses. Methanol overwhelmingly substitutes for uses in coastal markets, not inland markets, which are where the majority of methanol for fuels uses resides. Thus, it is highly difficult to have imported methanol used in fuels markets in China.

In summary, because there is little overseas use of methanol in fuel applications in China, the DSSEIS reference case (and highest probability assumption) that 40 percent of KMMEF methanol would be used for fuels in China is highly overstated. The DSSEIS should utilize a reference case assumption for its EMS that 98 percent of the KMMEF methanol would displace olefins, and 2 percent would displace fuel. However, as the current ESM only allows assumptions to be inputted in 10 percent increments, I would suggest that the DSSEIS would utilize a reference case assumption for its EMS that 100 percent of the KMMEF methanol would displace olefins, and 0 percent would displace fuel.

KMMEF displacement of methanol used in China

The cost curve of methanol supply to coastal China (below) provides a useful method to determine which facilities would be most cost competitive. The curve (blue line) is shown in the following chart, "MeOH Delivered Cash Cost – September 2020E." The curve is assembled by calculating the costs to produce and deliver methanol to coastal China at a given point in time, factoring feedstock, variable, fixed, and freight costs among others, from all available locations around the world (noting that not every location chooses to supply China at a given point in time). These costs are sorted from lowest to highest, and then plotted against their

cumulative ability to supply coastal China. This chart is updated monthly by MMSA in its analysis of Chinese methanol markets.

In the chart, the blue line is a useful indicator to predict behavior of suppliers of methanol to coastal China, especially when compared to the horizontal orange and green lines shown. These horizontal lines represent the price at which methanol is sold. Producers whose costs to produce a ton of methanol exceed market prices (currently USD 240 – 250 per metric ton) will be selling at a loss and will very often shut down operations (“shut in”) soon thereafter. These are called “high cost producers,” and on this curve are almost exclusively coal and coke-oven gas-based supply and reside in the upper right-hand side of the curve. [Details behind each point on the cost curve can be made available by MMSA.] These high cost facilities will stop producing when prices collapse below their cost to supply material to avoid loss of profit. Overseas suppliers, including KMMEF, are in lower left-hand side of curve. These “low cost suppliers” are able to sell methanol at a profit. As they produce, they “push” the high cost methanol producers to the upper right-hand side of the cost curve, relegating them to negative profits and obsolescence. For reference, I have included a horizontal line (orange) where MMSA estimates the cost of delivery of methanol from KMMEF using current natural gas, duty, and freight estimates. KMMEF would be able to transport and sell methanol in coastal China at a more competitive cost than coal-based production (every point on the blue curve to the right of where the orange and blue lines intersect). Were KMMEF operational at designed capacity, and on this curve, it would move 3.6 million metric tons of coal based methanol production to the right of the curve, and expose that same 3.6 million metric tons to a point where they were higher on the curve than current pricing (green line). In this manner, overseas suppliers will force the closing of operations of high cost, coal-based production: by supplying market needs at lower costs.

An example of how Chinese production slows as described by the cost curve is shown in the following chart, “E, S China Methanol Aggregate Operation Rate vs Margin.” In the chart, historic operation rates are compared to the cash margin of production (price minus cost to

produce) for high cost coal based methanol producers during a recent price turndown in China as the COVID-19 crisis impacted the country's economy, and then subsided. Operation rates are tracked by MMSA weekly and shown as the blue line in the chart. Cash margins are also calculated by MMSA weekly and compared in the green line in the chart. As cash margins became negative the coal to methanol facilities reduced production or shut off, leading to the lowered operating rates (as illustrated where the blue line drops from high levels of late March – early April 2020 to a near-halving of production by late June). As margins improved above zero, operating rates recovered.

E, S China Methanol Aggregate Operation Rate vs Margin

Recall that these high cost producers which have shut in reside on the right-hand side of the cost curve. Considering this data, it is very likely that KMMEF, which will be on the left-hand side of the cost curve, will have the effect of displacing high cost coal to methanol supply in China, moving the marginal supply costs down, lowering cash margins for high cost producers, which will then shut down.

Another example showing how the MMSA cost curve describes market behavior in China can be gleaned from China import data. The chart "China Methanol Demand, Imports," compiles historic and forecast MMSA records of Chinese methanol demand and imports. Essentially all the imports into China come from supplies on the lower left-hand side of the cost curve, i.e. low cost overseas supply, like that of KMMEF. These supplies have garnered an increasing share of the methanol needed in China. This behavior underscores the trend in China toward use of methanol supplies like KMMEF.

Imports from low cost overseas imports have increased in 2020 at the cost of high cost production in China and have contributed to the lower operation rates. KMMEF would be one of these low cost methanol suppliers, and will be able to place product into China, not at the expense of the low cost overseas suppliers, but in conjunction with them, at the expense

of the high cost Chinese coal based methanol production.

In conclusion, KMMEF will push high cost capacity to the right of the cost curve. High cost capacity in China is coal based and will be first to shut down. Imports from low cost overseas supply will not suffer; it will displace high cost coal-based capacity in China. Accordingly, the “high coal case (80/20)” used in the EMS is not only more probable than reference case, it is my opinion that the most probable case (and so most appropriately applied in the DSSEIS’s reference case) will be 100% displacement of coal derived methanol and a 0% replacement of gas-based methanol production.

Importantly, Chinese entities are planning to expand domestic coal-based production in the future. MMSA tracks the most likely projects (with many more under planning) for Chinese methanol production. These are listed in the following table.

The table is important in considering the impact of the KMMEF and similar facilities on coal-

		METHANOL													
		Average Annual Capacities (-000- METRIC TONS) - New Facilities from 2019

based production in China. Notably:

- Between 2019 and 2025E, MMSA estimates that over 18 million metric tons of new coal based methanol production capacity could issue.
- These are all coal-based facilities and will make methanol at higher costs than landed KMMEF costs.
- They are being built due to the growing use of methanol in China and the lack of low cost, gas-based supplies from overseas.
- Many of these facilities are still in planning and have not been built yet, and may be delayed or cancelled with projects like KMMEF
- In fact, companies like Sinopec have been actively seeking overseas natural gas base methanol supply as they would prefer this more cost-effective source of methanol

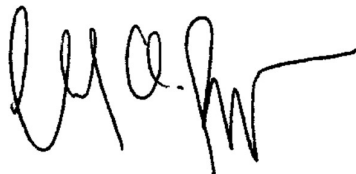

Thus, projects like the KMMEF will not only displace current production of methanol from coal, they will continue to do so in future years.

Based on my findings, the ESM assumptions for the reference and most probable case should be:

- 100 percent of the KMMEF methanol will be used for olefins, and zero percent for fuel
- 100 percent substituting Chinese coal-based methanol and zero Chinese natural gas based and other imports.

When I used the suggested assumptions as the reference case in the ESM provided, I found that the net global GHG emission reduction was significantly higher than reflected in the DSSEIS.

Sincerely,

Mark Berggren
Managing Director
Methanol Market Services Asia Pte. Ltd. (MMSA)

车 用 汽 油

Gasoline for motor vehicles

2016-12-23 发布

2016-12-23 实施

中华人民共和国国家质量监督检验检疫总局 发布
中国国家标准化管理委员会

前 言

本标准的全部技术内容为强制性。

本标准按照 GB/T 1.1—2009 给出的规则起草。

本标准代替 GB 17930—2013《车用汽油》。

本标准与 GB 17930—2013 相比,主要技术变化如下:

- 将第 1 章“范围”的第二段由“本标准适用于由液体烃类或由液体烃类及改善使用性能的添加剂组成的车用汽油”,修改为:“本标准适用于点燃式发动机使用的、由石油制取或由石油制取的加有改善性能添加剂的车用汽油”(见第 1 章,2013 版的第 1 章);
- 删除了车用汽油(Ⅲ)的技术要求和试验方法(见 2013 版表 1),增加了第 VI 阶段车用汽油的技术要求,并依烯烃含量的不同分为 VI A 阶段和 VI B 阶段(见表 3、表 4);
- 在蒸气压的要求中增加了“换季时,加油站允许有 15 天的置换期”(见表 1、表 2、表 3、表 4、表 A.1 和表 A.2,2013 版表 2、表 3 和表 A.1);
- 修改了车用汽油(V)硫醇硫含量的技术要求(见表 2 和表 A.1,2013 版表 3 和表 A.1);
- 删除广西地区全年执行夏季蒸气压的要求,因为广西地区为车用乙醇汽油的实施区域(见表 2、表 3、表 4、表 A.1 和表 A.2,2013 版表 3 和表 A.1);
- 修改了第 9 章“标准的实施”(见第 9 章,2013 版的第 9 章);
- 增加了表 A.2(见表 A.2)。

本标准由国家能源局提出。

本标准由全国石油产品和润滑剂标准化技术委员会石油燃料和润滑剂分技术委员会(SAC/TC 280/SC 1)归口。

本标准起草单位:中国石油化工股份有限公司石油化工科学研究院、中国石油天然气股份有限公司炼油与化工分公司、中国石油天然气股份有限公司石油化工研究院、中海石油炼化有限责任公司、中国汽车研究中心。

本标准主要起草人:倪蓓、龙军、李文乐、张建荣、张彦、张国相、郭莘、郭红松、刘倩。

本标准所代替标准的历次版本发布情况为:

- GB 17930—1999、GB 17930—2006、GB 17930—2011、GB 17930—2013。

车 用 汽 油

警告:如果不遵守适当的防范措施,本标准所属产品在生产、运输、装卸、贮运和使用等过程中可能存在危险。本标准无意对与本产品有关的所有安全问题提出建议。使用者有责任采用适当的安全和防范措施,并保证符合国家有关法规规定的条件。

1 范围

本标准规定了车用汽油的术语和定义、产品分类、要求和试验方法、取样、标志、包装、运输和贮存、安全及标准的实施。

本标准适用于点燃式发动机使用的、由石油制取或由石油制取的加有改善使用性能添加剂的车用汽油。

3 术语和定义

下列术语和定义适用于本文件。

3.1

抗爆指数 antiknock index

研究法辛烷值(RON)和马达法辛烷值(MON)之和的二分之一。

4 产品分类

车用汽油(Ⅳ)按研究法辛烷值分为 90 号、93 号和 97 号 3 个牌号,车用汽油(Ⅴ)、车用汽油(ⅥA)和车用汽油(ⅥB)按研究法辛烷值分为 89 号、92 号、95 号和 98 号 4 个牌号。

5 要求和试验方法

5.1 车用汽油中所使用的添加剂应无公认的有害作用,并按推荐的适宜用量使用。车用汽油中不应含有任何可导致车辆无法正常运行的添加物和污染物。车用汽油中不得人为加入甲缩醛、苯胺类、卤素以及含磷、含硅等化合物。

5.2 车用汽油(Ⅳ)的技术要求和试验方法见表 1。

5.3 89 号、92 号和 95 号车用汽油(Ⅴ)的技术要求和试验方法见表 2。企业有条件生产和销售 98 号车用汽油(Ⅴ)时,其技术要求应符合表 A.1。

5.4 89 号、92 号和 95 号车用汽油(ⅥA)和车用汽油(ⅥB)的技术要求和试验方法分别见表 3 和表 4。企业有条件生产和销售 98 号车用汽油(ⅥA)/(ⅥB)时,其技术要求应符合表 A.2。

^d 将试样注入 100 mL 玻璃量筒中观察,应当透明,没有悬浮和沉降的机械杂质和水分。在有异议时,以 GB/T 511 和 GB/T 260 方法为准。					
^e 也可采用 SH/T 0693 进行测定,在有异议时,以 SH/T 0713 方法为准。					
^f 对于 97 号车用汽油,在烯烃、芳烃总含量控制不变的前提下,可允许芳烃的最大值为 42％(体积分数)。也可采用 NB/SH/T 0741 进行测定,在有异议时,以 GB/T 11132 方法为准。					
^g 也可采用 SH/T 0720 进行测定,在有异议时,以 NB/SH/T 0663 方法为准。					
^h 锰含量是指汽油中以甲基环戊二烯三羰基锰形式存在的总锰含量,不得加入其他类型的含锰添加剂。					

表 2 车用汽油(V)技术要求和试验方法

项目		质量指标			试验方法
		89	92	95	
抗爆性：					
研究法辛烷值(RON)	不小于	89	92	95	GB/T 5487
抗爆指数(RON+MON)/2	不小于	84	87	90	GB/T 503、GB/T 5487
铅含量 ^a /(g/L)	不大于	0.005			GB/T 8020
馏程：					GB/T 6536
10％蒸发温度/℃	不高于	70			
50％蒸发温度/℃	不高于	120			
90％蒸发温度/℃	不高于	190			
终馏点/℃	不高于	205			
残留量(体积分数)/％	不大于	2			
蒸气压 ^b /kPa：					GB/T 8017
11月1日～4月30日		45～85			
5月1日～10月31日		40～65 ^c			
胶质含量/(mg/100 mL)：					GB/T 8019
未洗胶质含量(加入清净剂前)	不大于	30			
溶剂洗胶质含量	不大于	5			
诱导期/min	不小于	480			GB/T 8018
硫含量 ^d /(mg/kg)	不大于	10			SH/T 0689
硫醇(博士试验)		通过			NB/SH/T 0174
铜片腐蚀(50℃,3 h)/级	不大于	1			GB/T 5096
水溶性酸或碱		无			GB/T 259
机械杂质及水分		无			目测 ^e
苯含量 ^f (体积分数)/％	不大于	1.0			SH/T 0713
芳烃含量 ^g (体积分数)/％	不大于	40			GB/T 11132
烯烃含量 ^g (体积分数)/％	不大于	24			GB/T 11132
氧含量 ^h (质量分数)/％	不大于	2.7			NB/SH/T 0663
甲醇含量 ^a (质量分数)/％	不大于	0.3			NB/SH/T 0663
锰含量 ^a /(g/L)	不大于	0.002			SH/T 0711
铁含量 ^a /(g/L)	不大于	0.01			SH/T 0712
密度 ⁱ (20℃)/(kg/m ³)		720～775			GB/T 1884、GB/T 1885
^a 车用汽油中,不得人为加入甲醇以及含铅、含铁和含锰的添加剂。					
^b 也可采用 SH/T 0794 进行测定,在有异议时,以 GB/T 8017 方法为准。换季时,加油站允许有 15 天的置换期。					
^c 广东、海南全年执行此项要求。					
^d 也可采用 GB/T 11140、SH/T 0253、ASTM D7039 进行测定,在有异议时,以 SH/T 0689 方法为准。					
^e 将试样注入 100 mL 玻璃量筒中观察,应当透明,没有悬浮和沉降的机械杂质和水分。在有异议时,以 GB/T 511 和 GB/T 260 方法为准。					
^f 也可采用 GB/T 28768、GB/T 30519 和 SH/T 0693 进行测定,在有异议时,以 SH/T 0713 方法为准。					
^g 对于 95 号车用汽油,在烯烃、芳烃总含量控制不变的前提下,可允许芳烃的最大值为 42％(体积分数)也可采用 GB/T 28768、GB/T 30519、NB/SH/T 0741 进行测定,在有异议时,以 GB/T 11132 方法为准。					
^h 也可采用 SH/T 0720 进行测定,在有异议时,以 NB/SH/T 0663 方法为准。					
ⁱ 也可采用 SH/T 0604 进行测定,在有异议时,以 GB/T 1884、GB/T 1885 方法为准。					

表 3 车用汽油(VIA)技术要求和试验方法

项目		质量指标			试验方法
		89	92	95	
抗爆性：					
研究法辛烷值(RON)	不小于	89	92	95	GB/T 5487
抗爆指数(RON+MON)/2	不小于	84	87	90	GB/T 503、GB/T 5487

</div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </div><div> </</div></div></div>					

6 取样

取样按 GB/T 4756 进行,取 4 L 作为检验和留样用。若车用汽油中含锰,取样时应避光。

7 标志、包装、运输和贮存

7.1 向用户销售的符合本标准要求的车用汽油所使用的加油机都应明确标示产品的名称、牌号和等级(Ⅳ、Ⅴ、ⅥA 和 ⅥB)。如:“89 号汽油(Ⅴ)”“92 号汽油(Ⅴ)”“95 号汽油(Ⅴ)”等,并应标识在消费者可以看见的地方。

7.2 车用汽油属易燃液体,产品的标志、包装、运输和贮存及交货验收按 SH 0164、GB 30000.7—2013 和 GB 190 进行。

8 安全

车用汽油属易燃液体,其危险说明和防范说明见 GB 30000.7—2013 中附录 D。

9 标准的实施

本标准自发布之日起在全国范围内实施,并实行逐步引入的过渡期要求。表 2 和表 A.1 规定的技术要求过渡期至 2016 年 12 月 31 日,自 2017 年 1 月 1 日起,表 1 规定的技术要求废止;表 3 和表 A.2 规定的技术要求过渡期至 2018 年 12 月 31 日,自 2019 年 1 月 1 日起,表 2 和表 A.1 规定的技术要求废止;表 4 规定的技术要求过渡期至 2022 年 12 月 31 日,自 2023 年 1 月 1 日起,表 3 规定的技术要求废止。

考虑到国内某些地区环保的特殊需求,各地方政府可依据其环保治理要求,与相关油品供应部门协商一致后,可提前实施相应阶段的车用汽油技术要求。

附 录 A
(规范性附录)

98 号车用汽油的技术要求和试验方法

98 号车用汽油(V)的技术要求和试验方法见表 A.1。98 号车用汽油(VIA)/(VIB)的技术要求和试验方法见表 A.2。

RE: Comments on the Kalama Manufacturing and Marine Export Facility
Draft Second Supplemental Environmental Impact Statement Ecology Publication 20-06-011

Mr. Doenges,

Northwest Innovation Works ("NWIW") appreciates the opportunity to comment on the Department of Ecology's ("Ecology") Draft Second Supplemental Environmental Impact Statement ("Draft SSEIS") for the Kalama Manufacturing and Marine Export Facility ("KMMEF" or "Project"). NWIW recognizes the effort Ecology has devoted to evaluating the potential greenhouse gas ("GHG")-related impacts associated with construction and operation of the KMMEF and provides these comments to clarify aspects of the Project and highlight the climate benefits that will be realized through the application of the proposed clean technology.

A cornerstone of this Project is NWIW's mission "to produce the world's cleanest methanol in order to make everyday materials a part of the global climate solution." In furtherance of this goal, NWIW has committed to installing advanced, innovative technology to produce methanol for materials manufacturing. The methanol produced using NWIW's proposed clean technology will replace methanol produced overseas using dirtier, less efficient means, resulting in a global *reduction* in GHG emissions. Ecology has acknowledged these efforts in its Draft SSEIS¹ and similarly concluded that "emissions from the [Project] will always be lower than emissions from other substitute methanol pathways."² In other words, Ecology's analysis found that "the [Project] would slow the global increase in emissions arising from methanol production and use."³

¹ See Draft SSEIS at p. 46 ("The KMMEF facility is projected to have a lower direct GHG emission rate than current methanol importers to China. This is due to KMMEF's innovative ULE technology....").

² Draft SSEIS at p. 86 (Section 3.5.5-- Net Global Emissions).

³ *Id.* at p. 105.

The net decrease in global GHG emissions resulting from operation of the innovative KMMEF will be felt globally, which is the meaningful measure for purposes of addressing and mitigating global climate change:

Greenhouse gases, once emitted from a specific source, quickly mix and disperse in the global atmosphere and have a long atmospheric lifetime. Current research on how greenhouse gases influence global climate change has focused on the cumulative environmental effects from aggregate regional or global sources. But there is limited scientific capability in assessing, detecting, or measuring the relationship between a certain GHG emission source and localized climate impacts in a given region.

Wash. Env'tl. Council v. Bellon, 732 F.3d 1131, 1143 (9th Cir. 2013).

The KMMEF will result in a significant global reduction of GHG emissions over the current global course. However, it is important to recognize, in spite of that substantial global benefit, if you draw an emissions “box” around Washington State, the KMMEF will generate new direct and indirect in-state GHG emissions. Importantly, Ecology concluded that the in-state GHG emissions from the Project, while categorized as significant, are capable of mitigation.⁴

To address the in-state emissions, NWIW has proposed a Voluntary Mitigation Program Framework (“VMPF”) to mitigate 100% of the direct and indirect in-state GHG emissions generated by this Project. This mitigation is *in addition to* the net global reduction in GHG emissions that will be realized from this Project.

Under the VMPF, NWIW will annually calculate and report direct and indirect GHG emission from the KMMEF to Ecology. NWIW will use GHG calculation methods established in Ecology’s GHG Reporting Rule at WAC ch. 173-44. Ecology will then review and verify all GHG emissions calculations submitted by NWIW. Robust regulatory oversight is established to ensure accurate quantification of annual Project direct and indirect emissions.

The VMPF also establishes a robust process for developing and selecting mitigation projects to offset 100% of the in-state GHG emissions from the Project. An independent VMP Board comprised of environmental, business, and community stakeholders will identify and nominate cost-effective GHG mitigation projects, and award and disperse funding for projects or, where necessary, the purchase of carbon credits. To be clear, Ecology and Cowlitz County will review the mitigation opportunities recommended by the VMP Board and, ultimately, verify whether they satisfy the requisite criteria outlined in the VMPF and whether they achieve the annual VMP emissions obligations.

⁴ Draft SSEIS at pp. 25, 105-106.

The intent of the VMPF is to establish a solid procedure for identifying worthy mitigation projects with meaningful input from community stakeholders. Indeed, it would be more straightforward to simply commit to purchasing carbon credits to offset annual emissions. However, NWIW would prefer to direct its mitigation investment in a way that prioritizes more immediate in-state or regional improvements, and, over time, serve to develop and grow a robust regional carbon offset marketplace and growing portfolio of emission reduction projects. Identifying effectual mitigation projects that meet the criteria outlined in the VMPF will take time and community and agency engagement. The approach adopted in the VMPF not only makes sense from a practical standpoint, but it is also consistent with the obligations under SEPA related to the level of specificity that is appropriate at the proposal state of a project when the EIS is prepared.⁵

In mitigating its direct and indirect GHG emissions, NWIW is joining other Washington companies in their corporate climate leadership. Microsoft, Amazon and Starbucks have all made significant carbon mitigation pledges and have been identified by Sightline Institute as national leaders.⁶ These companies are implementing voluntary mitigation programs similar to NWIW's VMPF, using a combination of emission reduction projects and offset purchases.

The emission profile scale of Microsoft (4.1 million MTCO₂e/year⁷) and Amazon (11.2 million MTCO₂e/year⁸) suggest that NWIW's commitment to mitigate between 786K and 1.4 million MTCO₂e/year⁹ is both feasible and achievable. In fact, NWIW's mitigation plan goes one step further in accountability, by including regulatory oversight from Cowlitz County and the Department of Ecology. As described above, under the VMPF, Ecology not only verifies the annual GHG emissions obligation for NWIW, but also has final approval of the VMP Board's recommendations regarding the proposed mitigation projects.

NWIW appreciates the breadth and depth of analysis undertaken to reach Ecology's key conclusions in the Draft SSEIS. In that light, there are only three points NWIW offers as warranting further clarification in the final SSEIS:

- 1) The VMPF is an acceptable mechanism for mitigating in-state GHG emissions from the Project.** During preparation of the Draft SSEIS, Ecology carefully reviewed the VMPF and offered revisions to strengthen the reporting requirements, and new criteria to ensure one-

⁵ See e.g., *City of Des Moines v. Puget Sound Reg'l Council*, 97 Wn. App. 920, 928, 988 P.2d 993, 998 (1999) (A "dire prediction that mitigation will never be undertaken because it has not been specifically imposed...is unfounded.").

⁶ https://www.sightline.org/2020/09/21/how-cascadian-corporations-stack-up-on-climate/?utm_source=Sightline%20Institute&utm_medium=web-email&utm_campaign=Sightline%20News%20Selections

⁷ *Id.*

⁸ *Id.*

⁹ Draft SSEIS at p. 85.

to-one emissions mitigation, which were incorporated into the VMPPF.¹⁰ Ecology also describes the VMPPF in detail and includes it as an appendix to the Draft SSEIS.¹¹ NWIW requests that Ecology confirm in its final SSEIS that the VMPPF is an effective and appropriate vehicle for achieving mitigation of in-state GHG emissions from the Project.

- 2) **With NWIW mitigating 100% of in-state GHG emissions, along with global GHG benefits, the GHG-related impacts from the Project will be reduced to a nonsignificant level.** Since the Project will result in avoided global GHG emissions, as “the [Project] would slow the global increase in emissions arising from methanol production and use,”¹² and NWIW will mitigate 100% of the in-state GHG emissions, the Project as implemented will have minimal GHG-related impacts. This is a foundational component of the Project, and NWIW requests that Ecology confirm in the final SSEIS that mitigation measures are identified that will reduce the identified adverse impacts to a nonsignificant level.
- 3) **KMMEF methanol is not going to be used as a fuel.** NWIW is developing a cleaner process for producing methanol to be used in materials manufacturing, a critical improvement over the existing methanol feedstock produced overseas using less efficient, dirtier processes. NWIW is committed to this materials pathway limitation, and is in fact prohibited through its Dock Usage Agreement (see Appendix E to the SEIS) from producing methanol that will be used as a fuel source. While Ecology conservatively analyzes the impacts of KMMEF methanol being combusted as a fuel in its Draft SSEIS, NWIW requests that Ecology clarify that this analysis is purely a conservative assumption and modeling conclusion addressing methanol market inputs, and that this scenario is neither consistent with the purpose or intent of this Project nor does it assert or imply that NWIW will pursue or enable such transactions.

Thank you again for the opportunity to review and comment on the Draft SSEIS. NWIW remains available to Ecology staff and your consulting team as necessary to continue the robust and collaborative process undertaken by Ecology through this SSEIS production.

Sincerely,

Kent Caputo
General Counsel

Justas Vilgalys

I oppose moving forward with the Kalama Manufacturing and Marine Export Facility. Burning fossil fuels is bad for the environment. Burning fossil fuels is the major contributor to human caused climate change. this in turn is leading to mass extinction of plants and animals. Washington State, and Kalama should not invest in any plants that will be enable burning more fossil fuels. Instead, I urge Kalama to invest in clean, reusable energy.

Leslie McClure

If we are smart, we will be building all new sustainable infrastructure in the next ten years. Going green will bring jobs and save us from climate change.

To start a new fossil fuels project now is ridiculous, wasteful, and damaging.

The claim that natural gas is a bridge fuel is old now plus we now know that methane is as dangerous as CO₂ for our environment.

Also, Covid has shown us what happens when we go where we don't belong and compromise other animals. As we search for more fossil fuel, we displace more animals and enter places that carry viruses unlike any that we've seen.

Elizabeth Madrigal

My comments are in brackets, [], based on your Preliminary Report Findings.

* The project would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year. [Why would we allow this when we have so many non-polluting energy options?]

* The Kalama facility would be one of the 10 largest sources of greenhouse gas emissions in the state. Northwest Innovation Works has said that it will mitigate all of the facility's in-state emissions. [I do not "trust" them to keep their word. Forgive me, but corporate promises don't mean much to me since 1993, when the Pacific Wood Treating Company went bankrupt and left a superfund site in Ridgefield, Wash., where I live. After a 20 year citizen-paid clean-up, they are still finding contaminants in the lawns of people within blocks of the site.]

* Worldwide demand for methanol is likely to increase in the decades ahead, leading to higher greenhouse gas emissions with or without the Kalama facility. [Now this is the worst argument "for" I can possibly imagine. Like a kid saying, "Yes, I stole the car because the keys were in the ignition and the doors were unlocked because somebody was going to steal it."]

* It would lead to methanol being burned as a fuel. Northwest Innovation Works has said all of the methanol from the Kalama facility will be used in plastics production, but increasing methanol supply makes it more likely that more methanol will be used as fuel, regardless of the source. [There are alternate fuels that do not pollute. Why is this concept so difficult? Why would we approve something we know pollutes?]

* Extracting and transporting the natural gas used to make the methanol could produce higher emissions than previous estimates. [This is not a surprise. It is more discouraging as it reflects on the truthfulness of the original estimates.]

* Methanol made in Kalama could produce lower greenhouse gas emissions than many competing methanol supplies, from coal or less efficient natural gas sources. [With a new green deal, methanol will be phased out. If we create more manufacturing facilities, that phase out will take 100 years the planet cannot afford.]

* This means that global greenhouse gas emissions would increase with the addition of the Kalama facility, but likely less than they might if that demand was met by other sources. [This is a false choice. We do not need to choose between less evil and more evil when we have alternative sources of energy and fuel that do not pollute.]

randall potts

I strongly object to the Kalama Manufacturing and Marine Export Facility. This project is on the wrong side of science in two important respects. First, we are literally drowning in plastic and micro-plastic which has infiltrated our food chain, our water, our land, our air and our bodies. Scientists have repeatedly warned us that the only way to deal with plastic pollution is to stop manufacturing it. Further, it doesn't matter where the plastic is manufactured or disposed of or "recycled," because this is a global problem and the plastic degrades in such a way that it affects all of us. I might add, that ethically, it is unsound to export a product that is known to create health problems in wildlife, the land and marine environment, and even the air while posing a danger to human health.

Secondly, the science tells us that burning natural gas or worse methanol creates more greenhouse gasses that increase the pace of climate change. Again, this is a global problem, so where the gas is burned is not the issue, burning it will endanger us all.

Lastly, I would note that the transportation, manufacturing, storage, and shipping associated with operating a natural gas-to-methanol production plant and storage facilities on approximately 90 acres at the Port of Kalama will have negative environment and health consequences for residents, wildlife and marine life near the plant. This is not a responsible way to treat the people, the land and the water or wildlife of all kinds. These consequences may extend far beyond the immediate area of the plant, carried by air and water. There are also health and environmental degradation that will occur because of increased shipping.

In conclusion, this is an unnecessary project that has negative consequences for health and the environment throughout the proposed process, from the point of production to the point of use. It is a dangerous project that puts profits before people, wildlife and the environment. It is a project that science tells us is dangerous and to suggest otherwise is to choose to ignore the abundant scientific data. Finally, it is an unethical and wasteful project that endangers and disregards the data-driven consequences it will have and chooses to instead prop up the obsolete fossil fuel industry. Ultimately, it will be cost more than it is worth and the profits it creates will decline over time and are small compared to the damage it will create and any efforts to clean up that damage. It is a bad project and I implore you not to permit it to move forward.

PETER ISAACSON

MY FAMILY IS WELL AWARE OF THIS WONDERFUL PROJECT... WE STAND
BEHIND IT 100%. WE ARE WELL AWARE OF THE BENEFITS AND MINIMAL RISKS.
WE WILL MAKE SURE THEY ARE GOOD NEIGHBORS.

PETER ISAACSON & FAMILY
LONGVIEW, WA

Karen Long

1 We should be lessening, not adding to our pollution load.

2 Let China make their own methanol.

3 We should be looking at a reduction in plastics production, not an increase...especially given that we can't even effectively recycle what already exists.

4 Surely there is some industry we could foster in the same location for economic gain which would support a more eco-intelligent process/ product. If Washington does not lead this country towards that goal, then who will?

LEIGH MCKEIRNAN

I HAVE LIVED 1200 FT BELOW THE PIPELINES IN THE KELSO SLIDE AREAS FOR 45 YEARS. THERE HAVE BEEN SO MANY SLIDES HERE IN THIS ALLUVIAL VALLEY, BEHIND US AND IN KALAMA, ALONG THE RIVER (CHECK THE RAILROAD RECORDS SINCE THE STATE HAS LOST THEIRS). THERE IS SO MUCH NATURAL BEAUTY AND WILDLIFE AND FISHING, IT WOULD BE CRIMINAL TO RISK ITS DEMISE AND VALUE IN EVERY SENSE WITH METHANOL NEARBY. CHECK OUT THE BEAUTY OF THE UPPER KALAMA RIVER WHERE WE USED TO PICNIC AT THE UPPER HATCHERY THAT GOT WASHED AWAY AND WATCH THE SALMON SWIM BY..OR WALK ALONG THE PORT AND SEE ALL THE PEOPLE NOW ENJOYING THE BEACHES AND FISHING WHO WOULD BE POISONED BY A METHANE LEAK.

Priscilla Martinez

We need to take better care of what is left of our environment, for our wildlife, and our marine life.

Rena Bailey

Hard to believe that you would read the environmental impact statement on this facility and still plan to go ahead with it. It's not only a bad idea, it's bad for the environment and bad for the people, air, wildlife, water, and all living things for miles around it. I strongly suggest that this project not be approved. Consider something besides profit in your decision. Do the right thing!

Michael Harmon

I do not support the proposed gas-to-methanol project that Northwest Innovation Works, LLC. wishes to pursue in WA state. We need to become less dependent upon fossil fuels, and take a stand to protect our environment for generations to come.

Mike Thomqas

I recognize and appreciate the further detailing of the economic impact of this project. I do not have the expertise to evaluate the furtherance of the project impact and will comment again once competent analysis is made. However...

This project remains as fracking in Canada with accompanying risks.

Transporting from Canada to Kalama with accompanying risks.

Manufacturing by using decreasing supply of mountain catchment river water.

Manufacturing by use of Columbia River power generated electricity.

Transporting product nearly halfway around the world to be redistributed from there and most probably used for power generation.

In sum, this remains as a danger to the climate, inefficient use of limited resources, and a divergence from more climate sustainable power generation such as nuclear and solar. We are getting lost in the weeds with analysis by fulfilling legal requirements - when an alternative is readily preferable for both China, US, as well as the earth.

Sandra Whitmore

No, just no! We cannot let this project move forward. A methanol facility right on the Columbia River? It only takes one accident/spill to irrevocably harm the river. Fracking is a threat to our precious groundwater. We should not support the fracking industry in any way.

Please protect our environment for future generations. Don't let short sighted and greedy corporations ruin our beautiful natural resources.

Anne Doane

Please reject this proposal to build the Kalama Manufacturing and Marine Export Facility, because as the report shows:

The project would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year. The Kalama facility would be one of the 10 largest sources of greenhouse gas emissions in the state. Since there are other renewable energy sources that can provide us the energy we need, it is illogical and short sighted to permit such a project like this.

Respectfully yours,

Anne Doane

Paula Overholtzer

Whooooaaa! This is just WRONG! I see that Northwest Innovation Works (China) has changed the NAME of the Kalama Methanol Plant/Project! I'm sure that this was done so that the project could slip through without notice by those of us who have been fighting this for YEARS! China and the USA are two of the main countries working to destroy this precious Planet Earth. Natural gas is not benign. It is another fossil fuel causing the climate crisis. Methanol spilled in the Pacific Ocean is not okay either. Nor is it okay to burn methanol as fuel in China, nor to make endless plastics from it!! This planet is severely abused by fracking and pipelines! Let's get past our throw-away plastics and reliance on fossil fuels. NO to the KALAMA METHANOL PLANT, under whatever name they have sneakily changed the project to!! Stand up for Planet Earth! Come on, Department of Ecology...you can do what's right!

Joel Hanson

The need for this project, has grown even more now with the current financial uncertainties. Our community needs these jobs more than ever before. The permitting for this project has gone beyond anyone's definition of reasonable. If climate warming is the major concern than it is clear to me that they are taking steps to reduce the impact on a global level. Please do not delay this project any further and approve it immediately.

Russ Ayers

As an investor and citizen I am categorically opposed to any scheme which increases our use of fossil fuels or, worse, which proposes to extract them for sale to other countries in the pursuit of short term profit. At the very least these resources should be viewed as strategically important and ideally as environmentally unsustainable to use. This project combines the worst of both and should be stopped. I am appalled that this project could have been conceived or planned outside of the US Gulf Coast.

Theresa Ayers

This project makes no economic or environmental sense and should be stopped in its tracks. In addition to a failed business and environmental case, the diversion of American fuel resources for the benefit of Asian countries runs contrary to our national interests.

Charles K. Hof

Fracking is the worst method of extraction for oil and gas and is not viable. To create a plant for the use of fracked fuel, and then ship it out of country for a use that may change strikes me as a bad idea and detrimental to the planet. For once it leaves our shores there is no control as to who or how it is used.

Larry Wilhelmsen

Dear Sirs:

How can you be spending all this time on carbon dioxide causing planet warming when the amount of cooling to be expected if the US stopped all fossil fuel burning now might only result in a fractional degree of cooling by 2100. How many real catastrophes might happen in this time frame? Spend money on real and present dangers!

Carbon dioxide emitted is greening the earth and providing additional food that is happening now and well documented. See Matt Ridley and CO2science.org.

The opponents goal is population control which science has proven to be short sighted. It is a power grab for a world wide government.

Bottom line is if producing more Methanol is a net benefit to earth's inhabitants go for it.

Larry Wilhelmsen

Marie Fisher

I oppose this project and request that Ecology deny the permit for NW Innovation Works to build a methanol production plant and storage facility in Kalama, WA.

Mary Duvall

building a methanol plant in the lower Columbia air shed is really a bad idea portending disaster for locals in 2 states as well as contributing to the on going destruction of the planet's climate. You know this. To even entertain such a proposal is unconscionable....The number of deaths globally from continuing the use of fossil fuels will make this pandemic pale by contrast. You know this. I don't have to quote the facts to you; you know them. I don't have to tell you that the The Chinese government-owned company NW Innovation Works corporation's arguments are specious, grasping at straws. You can see that yourselves. We have to change how we do business and how we live...we can and we must. Less plastic; more trees. Less greed; more sanity. Thank you.

Barry Truman

I was under the impression that we were trying to reduce, not increase, the most dangerous polluting substance known to man on our frying planet. Can you really be asking whether we like the concept of more methanol, especially in our state? No, we don't.

Victor Villasenor

Don't allow the world's largest fracked gas-to-methanol refinery to harm our climate and Kalama!

Washington State should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama, WA.

The project would use more fracked gas than all of Washington's power plants, combined. The company has sought to mislead regulators and the public about the purpose and impact of the refinery, falsely claiming that the project will displace "dirtier" forms of fossil fuels. We know that fracked gas is a potent greenhouse gas pollutant, and we are counting on Ecology to accurately account for the project's upstream emissions as well as the downstream pollution from the likely combustion of NWIW's methanol for fuel.

For the community of Kalama and for our climate, the risk is simply too big. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution. We are counting on you to stop this dirty and dangerous project.

Erik Christy

Dear Department of Ecology, State of Washington:

As a neighboring North-westerner, I am firmly opposed to:

1. The presence of any Chinese company on US territory. They represent the aggressive exploitative policies of the Chinese government which is hostile to American interests.
2. The environmental hazards of extracting and transporting methane from ANY U.S. site. The fracking itself is destructive, but allowing a hostile entity to use ANY U.S. based pipeline, trucking route or other delivery method through a U.S. port should not, under any circumstances, be permitted. The State of Washington and its public and private facilities should have more pride than to subjugate themselves to Chinese financial exploitative bribes.

Thank you.

Derek Benedict

Fossil fuels need to stay in the ground, and natural gas is one of them. And this project needs to be denied because it will convert natural gas to methanol, which will then be used to create even more plastic pollution.

We've got to stop project now!

constance atteridge

dear ecology,

are you freaking kidding? with global climate change (methane increasing greenhouse gas warming multiple times more than carbon) and the pollution of plastics in our bodies, drinking water, land, and oceans you want to facilitate the transportation of natural gas in and on the pristine waters and lands of the beautiful northwest? for what? money? are you insane? when will the madness stop? please just stop this!!! allow no facility to be built!!!

Richard Osmun

Too much allowed pollution from this project. I am opposed.

Patrick Conn

It is ludicrous to think that any conclusion other than the IMMEDIATE and COMPLETE DENIAL OF THIS ECOLOGICALLY DISASTROUS POLITICALLY-BOUGHT CORPORATE BOONDOGGLE, oh, excuse me, PROJECT is possible given the results of this second supplementary environmental impact statement. This detailed report confirms and makes clear that the project is simply another delusional megalomaniacal attempt by stupefyingly greedy human beings to make money from Earth's natural resources WITHOUT REGARD FOR THE REGIONAL ECOLOGICAL, ENVIRONMENTAL, and now SOCIAL CONSEQUENCES; an environmental disastrous result of their sociopathic rape of America's natural resources.

This process is supposed to protect the public's interest, not private abusers' and American traitors' interests. Please do so.

Linda Greene

I am opposed to the building of the Kalama Manufacturing and Export Facility. Fracking the gas to be used in the facility at the point of origin is dangerous and pollutes groundwater during the process. Then it is highly dangerous to transport. Creating the huge amount of methanol, the facility would add a tremendous amount of air pollution in the area and global warming throughout the planet. The fact that it is to be used for plastics instead of fuel is not a good argument. We need to decrease the production of plastics, not increase it. The non-recyclable nature of plastics with their lengthy half life is polluting our land mass and killing our marine creatures. The facility should not be built.

Sue Rutherford

Putting 5% more carbon emissions into the air? Aren't we supposed to be reducing the amount? How can putting more into earth's atmosphere mitigate the effects? Say no!

<https://www.sightline.org/2020/09/03/new-analysis-proves-kalama-methanol-project-is-a-climate-disaster/>

Pamela Tennant

I received a postcard regarding the Draft Second Supplemental....The postcard is addressed to Ethel Ann Riper, I am her daughter. Mom used to own property in the area but sold a couple of years ago. She also passed away on June 16, 2019. The postcard was forwarded to me as her trustee of her estate. Please feel free to remove her from your mailing list. sincerely, Pam Tennant

Mike Reuter

I am the mayor of Kalama but am speaking here as an individual.

This refinery is not feasible without a new pipeline.

The Kalama methanol refinery needs 320 million cubic feet of natural gas per day, the equivalent gas consumption of almost every major city in the N.W. combined. Yet, it does not have a contract for a single therm. With all capacity locked up into fully subscribed/contracted pipelines, how is NWIW going even to get this started? Which industry or utility company has the capacity or ability to give NWIW that much of this valuable resource? The following paragraphs are supporting this information.

SEPA Final Environmental Impact Statement

On page 7-2, section 7.3.2 of Kalama Manufacturing and Marine Export Facility September 2016
At this time, NWIW has not entered into contracts for the supply of natural gas to the proposed project.

The Power & Natural Gas Planning Taskforce July 2015

Westcoast pipeline is now fully contracted as N.E. B.C. producers have sought a market outlet for their growing production. In the last two years, Westcoast has run at its maximum available capacity nearly year-round (limited by maintenance restrictions).

N.W. Natural 2016 Integrated Resource Plan Chapter 1

Executive Summary 1.7

The case shows a resource deficiency of 30,000 Dth/day for the 2019–2020 winter, which grows to 270,000 Dth/day by 2035–2036. This resource deficiency is due to load growth, changes in peak day demand, and changes in the near-term resource stack while being partially offset by an increase in demand-side resources.

Pipelines remain at capacity.

While decontracting might be an issue for other pipelines, the situation is different in the Pacific Northwest. Capacity on Northwest Pipeline, which provides most of N.W. Natural's interstate capacity is fully contracted northbound through the Roosevelt Compressor station and fully contracted southbound through the Chehalis Compressor station.¹⁴ It is also anticipated that, as more electricity is generated using natural gas, existing pipelines will become even more constrained.¹⁵

The development of any high-pressure transmission pipeline on which the Company could acquire capacity will be primarily driven by one of these large load projects and secondarily by N.W. Natural and other regional loads.

Avista Corp 2016 Natural Gas IRP

Adding additional pressure to existing pipeline resources is the announcement of three proposed methanol plants in the region. The plants use large amounts of natural gas as a feedstock for creating methanol, which is used to make other chemicals and as a fuel. To date, the Port of Kalama is gaining ground in its approval process and is looking like the most probable of the three methanol plants and will take around 300,000 Dth/day in a region already constrained by pipeline deliverability. LDCs will have to compete with power generators, LNG exporters, and other large end-users for limited pipeline capacity. The new mix could alter current pipeline operations and the potential availability of infrastructure to the region.

Pipeline capacity is the link between natural gas and power.

nwnatural.com/AboutNWNatural/TheCompany/PipelineAndNewGasSupply/NeedForANewPipeline

Currently, N.W. Natural relies on a single transmission pipeline for about two-thirds of its natural gas supplies. That pipeline is nearly 60 years old and cannot be expanded easily. It frequently operates at its maximum capacity. The other pipeline serving our service territory is fully contracted out.

Inexpensive natural gas is attracting new manufacturing to the U.S. One enterprise has announced its intention to build two methanol plants at Columbia River ports and a third in Tacoma. Anyone of these would substantially add to regional gas demand; two or three would only be possible with the construction of more pipeline capacity.

Regional projections indicate demand for gas in the I-5 corridor will exceed capacity by 2020. If a significant petrochemical facility or other significantly large gas user starts up, this could occur even earlier.

The Power & Natural Gas Planning Taskforce July 2015

However, a large enough project, roughly over 150,000 Dth/day of demand (Kalama Methanol refinery would be 320,000 Dth/day), would likely need new infrastructure regardless of their preferred gas transportation type simply due to the high utilization of the existing pipeline systems. New load developments between Sumas and the Company's service territory might undermine the reliability of this service, especially if not accompanied by an equivalent capacity expansion of NWP's system and upstream infrastructure to get more gas supplies to Sumas

Mike Reuter

I am the mayor of Kalama, but speaking here as an individual.

Storage redelivery discount and the benefits of gas storage

During the wintertime, there is excess gas capacity on the pipeline that supplies the NW due to not having to heat homes and businesses. That lower-priced gas is bought by utility companies and injected into the underground storage facilities- Jackson Prairie Natural Gas Storage Facility and the Mist Underground Natural Gas Storage Facility. This natural gas is purchased at a substantial discount due to not having competitors to bid for large amounts of natural gas because of the fact that North America is Canada's only customer.

If this methanol refinery goes in, China now having a natural gas export terminal will now be able to compete with American utilities at Trading Point 2 located in Canada for long term gas capacity contracts. The remaining gas will make it challenging to fill the storage tanks, and the gas purchased will be at a much higher rate, thereby causing higher prices for businesses and consumers. The law of supply and demand goes into effect.

Example of just one utility discount:

Cascade's IRP appendix a

The storage redelivery discount saves Cascade ~\$750,000 annually compared to year-round max rate capacity.

According to Factsheet: Jackson Prairie Natural Gas Storage Facility:

Benefits of storage- Natural gas held in storage supplements the interstate pipeline system to help meet the region's energy requirements during the coldest days and weeks of winter when consumer demand spikes significantly. Jackson Prairie's storage ensures that natural gas supplies are available during the year to meet the public's needs. In addition, Jackson Prairie helps to stabilize utility customers' energy costs and soften the impacts of price volatility in the wholesale natural gas market. Jackson Prairie allows PSE and other utilities to buy and store significant amounts of natural gas during the lower-priced summer months, and then tap the reserves in winter when customers' natural gas requirements—and wholesale natural gas prices—are highest.

Don Steinke

1. Did NWIW, or the Port of Kalama, or Cowlitz County help write the SSEIS?

Esther Kronenberg

I write in strong opposition to the Kalama Methanol Refinery. The SEIS has failed to consider vital information about the impacts of fracking, pipeline transportation and the air and water pollution associated with these activities.

Further, the reasoning that there would be even worse pollution from other similar plants if this one is not built is ludicrous. The SEIS must consider the REAL impacts of this facility, and cannot speculate as to what may happen.

What WILL happen is that this plant will generate enormous amounts of climate pollution, lock us into fossil fuel production for decades, and emit dangerous levels of air pollutants.

How the "green" Governor can allow this to go forward is confounding. Our State deserves better, our country deserves better, as does the planet. Do not proceed with this destructive project.

Thank you.

Linda Leonard

If built, the Kalama methanol refinery would create a huge increase in greenhouse gas emissions for the state of Washington and would move us far away from achieving our climate goals. Kalama needs to invest in a clean future, not more dirty fossil fuels. I oppose this project and hope our elected officials will do the same.

Anonymous Anonymous

I am the mayor of Kalama, but speaking here as an individual.

This refinery, I believe, is a regional energy security risk.

Having this methanol consuming more than $\frac{1}{3}$ of all available gas capacity or 320 Dth/d out of 500 Dth/d from the only pipeline that supplies natural gas on the I-5 corridor from Sumas WA to Washougal WA is too much to give one company. They also want 100 MW of clean hydropower, which is like gold when it comes to GHG reductions. What type of energy is going to gap the distance between fossil fuels and renewables? There is no way that you can close all of the coal-fired power plants without a backup for renewable energy. For every watt of renewable energy, you need a watt of firm backup because sometimes the sun doesn't shine and the wind doesn't blow.

We will be at the mercy of the Chinese if we want to move out of coal and oil. The refinery owners will be able to sell gas capacity and hydro to trade for carbon credits or to lower GHG emissions requirements.

How vital natural gas is to Governor Inslee's legislation.

According to the 2018 Pacific Northwest Gas Market Outlook information brochure:

The forecast step increase in gas for generation (2021-2022) coincides with the retirement of several coal-fired generation units that currently serve the region, including Boardman in Oregon (end of 2020), Centralia Boiler 1 in Washington (end of 2020), and Colstrip Units 1 & 2 in Montana (mid-2022). This forecast demonstrates the expectation that natural gas will play an increasingly important role in maintaining system reliability and affordability as policymakers drive the region toward a cleaner energy future.

"Companies often choose both in parallel. Investments in gas dilutes the shift to renewables", stated Galina Alova of the Smith School of Enterprise and the Environment at the University of Oxford. If you look at every utility company's IRP future energy requirements, they include large amounts of natural gas capacity to achieve the goals set by Governor Inslee's legislation. It requires power companies to reduce emissions by at least 25% below 1990 levels by 2035.

That's why NWIWs biggest partner Stonepeak Infrastructure Partners are heavily involved in this refinery. Stonepeak Infrastructure Partners focuses on investment in the energy, power and renewables, transportation, utilities, water, and communications sectors. Nothing in its portfolio about plastics and olefins.

Cowlitz County PUD E3 reliability study states:

Resource Adequacy in the Pacific Northwest-Serving Load Reliably under a Changing Resource Mix

Significant greenhouse gas emission reductions leading to a deeply decarbonized grid can be achieved as long as sufficient firm capacity is available during periods of low wind, solar and hydro production to maintain adequate Resource Adequacy

Also, what are the key findings of the E3 reliability study?

The key findings are:

1. It is possible to maintain Resource Adequacy for a deeply decarbonized Northwest electricity grid, as long as sufficient firm capacity is available during periods of low wind, solar and hydro production;
2. It would be extremely costly and impractical to replace all carbon-emitting firm generation capacity with solar, wind, and storage, due to the very large quantities of these resources and the associated transmission construction that would be required;
3. The Northwest is anticipated to need new capacity in the near-term in order to maintain an acceptable level of Resource Adequacy after planned coal retirements; and
4. Current planning practices risk underinvestment in new capacity required to ensure Resource Adequacy at acceptable levels.

We need to electrify all energy requirements and to move out of any long term fossil fuel infrastructure. We also require all available resources to move into a carbon-free future. It is not right for us to use all of the non-renewable resources now. The 100 years of the gas ability myth, even if it is true, is a short time for humankind. Just because we can-doesn't mean we should.

John Flynn

The main purpose of this proposed project is to provide the Chinese government with a source of methanol that they can use as either a source of olefins for the plastic industry or as a fuel for transportation and industry. NWIW has stated that the intent of the methanol they will produce is intended for plastic manufacturing. The truth of the matter is that once the methanol is sold on the open market there is no way to control what it is used for.

The speculative theory that methanol produced by NWIW would result in a net reduction of global green house gas emissions due to global methanol market displacement is ludicrous. Fracking gas, transporting it through pipelines, refining the gas into methanol, transporting the methanol via tanker ship and ultimately burning the methanol all add to the global climate change crisis.

Department of Ecology needs to focus on what they can control within the State of Washington and not buy into the speculative theories that the proposed project would be "good" for the global environment. The fact of the matter is that reliance on fossil fuels is what got us to where we are now in the first place; global warming, ocean warming, sea level rise, shrinking sea ice and ocean acidification.

I encourage the Department of Ecology to adhere to the facts that this project would add a total of 3.6 million metric tonnes of green house gas emissions per year and deny the project on that basis. Thank you for your consideration

Teresa Flynn

This Methanol Refinery will pollute our town and State of Wa. This location is a Migratory Bird route We dont need the fracked gas, The pipeline, and damage to our environment. It also a glutonous use of gas

Linda Leonard

Northwest Innovation Works' cannot be trusted. They have deliberately misled the public and the state of Washington about the environmental, health and safety impacts of this project. They expect us to trust them after they lied about plans to burn the methanol as fuel?

The new SEIS analysis released what NWIW has denied, the refinery would use more methanol to be burned as fuel in China which would cause significantly more greenhouse gas emissions.

The proposed largest fracked gas to methanol refinery in the world would become one of Washington state's most significant sources of climate changing pollution and use more fracked gas than all of Washington's gas-fired power plants combined.

The draft study shows the refinery would cause a staggering 4.6 million tons of climate pollution every year for 40 years. The climate consequences are enormous.

I live in Kalama and oppose this dirty project.

Carol Marier

Please reject the proposed methanol plant in its entirety. The Kalama area is too beautiful to turn it into a top 10 polluter site in WA state.

Bad for health, too many risks! Again, please, NO METHANOL!

Sincerely, Ms. Marier and family

Anonymous Anonymous

I am speaking here as an individual and not as the Mayor of Kalama.

When would this refinery start contributing to SW Washington?

From the Final Economic Impact Analysis of the Proposed Kalama Manufacturing & Marine Export Facility

Methanol plant construction is a major undertaking. KMMEF would be the first methanol plant on the West Coast. As such, much of the equipment and engineering work necessary will come from outside the local region.

Since it is a manufacturing facility in an official high unemployment county, the state exempts some construction components, notably new machinery and equipment, from sales tax.

This refinery is exempt from collecting taxes on the methanol it exports. Washington does not impose sales & use taxes on goods manufactured in the state and exported to other states or countries.

Because Washington recognizes Cowlitz County as a high unemployment county, qualified machinery, equipment, and buildings are also exempt.

As for the land, NWIW will lease, not own the property on which the plant would be erected, so there is no property tax on the land itself.

Washington law requires county assessors to appraise industrial properties at 100 percent of their true and fair market value.

The Kalama methanol refinery's assessed value falls per the Washington Department of Revenue schedules

1st Year Property Tax \$ 16,469,425

10th Year Property Tax \$ 9,287,676

The businesses at the port pay no state corporate or personal income taxes.

They will get \$100 million in sales tax breaks through 2021 and \$43 million in local tax breaks. (We need to know if there will be an extension of these tax breaks)

They have applied for \$11 million in federal money for their dock and a \$15 million low-interest loan for the groundwater well.

John Flynn

The Washington Department of Ecology needs to be reminded that their ultimate responsibility is to the residents and citizens of the State of Washington and not to a wholly owned subsidiary of the Chinese government.

Department of Ecology needs to focus their attention on what they can control within the boundaries of the State of Washington and not lose focus by concerning themselves with speculative theories regarding future global methanol production and markets.

In addition the Department of Ecology needs to be reminded that the state legislature has passed an aggressive goal of reducing green house gas emissions in the state to 1990 levels by 2020. Revised Code of Washington, Chapter 70.235, Limiting GHG Emissions, establishes these goals as well as stipulating that the state would:

- 1) limit and reduce GHG emissions
- 2) minimize the potential to export pollution
- 3) reduce emissions at the lowest cost.

Currently the states GHG emission levels are 7.0 million metric tons higher than the states 2020 target. The state is not meeting their goals. If allowed to become operational the proposed methanol refinery would add an additional 4.6 million metric tons of carbon dioxide pollution per year. That would be equal to around 5 percent of the States total climate emissions and would rank the methanol refinery among the top 10 polluters in the state.

Again, the Department of Ecology needs to focus their attention and efforts on what they can control within the state and not enable a corporation that is a wholly owned subsidiary of a foreign government to use up our resources, namely gas, water and electricity to export their product for the benefit of a foreign government leaving SW Washington with the environmental impacts.

In my opinion this would equate to environmental piracy.

I encourage the Department of Ecology to deny the permit.

Thank you.

Linda Horst

In reviewing the DSSEIS, two things have become very apparent:

1. Anything that is SUPPORTIVE of the Kalama methanol refinery is based upon SPECULATION.
2. Anything that is NOT SUPPORTIVE of the Kalama methanol refinery is based upon FACTS.

The myriad reasons to reject this polluting, dangerous proposal are obvious. I am counting on Ecology to do the right thing for Washington by denying the methanol refinery.

Don Steinke

Ecology used the 100-year time frame for the climate impacts for fugitive methane, but the next 20 years matter most. The CO₂ equivalent of fugitive methane for the first 20 years is much higher than the 100-year time frame. I believe the EPA admitted they got it wrong and changed their protocols.

That first twenty years matter most because feedback loops are not included in the IPCC models and if we don't reduce emissions ASAP, feedback loops could kick in soon and then we could have abrupt climate change.

Then it is game over.

Don't gamble with your future. Say no to Kalam methane.

Don Steinke

Say no to Kalama methanol for the following reasons:

If approved, Kalama methanol, would contradict two pieces of legislation that were signed into law last April.

1. HB 2311 establishing the state goal of reducing ghg emissions in our state 45% by 2030, and 95% by 2050

Kalama methanol would increase ghg emissions at least 1 million tons per year according to this SEIS. The law does not allow for mitigation out of state, real or pretended.

Kalama methanol would create an extra burden on existing business to reduce emissions even more to compensate for Kalama methanol.

2. Also SB 5323 Bans certain plastic bags by 2022. The world needs more use of reusable bags, not more plastic bags.

This proposal violates the intent of the legislature. Say no.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

Local employment being 200 permanent jobs and 1000 construction jobs and salaries of \$109,000?
Depends-

For emissions and safety, it is less than 115 permanent jobs and 560 construction jobs

Kalama SEPA documentation for emissions estimates. Table A.3, pg. 193/241 states there will be less than 100 jobs

In the FEIS App. G. PDF pg. 45/84. For onsite populations and building categories;

(These numbers look like the actual employment numbers for a methanol refinery of this size)

Total employment 114.8

In the Draft Supplemental Environmental Impact Statement, November 2018 Table 3.1 Pg. 124/241
Construction jobs 560

However, In the local newspapers, there are going to be 240 permanent and 1000 construction

employed.

President of methanol firm talks permits, jobs at EDC meeting Feb 27, 2014

Northwest Innovation says each plant would eventually employ 240 full-time workers and create more than 2,000 construction jobs. The city of Dalian is planning to build an 8 million metric ton storage tank for the product. The lowest-paid jobs would have salaries in the \$40,000 to \$50,000 range.

Northwest Innovation Works moving headquarters to Port of Kalama.

Marissa Luck Jan 29, 2015

Northwest Innovation says it expects to employ nearly 1,000 construction workers to build the Kalama plant and 240 permanent workers at full capacity.

And at Port Westward- the sister refinery of the Kalama refinery being proposed by the same company, and based on the same information, there are different numbers.

Crowd Gathers For Methanol Presentation by Deborah Steele Hazen

The Clatskanie Chief of Clatskanie, Oregon

In their interview last week with The Chief, the developers said that approximately 30 to 40 percent of the total 240 employees (120 per phase) would-be managers, chemists, and engineers, most of whom would be moving to the area. The rest would be hired locally. All of the jobs would be "good, family-wage jobs," meeting the state's definition of that term, Godley said.

Methanol company switches land options at Port Westward. Anna Del Savio Friday, May 10, 2019

The option agreement allows NWIW to produce methanol but prohibits the manufacturing of Liquid Natural Gas. The initial project "is expected to generate a minimum of 100 full-time equivalent jobs, but no less than 70 jobs," according to the amended option to lease agreement.

Other methanol refineries numbers prove the lower numbers, not the higher ones.

Natgasoline LLC is a green world-scale methanol production complex in Beaumont, Texas
108 permanent jobs.

Methanex plans up to \$1.4 billion methanol plant in Geismar -- it's third there JUL 19, 2019 -
Through the project, Methanex will create 62 new direct jobs,

John Flynn

In April of 2019 Oregon Public Broadcasting released an article that revealed that Northwest Innovation Works had been misleading the public and state regulators for years regarding the planned use of the methanol that they hoped to produce at their proposed fracked gas to methanol refinery. In documents obtained by OPB, titled NWIW Gas to Methanol Investment Overview, dated March, 2018, NWIW used a PowerPoint presentation to potential investors that specifically detailed the intent to burn their methanol for fuel. More than a dozen pages of the presentation discuss using methanol as "clean fuels for industries and transportation." NWIW referred to their product as "liquid sunshine", "clean crude" and "convenient LNG". Of the 26 page presentation only one was devoted to methanol for olefins.

Further clouding this discrepancy is the fact that Wu Lebin, the Chairman of the Chinese Academy of Sciences Holdings Company (CASH) has publicly stated on several occasions that the methanol produced at the Kalama refinery would be used as fuel for both marine and ground transportation as well as power generation and industrial boilers.

In addition to these glaring discrepancies NWIW sponsored a two day workshop in 2017 at Stanford University where there was no mention whatsoever about using the methanol for creating olefins for the plastics industry.

This false narrative has been used by NWIW for years to mislead the public and state regulators regarding the true intentions for the end use of their methanol.

The question remains; who are we to believe, the Chairman of the Academy of Sciences Holdings (CASH) or a paid spokesperson of the wholly owned subsidiary.

I encourage the Department of Ecology to see through this obfuscation and categorically deny any and all permits for this polluting proposal.

Thank you.

Jennifer Vinnard

Too much speculation surrounds this proposed refinery, and adding nearly a Million metric tons of ghg emissions to our atmosphere, purely for China's benefit is not worth the \$30-\$40 million a year in taxes...the state makes more from cannabis taxes..it's not worth destroying our beautiful state! From the start of this project, NWIW has been downplaying the facts, has been caught lying about the intended use for the methanol, and has preyed upon our need for local jobs, few of which will actually be filled by local residents. This refinery would use more natural gas than several large cities combined, severely reducing and limiting stock for current consumers as well as future construction. The real winners of this refinery would be China, and we'll be left with the environmental and economic impacts, loss of revenue to local businesses, and it just isn't worth it! Don't sell out our wonderful state for China to reap the rewards. We're better than this! We don't need this type of pollution nightmare in Washington, there's thousands of other industries that wouldn't have such negative impacts. Please protect Kalama and Washington, we're counting on you! Thank you, Jennifer

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

I believe that there will never be a second train constructed for methanol production based on some articles.

Crowd Gathers For Methanol Presentation by Deborah Steele Hazen
The Clatskanie Chief of Clatskanie, Oregon

In addition to the two phases planned for Port Westward, the company has announced the third phase to be built in Kalama - another \$1 billion investment.

In the 2017 PSE Integrated Resource Plan on pg. 273/384 it shows the gas capacity needed for this refinery would be 180 Dth/d and not the 320 Dth/d required to run two trains at 100%

The footprint is too small for the two train refinery along with the ULE and the ZLD infrastructure. If you look at the refinery layout, these major additions are no-where to be found. It would be interesting to have the model and type of each of these two new additions with the dimensions needed to implement. I would also like to know if there is any additional space needed for the accompanying support structures, like cooling ponds or storage facilities for chemicals or waste.

That means half the taxes and half the employment

Don Steinke

Here's another reason to reject this proposal.

In 2016, Inslee issued an executive order that requires polluters to reduce their emissions 5% every three years.

In January of 2020, The Washington State Supreme Court reaffirmed Ecology's authority to regulate greenhouse gases from facilities such as paper mills and methanol refineries, but has now put the urgent need to regulate emissions from indirect sources such as tailpipes, and gas boilers, and other sources in the hands of the Legislature.

But for now, Kalama methanol will need to comply. How will they do that?

Sandra Davis

The Dept of Ecology seems to be relying on speculation that this proposed methanol project in Kalama, Washington would displace existing methanol plants in China currently using coal in their production. This speculation theory could also assume other manufacturers in China would burn 100% of their methanol as fuel instead of producing olefins for plastic, if this project was built. The result would be a huge increase in GHG. There is no evidence either theory will happen. The SSEIS should not rely on speculation.

The natural gas needed for NWIW's project would exceed the limits of Williams' Northwest Pipeline and would require an expansion of an additional line to accommodate the methanol facility. Why has the expanded pipeline not been taken into consideration in this analysis? The expansion of this pipeline will have many negative impacts to the citizens of Washington state as well as the many, many landowners.

If NWIW obtains all of the needed permits, their plan could be to sell the permits. What would prevent this new owner from using 100% of the produced methanol for fuel, thereby increasing GHG substantially.

In reading the Voluntary Mitigation Program proposed by NWIW, the language leaves the reader to feel uncertain what role the Department of Ecology will play in this mitigation. I have never heard of a "voluntary" mitigation proposal for such a large industrial project. As you know, self-reporting does not always work. What recourse will the Department of Ecology have if a voluntary program fails? Why hasn't the Department of Ecology required their own Mandatory Mitigation Plan?

NWIW is proposing to distribute an Emergency Response Plan "before" the first production of methanol. Emergency Response Plans and Hazard Mitigation must be a part of the permit process. Our state and local officials have a right to review and/or change any Plan that would involve their services and impact citizens. This is totally unacceptable. The safety of the public must be foremost in permitting any industrial project which will involve hazardous materials.

Thank you for accepting my public comments.

Don Steinke

The standard operating procedure for a regulated gas monopoly, such as Williams Pipeline, is to create demand for their gas until the system reaches maximum capacity.

In that light, they view the Kalama Methanol plant as an anchor project similar to what a developer does when he gets a Safeway to build first, and then attract other business to surround it. Then

Then they go to the Utilities Commission asking permission to raise rates on existing customers to pay for added capacity needed to prevent shortages during peak load.

The Kalama methanol plant could cause shortages for some existing business depending on their preferential allocation.

That's probably why the Williams Pipeline Company is advertising heavily on FB about gas being a climate solution, which is a lie.

Does your EIS evaluate the possibility of a second pipeline and the associated emissions?

Janet Kirkland

Woodsy Owl says "GIVE A HOOT, DON'T POLLUTE."

I oppose the Kalama Fracked Gas to Methanol Refinery Project and request the permit be denied.

The SSEIS clearly shows this project will be a major greenhouse gas polluter. We already know methanol is a fast acting greenhouse gas with enormously negative climate impacts. It leaks at every stage of production and transport.

The clock is ticking for our planet and we need to invest in renewable energy NOW. We just saw record breaking temperatures in California and another raging fire season is starting early. The CLIMATE CRISIS cannot wait. Let's lead the way in creative investment in renewable energy jobs and infrastructure that will benefit everyone for generations to come.

Linda Horst

As a lifetime resident of this beautiful, evergreen state, I trust that Ecology will honor their mission statement..."to protect, preserve and enhance Washington's environment for current and future generations".

Adherence to Ecology's mission statement, promised to all Washington residents, can only be achieved by rejecting the Kalama methanol refinery.

Anonymous Anonymous

I have worked on the Columbia River for much of my adult life and feel that NWIW and their shipping partners will be positive and responsible members of the business community on the river speaking forcefully for the best safety practices.

Gary Wallace

To consider permitting this facility at this time of extreme climatological change, as evidenced by the massive wildfires (smell and breathe the smoke--it will shorten your life), the extreme weather in both major oceans as demonstrated by the number and frequency of hurricanes and typhoons at levels of strength never recorded, the change of rain patterns that have created droughts in food producing areas world-wide, the rising sea-levels that will destroy almost every major coastal city in the USA and world, the massive DESTRUCTION of our oceans' food-chains due to PLASTIC pollution and micro-plastics now in our food-chain and that likely contributes to the rising negative health-effects on children's development ---therefore, our future---would be tantamount to supporting the mass murder of our planet. Everything this proposal wants to do is contrary to the well-being of the environment that your department is tasked with protecting! Any acceptance of this fossil-fueled project, especially the manufacture of plastics, as originally promoted---although now revealed to be inaccurate and NWIW admits will also likely be used as fuel--doesn't that usage require a different permitting process?--are both unacceptable. The burning of methanol as fuel is very different in the emissions. NWIW is dishonest and willing to lie to get "through" this process. As per the Port of Kalama to present their letter of conditional use and their proposed financial fines to control the NWIW product from Kalama is totally unenforceable and therefore a moot point pertaining to qualifying this project. Your decision must not be a "blinded" acute case to review this project as if it exists within only its own universe without connecting "ALL-OF-THE-DOTS" relative to the current---now, today--environment locally, statewide and globally. Our climate is a chemical soup. It now exists at "the tipping point" of a catalytic conversion. This project will add-to the real consequence of "flipping" the world's livability by causing a conversion into compounds that may not support life as we need to exist---with all other life. Your burden is to protect our lives. Corporations, nor any person or entity, should be allowed to operate when their actions contribute to the deaths of people, climatological instability and the immediate, near-term future of our well-being. DOE must review the UN Climatological Report to be released tomorrow, the 9th of September, to be truly current and scientifically guided and make the only decision of "DENIAL" of this project. It is poison! Regarding the claim made that this refinery will offset other dirty energy plants is based upon what evidence from any other similar project? NWIW, the POK and the Cowlitz County Commissioners, to my knowledge, have not presented any supporting evidence that this has previously been accomplished. Has the plastic pollution and the total negative effects of that portion of this proposal been reviewed and included? As plastic deteriorates and becomes exposed to the elements it may have even greater GHG releases. This is an emission. It should be, or should have been, assessed in this review. I don't see it. Your decision must be: NO!

Bill Kirkland

Please reject the Kalama methanol refinery project. It makes no sense to increase GHG pollution when scientists have been warning us for years about the current climate crisis.

Greed and profit should not win out over responsible stewarding of our precious resources.

Tika Bordelon

please respect the environment and other species that call this area their homes. humans need to learn how to exist with nature rather than try to control it. please stop polluting our fragile earth.

Teresa Flynn

Department Of Ecology State of Wa. Needs to protect the citizens of Washington From this proposal from NWIW of the speculative theories that this would be good for the world and will cut Green House Gas emissions. This has gone on long enough and needs to stop. Put a end to this.

Lauren Sewell

I am gravely concerned about the environmental impacts of the proposed Kalama methanol facility. I do not support the construction of this facility, and I do not believe that the environmental impact statement takes into account the harm this facility will cause on the people of Kalama, its wildlife, its land and its future.

Wesley Allen

As the northwest forests are engulfed in flames during another unprecedented fire season and our communities fill with thick smoke, my hope is that we can all seriously reflect on questions that matter:

Is it in the public's best interest to allow a methanol refinery that will emit 4.6 million tons of climate pollution every year, becoming one of WA's largest greenhouse gas polluters? Should we permit a single corporation to profit by exporting fracked gas to Asia, at the expense of our waterways, fisheries, health, and our children's future? Is it ethical to further entrench our energy systems in the ways of fracked gas, at the expense of clean energy technology and innovation?

Kathleen Martin

The methanol plant would sell our natural resources to a foreign entities. Those resources could be better utilized here, at home. This would also encourage the production of even more plastics, in a world where there are no truly viable options, at this time to recycle, or reuse them. Along with this as something of this scale has not been done until now, no one can ensure how safe it will be to manufacture or ship this, particularly overseas. This will be an eyesore, and has huge potential to damage our river systems. Please do not endanger ours, or our children's future with this project. Protect our planet.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

The refinery would adversely impact iconic salmon of the Northwest due to the nighttime lighting from the refinery. The refinery would be located just downstream of the Kalama River, home to two fish hatcheries. Salmon migrate from spawning areas through rivers, and estuaries to the ocean, often moving at night. Returning adult fish also migrate at night. The higher lighting along this route will interrupt the migration, increase predators that prey on the migrating fish, and ultimately reduce the number of returning salmon.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

The sheer volume of gas required. This methanol refineries demand for natural gas is unfeasible without a massive expansion of gas pipelines and wells, including hundreds, if not thousands of new gas wells.

The remaining gas provided to the NW is just enough to get us by until renewable energy can cover all of our needs. The natural gas needed by residential and business customers lowers every year due to conservation and energy efficiency measures.

The gas companies know this. They know if there is not a large investment now that consumes substantial amounts of gas, then within a couple of years, there will be no need for expanding the pipeline, even with a large natural gas consumer. That's why the gas companies are trying to build a fertilizer plant in Longview, an LNG export facility in Tacoma, a gas to methanol terminal in Kalama, and the Jordon Cove LNG.

It's a lose-lose project. If this refinery somehow makes money for the next 30 years, it will lock the NW into decades of natural gas dependency. If it doesn't last the decades promised, the ratepayers and taxpayers have to pay back the billions of dollars in increased infrastructure costs to supply the refinery. The company would be long gone and leave us paying the bill.

It is very concerning that a project that takes more than 2/3 of all the available capacity available to the entire NW has not had a thorough investigation for present and future energy needs.

EFSEC or the Washington Utilities and Transportation Commission should have reviewed this project. Methanol was never thought of as a large energy transport carrier. The loophole that these facilities are using needs to be closed or this will be one of many that will use this blueprint to export large amounts of Canadian gas without outside oversight.

Linda Leonard

Reading the DSSEIS the Climate Science Special Report developed by the U.S. Global Change Research Program (USGCRP) predicts a similar set of impacts including (Mote et al 2014):

Increased average annual temperatures.

Change in average annual precipitation.

Lower stream flows west of the Cascades.

Increased wildfires, insect outbreaks and diseases leading to widespread tree die-off.

"In Washing state, more acres were burned Monday than were charred in the past 12 fire seasons," Governor Jay Inslee said, "and dry conditions continue to fuel the blazes. In one eastern Washington town flames destroyed more than 80% of homes and public infrastructure." This is a new reality we're living in with a changing climate," he added.

Governor Inslee announced his opposition against the methanol project, sending a strong signal against fossil fuel stating "the impacts of climate change are already coming to bear and scientists are saying that unless we reduce carbon emissions by half over the next decade, we will reach a irreversible tipping point."

Is this the direction the state of Washington wants to go by locking in 40 years of fracked gas to methanol from the Kalama Manufacturing and Marine Export Facility in Kalama?

As a resident of Kalama, I am concerned for the health and safety of the citizens in this community from the risks of this proposed refinery. I am urging the Department of Ecology to reject the proposed methanol refinery from proceeding.

Ruth Dallas

It is past time to stop building fossil fuel plants period. Many professionals will comment on the dangers of this project. I will just ask the committee members this: When will you decide that no number of jobs and no increase in your tax base is worth destroying the well being of your children or mine. When it is too late, when the rising temperatures are irreversible what will you tell your children you did to stand up for their lives. Every plant only adds to the problem but together they doom the planet.

Beppie Shapiro

This Second Supplemental EIS shows more detrimental implications of the project than the original EIS. But the bottom line I hope you'll consider is, this Facility will increase and sustain the use of fossil fuels worldwide (at a danger to the people of Washington). This summer of fires should convince you that we must immediately DECREASE use of fossil fuels, not debate details of how bad this Facility would be.

Mike Reuter

I am speaking as an individual and not as the Mayor of Kalama.

The only reason that the Department of Ecology had to get another supplemental review process done is that the backers of this refinery didn't provide the information needed to help the Department of Ecology to approve or deny the permit.

It shouldn't be the job of the Riverkeepers, Sierra Club, and other environmental groups to do all the work that should have been done by a government agency or a real third party review process.

This supplemental review should have also been paid for by NWIW since they didn't want a thorough examination done the first time by the state or federal agency.

What makes it more frustrating is that when the numbers provided are inaccurate, outdated, and challenged, the financially biased entities cry foul and say that the state keeps moving the goal post.

This refinery needs to be looked at more closely by the state because of the RCWs information listed below.

ENERGY FACILITIES AND RCW's

RCW 80.50.010

Legislative finding—Policy—Intent.

The legislature finds that the present and predicted growth in energy demands in the state of Washington requires the development of a procedure for the selection and utilization of sites for energy facilities (methanol is an energy option) and the identification of a state position with respect to each proposed site. The legislature recognizes that the selection of sites will have a significant impact upon the welfare of the population, the location, and growth of industry, and the use of the natural resources of the state.

It is the policy of the state of Washington to recognize the pressing need for increased energy facilities, (which is not plausible without enough natural gas capacity) and to ensure through available and reasonable methods, that the location and operation of such facilities will produce minimal adverse effects on the environment, ecology of the land and its wildlife, and the ecology of state waters and their aquatic life.

It is the intent to seek courses of action that will balance the increasing demands for energy facility location and operation in conjunction with the broad interests of the public (How does this one facility that consumes $\frac{3}{4}$ of all the NW pipeline capacity, 100 MW of clean hydropower and 4 million gallons per day of water sent to another country constitute broad interests of the public?)

Such action will be based on these premises:

(3) To provide abundant energy at a reasonable cost.

(This fact alone is not feasible due to the massive consumption of natural gas on an already fully contracted pipeline. Canada is losing billions of dollars each year due to not being able to export its natural gas, which means if Canada can export its gas, the NW will pay these "billions" in higher gas prices. This refinery will open the spigot of our gas supply to the world.).

RCW 80.50.020

(4) "Associated facilities" means storage, transmission, handling, or other related and supporting facilities connecting an energy plant with the existing energy supply

(The refinery will be connected to a natural gas pipeline, which is an energy supply, methanol is a type of alternate energy)

processing, or distribution system, including, but not limited to, communications, controls, mobilizing or maintenance equipment, instrumentation, and other types of ancillary transmission equipment, off-line storage or venting required for efficient operation or safety of the transmission system and overhead, and surface or subsurface lines of physical access for the inspection, maintenance, and safe operations of the transmission facility and new transmission lines constructed to operate at nominal voltages of at least 115,000 volts to connect a thermal power plant or alternative energy facilities to the northwest power grid.

(This facility will need 100 MW of electricity from the grid)

(Methanol is an alternative energy facility since methanol is as an alternative fuel under the Energy Policy Act of 1992.) It is also an energy plant because it will be able to make 100MW of electricity and sell it to the grid from its onsite gas-fired power plant.)

Linda Boyd

I urge you to say "no" to the Kalama plant, which would be another nail in the coffin for human life. The west coast is choking as our life-giving forests go up in smoke. Atmospheric carbon levels are soaring past 415 ppm, arctic ice is melted, and the jet stream is unstable. Forget about your grandchildren, it is now unlikely that people born today will be able to live out their natural lives due to climate chaos. Shame on NW Innovation Works and their deadly plans! Please, vote 'NO' on the Kalama plant.

Brice Crayne

Dear Ecology colleagues,

I grew up in Kelso, WA fishing the Kalama River as a third generation Cowlitz County resident raising a fourth generation. I oppose the installation of a methanol refinery on Port of Kalama property and request that Department of Ecology reject the methanol refinery and deny the Shorelines Permit for the project.

I'm familiar with the shorelines permitting process through my work as a project manager developing fish habitat in SW WA State. I work for a non-profit (not mentioned by name because I am writing as a citizen) working to recover fish habitat conditions that were damaged by human activities in 16 watersheds including the Kalama River. In fact, we completed a project on Port of Kalama property in 2018 with a sizeable donation from the Port to complete the project. I have also worked at Steelscape, Inc. and support most of the Port activities.

However, there are a few facts that stand in my way of supporting bringing this kind of business to our community. First, Ecology's analysis demonstrated that the project would produce 4.6 million tons of carbon pollution each year, or more. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C.

Next, it appears that NWIW is seeking alternative buyers for the methanol and while initially they didn't propose to burn any of it for fuel, in 2018 and 2019, NWIW informed potential investors that methanol from the planned

refinery COULD be burned as fuel overseas. Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year.

Last, I cannot support any company that supports a "not in my back yard" mentality. Negative impacts will be spread worldwide including the fracking sites in Canada, local pollution at the refinery, leakage of greenhouse gasses during transportation, manufacturing wastes at plastic production plants, and longterm greenhouse gas pollution from burning methanol.

Personally, I can't imagine trying to regulate these activities and coming up with a sound mitigation plan that properly mitigates for all of these impacts. I appreciate the Shorelines process and the opportunity to submit comments.

Teresa Flynn

My husband John & I retired to Kalama, Wa. NWIW is proposing to build a fracked gas to Methanol refinery here. There is no way this project would reduce carbon emissions, in fact it would increase carbon pollution in huge amounts. This is their shell game and we would be the losers. Dept. of Ecology needs to protect the citizens from this Polluting nightmare.

Diane Dick

Please deny Kalama Manufacturing and Marine Export Facility (KMMEF) a substantial development and a conditional use permit. The environmental impacts from the project are significant and cannot be mitigated.

The greenhouse gas emissions are not fully accounted for in the draft second supplemental environmental impact statement (SSEIS) and the data contains errors and omissions.

In 3.4.2 Upstream emissions it is stated, "GHG emissions from the local natural gas distribution system are not attributable to the project because KMMEF will have its own dedicated high-pressure connection. As described in the First SEIS, natural gas will be supplied to KMMEF from the existing interstate transmission pipeline via a new 24-inch 3.1-mile lateral interconnection pipeline. Northwest Pipeline LLC is proposing to construct and operate this interconnection pipeline, which is known as the Kalama Lateral Project."

Presently there is no high-pressure gas connection to the KMMEF site in existence. In the no build alternative to KMMEF there will be no Kalama Lateral pipeline. The Kalama Lateral is integral to the operation of the NWIW methanol refinery. Greenhouse gas emissions from the construction and operation of the Kalama Lateral Project should be included in KMMEF upstream and construction emissions.

Thank you,
Diane L. Dick

Marian Gillis

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. Currently tankers abound full of oil all over the world. Currently an armada of oil tankers off the coast of San Francisco, sits and waits to unload fuel that we are not buying.

We have moved on.

Let's work together to create opportunities for our kids and grandkids!

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,

Ms. Marian Gillis

Kevin Clark

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

The draft of this second Supplemental Environmental Impact Statement (SEIS) clearly shows that this project is dirty, dangerous, and unwise. The refinery would use a staggering amount of fracked gas – more than all of Washington's gas-fired power plants combined – making it one of our state's most significant sources of climate pollution. Not only that, it would promote fracking in other US states and ultimately cause more methanol to be burned as fuel in China. Especially as the west coast faces roaring wildfires exacerbated by climate change, we must do better than more fossil fuels.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Governor Inslee stated, we cannot support such fracked gas projects in good conscience. You have a moral responsibility to protect public health and reduce our region's climate pollution. Please deny this project. We must invest in a livable future that is safe for everyone to thrive. Thank you.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

This refinery is a Chinese/Canadian energy export terminal; that's all it has ever been. It has never been about jobs or taxes, its about money and resources. The original backers of this refinery back up this analogy. BP and the Chinese Academy of Science. It falls in line with that saying, "Follow the Money."

Canada needed to monetize its stranded natural gas, and China needs the energy to supply its industrial capacity. Canada has no way to export its natural gas to world markets, and China always needs more cheap resources to power its economy.

If we let China export this vital limited capacity resource, we will lose our competitive advantage. America needs to charge more, not less for the gas than U.S. consumers, so that we are the ones making money and controlling our destinies-not China.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

Everything terrible about this refinery is facts, and everything good is speculations.

The facts:

It will consume large amounts of natural gas for decades, making it impossible to wean ourselves off this fossil fuel.

It will take 100 MW of clean hydro-power, which is like gold when it comes to GHG emission reductions.

It will consume millions of gallons per day from the Columbian Alluvial Aquifer.

It will produce a plume will be visible for miles, which will lower property values in the residential and business community surrounding it.

It will produce toxins that will add to the already large pollution bubble in Kalama. Industries, I-5 vehicle traffic, trains, and ship's cumulative adverse effects will have health impacts on the local population.

It will cause NW consumers and businesses to compete with China for natural gas capacity on the North West pipeline.

It will give Canada the ability to raise its natural gas prices to Washington and Oregon businesses and consumers now that there will be an export terminal to world markets.

It will make it easier for China to compete with American methanol producers located in the Gulf of Mexico if they get the Department of Energy Loan they applied for to help subsidize this refinery.

It will cause a lot of residents to lose their property due to eminent domain by a foreign company.

Speculations:

Jobs and taxes, and environmental considerations are all based on speculations.

Will China buy this "feel good" methanol in the numbers promised?

Will China really shut down already built refineries because this higher-priced methanol just because it will better for the planet?

Will there be a second train built for additional methanol production (Which is how they get to 200 permanent job numbers.) In an uncertain fossil fuel world, how could this refinery promise it will provide taxes and jobs decades into the future?

Will there be 1000 temporary construction jobs needed from this refinery that will be mostly built

elsewhere and just erected here.

Will there be only going to be locals working there? There aren't a lot of out of work refinery workers living in Cowlitz County. The company already said that 30-40% of the better-paying jobs would be brought in from other areas.

Edgar Meyer

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Merry Roy

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

We are responsible for acts now that will result in a more polluted future, worsening the effects of climate change for ourselves, our children and our grandchildren.

We are in the midst of a proliferation of fires in the western states, increasing strength of hurricanes, the rise of oceans that already have erased islands and driven Alaskans from their native villages, caused flooding/droughts in vulnerable areas resulting in huge numbers of climate refugees. God created this world and saw that it was good. We must take care of creation and not destroy his gift.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Merry Roy

Dorothy Knudson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We need to remember that creation is for all. We are all a part and our care of it is for ourselves and others. Some things belong to all of us...No matter what those with money and power say. It is up to us all to care for the gift our Creator has provided.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

Marilyn Cornwell

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. Fracked gas creates environmental havoc from the time it is taken from the ground to the time it is made into methanol, polluting air, land, rivers and communities all along the way.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

Rick Young

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. Not only a moral imperative but a practical one as well, as this summer's tragic fires, hurricanes and windstorms show. It is way past time to act, but we'd better act now to start rapidly reducing fossil fuel production and consumption for the sake of our children and their children.

It is the duty of the state government to protect our citizens before the financial and profit concerns of companies. I would rather pay higher taxes than pay the price of habitat and ecological destruction.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Diane Pasta

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

We must invest in a livable future that is safe for all to thrive. Washington needs to take leadership in protecting our environment for future generations. Building the world's largest fracked gas-to-methanol plant is a terrible mistake, and we don't want it anywhere, but especially not in our state!

We Quakers value stewardship and justice which this project would undermine, as indicated in the second Supplemental Environmental Impact Statement. Let's support our state's commitment to reducing climate pollution by rejecting Northwest Innovation Work's proposed methanol refinery in Kalama. Please deny its Shorelines Permit.

During the project's three reviews, it has had clear community opposition. Such fracked gas projects are against the interests of people in the state. It hurts our community's health and living environments.

Attempts to replace even worse polluters should not produce such damage in hopes of something unsure. We can find better alternatives.

Thank you for your voice in protecting the environment and the state's residents.

Peace,

Diane Pasta

Mark Uhart

The Washington Dept. of Ecology (Ecology) decision on the KMMEF shoreline permit is personal to our family. We were both born and raised in California but a military career took me away from the areas we love. My wife is a school teacher of 31 years and never stops learning and sharing information. In 2006, well before the proposed project was made public, we purchased land Southeast of Kalama with a beautiful unobstructed view of the Columbia River. We built a home on our lot and moved in during May 2015. Every day we are blessed with the view, relatively clean air, and neighbors who share our respect for the environment. We enjoy biking, hiking, walking and kayaking along this area of the Columbia River. My undergraduate degree is in Wildlife Biology for the Univ. of Nevada, Reno, and I maintain my knowledge base on environmental and local issues. I also enjoy wildlife and landscape photography and frequent the Port of Kalama Marine Park to photograph ospreys, eagles, and migrating waterfowl. I am an avid researcher and operations/business process analyst, preferring to analyze, synthesize and evaluate information in order to achieve a stated or implied objective. I also have a talent for identifying inconsistencies between different sources of information, such as the EIS, FSEIS and SSEIS for the Kalama methanol project.

My primary concern for getting involved in the review of the KMMEF project is its potential short and long term effects to our environment and climate change. Local construction jobs will come and go but the GHGs from this facility will be with us for over 100 years, and we have less than 20 years to bring global GHGs under control. The fires we are experiencing now will impact our state and local economy far more than the temporary construction jobs and any full-time jobs once the plant is operational. The GHGs emitted due to this plant will only increase ocean acidification and impact our fisheries, shellfish and salmon. (I didn't see any data-based analysis of the effects of ocean acidification and increased ocean and river temperatures in any of the EISs.) We must bring these GHGs, primarily carbon dioxide and methane, under control. This means that every country, to include ours, must reach zero net GHG emissions by 2040, nearly an impossible task considering the increasing human population. The KMMEF will accelerate global GHG emissions and climate change under any scenario.

According to the newly released United in Science climate change report, "The world is set to see its warmest five years on record – in a trend which is likely to continue - and (the world) is not on track to meet agreed targets to keep global temperature increase well below 2 °C or at 1.5 °C above preindustrial levels." The world is on track to increase global temperatures by at least 3.6 degrees Fahrenheit by 2050. The world weekly average of CO₂ in the atmosphere was 411.59 ppm on 9/5/20, an increase of 2.77 ppm over last year's weekly average for the same week. Ten years ago it was 387.59 ppm and the pre-industrial base was 280 ppm. The safe level for earth is considered to be 350 ppm, so we are already almost 62 ppm above the global safe level. We can expect average global temperatures to increase 2.7 degrees Fahrenheit over the next 20 years at our current rate of fossil fuel consumption.

The loss of state resources, private property and deaths due to wildfires must be considered in Ecology's decision. Poor air quality due to these extreme conditions, and the economic impact to our healthcare system, must also be taken into consideration. Climate change is partially responsible for extreme weather events and the longer and drier weather conditions. Now our wildfire season

can extend from May to October. For the last five years Western states have experienced increases in very large wildfires, resulting in loss of valuable state timber resources, loss of state and private property, and loss of life. As of this comment there are 15 active wildfires in Washington and over 600,000 acres have burned. What are the economic impacts of these events, locally and statewide? Will Ecology include them in a decision matrix and risk assessment for this project?

Lastly, Ecology's analysis showed that the KMMEF would produce 4.6 million metric tons (MMT) of carbon pollution every year, or 184 MMT over the 40 year life span of the plant. Our earth is at a tipping point and the only responsible course of action is for Ecology to deny the shoreline permit.

Mark Uhart
Kalama, WA

Goldie Silverman

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

I am a great-grandmother. I care a great deal about the world Isaac, my great grandson, will inherit. I want it to be clean and safe, but building the world's largest fracked gas-to-methane plant in Washington will not create that kind of world. This project will be dirty and dangerous; meanwhile we are ignoring other sources of power like wind and sun, that are cleaner, safer, and less expensive. Fossil fuels are limited; what will Isaac use when they are all used up?

When/if his world is locked into decades of climate pollution, dirty water, dead forests, I don't want him to look around at a devastated world and think, my great-grandmother let this happen.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms Goldie Silverman

Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Rev. Dennie Carcelli

Derek Benedict

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

It's very hard for me to accept that you want to continue killing our environment and ecology just so that millionaires can make more money at the expense of our planet.

Shame on you!

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Sheila Thomas

The smoke from the wildfires in the State have strengthen my concern regarding the methanol plant in Kalama and the impact of climate change. I believe it is imperative the Department take into consideration the long term effect this plant will have on the the environment. Several years ago there was a major fire at the local chemical plant, we live approximately 6 miles south of the plant. We not only had cinders, but ash from that fire in our pasture. I cannot imagine what would happen should a fire, emission leak, other other minor or major event take place and the impact it would have. Please, I urge you to consider all of the negative environmental issues this plant will have on such a beautiful location along the Columbia River.

Nancy Vandenberg

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. I am strongly against this project. for this reason. Any project that will increase greenhouse gases is irresponsible, The current forest fires are just one example of why we need to stop any project that will contribute to global warming and imperil future generations, as well as our immediate future.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. Jodie Galvan

Opposed to project - would prefer to see continued focus on transition to renewable energy. Also concerned about the impact of additional ships on marine mammals.

Ralph Myer

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

The draft of this 2nd Supplemental Environmental Impact Statement (SEIS) clearly shows that this project is dirty, dangerous, and unwise. The refinery would use a staggering amount of fracked gas – more than all of Washington's gas-fired power plants combined – making it one of our state's most significant sources of climate pollution.

Now, as the WA, OR, and CA face roaring wildfires exacerbated by climate change. Our global warming consequences are escalating!

We MUST do better than more fossil fuels

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Tess Morgan

I oppose this facility for the unrecoverable risk it poses to The Columbia River. Special interest and lack of respect for treaties and legacy of a "clean" river should have been halted before now. The risks far outweigh any benefits to the international proposal that disregarded local opposition. Please prevent further proposal development and implementation immediately.

Maureen Canny

Please stop the proposed Kalama methanol refinery. Consider the systematic cascade of dire health, environmental and economic consequences with a continued reliance on fossil fuels. Building yet another facility dependent on the dirty extraction of raw materials is unconscionable as the climate crisis unfolds so dramatically. We do not have time to waste with the same old arguments that lock us into fossil fuels. Please see past this nonsense. We have the technology to move to cheaper renewables now. Please consider ALL the negative externalities of the proposed refinery. Thank you.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

NWIW is a start-up company that is trying to build the world's largest methanol refinery, and the prototype that this refineries technology is based on is no longer in service and hasn't been in years.

The systemic lack of information to regulators and community members has been going on for years because they are going off the cuff and working out the details as they go along.

This Kalama methanol refinery is also a prototype in the sense that no methanol refinery in the world uses both ULE and ZLD technologies together.

The thing that concerns me the most is that if ULE was the most environmentally way of making methanol, how come there hasn't been another refinery that uses this technology in the decades that follow?

The articles below show how this played out in Tacoma, where the first methanol refinery by NWIW was to be built.

The Newstribune

APRIL 05, 2016 06:31 PM , UPDATED APRIL 07, 2016 02:35 PM

Proponents of a \$3.4 billion methanol project on the Tacoma Tideflats do not plan to meet with Port of Tacoma commissioners before an April 25 vote on its lease.

Last week commissioners said they wanted Northwest Innovation Works to justify why it wanted an extension of the feasibility period of its lease.

However, company officials told the port that nobody is available to talk with the commission this week, said port spokeswoman Tara Mattina. After this week, there are conflicts in commissioner and port executive calendars.

"To me, it means they've lost interest," said Port of Tacoma Commissioner Don Johnson. He said he likes to take time to consider a vote. "From my perspective, I don't see myself making a decision on the 25th that benefits them."

The port commission approved the lease with Northwest Innovation Works nearly two years ago. The lease includes several phases, one of which is the feasibility period.

Without an extension in the feasibility period, the China-backed company could pay hundreds of thousands more dollars per month than its current \$8,000 monthly terms. It would also lose the ability to back out of the lease if the feasibility period expires.

Commissioner Dick Marzano said Tuesday that he is "disappointed" in the company's decision and "skeptical" of anything the company might promise on April 25.

"I'm quite disappointed, to be perfectly frank," Marzano said. "... This has been the focal point for such a long period of time, and rightfully so. It's hard to go any further."

Commissioner Don Meyer said earlier this year that he wanted to give the public ample time to view any changes to the company's lease before a commission vote.

"I've slowly reached the conclusion that we have a faulty lease no matter what happens on the extension period," Meyer said Monday.

Company president Murray "Vee" Godley has presented to the port commission a few times on the project. Meyer said Godley's lack of availability this week has put the company into a difficult position: "His burden, not necessarily ours."

Last week commissioners said there are more questions than answers related to the methanol project, and Northwest Innovations has had nearly two years to answer them.

Commission President Connie Bacon said Monday, "There are so many things (I'd like to hear) that it's hard to pick from. The community has asked a lot of questions, and so far there have not been specific answers. And I hope they come equipped with some answers."

Bacon said if the commission denies an extension of the feasibility period, the company has five days to either terminate or move on to the so-called "construction phase," where it will pay hundreds of thousands of dollars more per month.

Tacoma methanol project canceled

By Kate Martin

APRIL 19, 2016 06:01 AM , UPDATED APRIL 21, 2016 10:00 PM

"As the process continued, it became increasingly clear the community was frustrated by the lack of answers on important questions," the spokeswoman, Jaime Smith, wrote in an email. "Jobs matter, but so does our commitment to safety, clean air and clean water."

"The commissioners' views of the project's backer had soured in recent weeks. Several commissioners had expressed frustration at the lack of information they were getting from Northwest Innovation Works. Commissioner Clare Petrich said the commission had been waiting too long for answers to basic questions."

"You cannot expect them to go on without providing that kind of information forever," she said last month.

Earlier this month, some commissioners said they were skeptical the company could persuade them to vote for the extension, given the lack of information.

"They could give us any kind of schedule they want, but who's to say it would be accomplished or done?" Marzano said. "I don't know what they've done — that's the thing. I haven't heard one thing they have done yet."

How Tacoma's methanol debate went sideways, and what we can learn from it

By Matt Driscoll

APRIL 23, 2016 04:00 AM , UPDATED APRIL 26, 2016 09:47 AM

The methanol conversation reached its nadir because some suspected the public process was stacked against average citizens, the company behind the would-be refinery failed at nearly every opportunity to provide even the most basic information, and people wanted answers to legitimate questions and they just couldn't get them.

"There was a tremendous amount of fear and frustration," Mello observed, in what might be the understatement of the year.

In this vacuum, the conversation went sideways. That's not absolving anyone's behavior, it's seeking to understand what happened beyond simply pointing fingers at the public from positions of power.

"I think the temperature in Tacoma, the outrage, was more intense than I've seen anywhere else. And I actually think some of it was justified," Eric de Place, policy director at the Sightline Institute, offered. "The problem I think is, with a lot of these projects, the existing power structures we have all seem to kind of bake in the outcome, right from the beginning. ... To an ordinary community member, it can seem like they're getting railroaded."

Lucinda Schaures

The project would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year.¹ This is unacceptable for our beautiful Northwest, our nation, and our world. We definitely need to make our environment safer and not detrimental to our children's future. Please don't allow this project to proceed.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

We cannot depend on this ULE technology to be the cutting edge way of reduction of GHG emissions for the next 30-40 years. In 10 years, this refinery might be the most polluting in the world.

Any kind of assumption that this will displace future better-designed methanol refineries is not reasonable.

The next step in "green" methanol is already happening in other parts of the world. Super Low ULE might be a technology that might be only a few years away.

Accelerating Shifts in Power Generation & Transmission
18 September 2020 @ 03:30 AM

It said China has been gasifying coal to produce methanol and then petrochemicals at very low prices but India must use green methanol instead of methanol.

"India imports a majority of its methanol demand, as the domestic production units primarily rely on imported natural gas. Natural gas is reformed to syngas which is further converted to crude methanol in a reactor," CEEW Programme Lead, Tirtha Biswas told ETEnergyWorld.

The green methanol process, on the other hand, combines green hydrogen and CO₂ gas stream either from industry emissions, biomass, or direct air capture to produce methanol.

According to CEEW, the use of hydrogen, derived from electrolysis using solar or wind (hybrid) power, is likely to become as competitive as conventional fuels.

The technology would involve an electrolyser producing hydrogen using renewable electricity and CO₂ captured from the air to produce syngas, a feedstock for green methanol production.

"An alternative green methanol-based production process, provides opportunities to replace natural gas with water, and utilise CO₂ emissions from other industrial processes to produce methanol with zero carbon emissions," the policy brief said.

The green methanol process for manufacturing petrochemicals is likely have lower cost when compared to both natural gas and coal-based production processes by 2030.

With the petrochemicals sector seeing an increase in demand for more products, it is imperative for domestic policies to address the levers that can catalyse a transition towards sustainable manufacturing, according to CEEW.

Solar methanol islands – opportunity or threat?
Emilia Obłuska

18 July 2019

Researchers have come up with what they called 'solar methanol islands'

Such islands drifting in ocean waters would, using solar energy, bind carbon dioxide from water with hydrogen obtained at the station and produce methanol – a slightly more environmentally friendly alternative to commercial fuels, eg gasoline.

Jul 31, 2020

Green Fuel On The Horizon - Achíni Green Crude

James Conca

The products of combustion – CO₂ and water – can be recombined using clean non-fossil energy, like wind, to re-cycle CO₂ and make the same chemical fuels, like kerosene, gasoline and natural gas. That's a closed carbon cycle, because the waste of the burned fuel becomes a feedstock for the future fuels.

Among the many products that are possible from the combination of carbon dioxide and hydrogen, Achíni's Green Crude using the Fischer Tropsch process can provide heavy paraffins for waxes and lubricants, olefins for making plastics and textiles and all of the other synthetic materials we use, making them green as well and removing them from the carbon cycle, so also carbon-negative

The technology for pollution reductions is already being retrofitted on pre-existing coal-fired power plants in China and Saudi Arabia.

Satellite verification of ultra-low emission reduction effect of coal-fired power plants

Atmospheric Pollution Research

Volume 11, Issue 7, July 2020, Pages 1179-1186

Verification of ultra-low emission (ULE) reduction effect in isolated power plants by satellite.

The reduction of satellite data is consistent with the emission reduction of power plants before and after the ULE. Satellite observations have confirmed the emission reduction effect of ULE technology.

. The SO₂ and NO₂ satellite images exhibit that there is an obvious concentration gradient between the high-emission zone where the isolated power plant is located and the surrounding area, all of which show the characteristics of approximate large-point source emissions.

Ultra-low NO_x burners in methanol plants

Recently, the Kingdom of Saudi Arabia's (KSA) strict environmental regulations have required operators to replace older, previous generations of burners with the latest in ultra-low NO_x technology.

.

Teresa Flynn

Washington Dept. of Ecology, I am a resident of Kalama. Wa , where NWIW. is proposing to build the largest Fracked gas To Methanol Refinery. This would some much pollution it would increase The Climate Change on Earth. Dont consider any further permitting of this project.. No Kalama Methanol Refinery Thank you

Christina Wolfe

I do not support this project and urge Ecology NOT to allow this project. We need to be investing in industries that reduce climate pollution, NOT increase it.

james lombard

This project is a very bad idea from the start. Science tells us that this is a polluting factory that only contributes to climate change, and chemicals in our river that spawns salmon in the northwest. Please say no to this project.

Debbie Tomasovic

I am fearful for our future, if this plant begins producing all of the pollution it is predicted to produce. Let's not continue to be part of the very problem we are needing to solve. The health and well being of our citizens and planet are at stake. Washington cannot contribute to the goal of keeping global warming "well below 2 degrees Celsius" by allowing major polluters to move forward. A low-carbon future demands investment in lower-emitting production processes.

Debbie Tomasovic

We know better, we can do better. We need to focus on clean energy sources that do not continue to pollute our air and worsen our climate change impacts. Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year. Combustion of the full methanol production capacity of the plant would generate 5 million tons of pollution each year.

Debbie Tomasovic

Clean energy sources are part of our solution to climate change. Ecology fails to consider whether cleaner energy technologies may dramatically displace the need to use methanol for transportation fuels. Conversely, Ecology's analysis fails to consider how dumping high-polluting methanol into the market could negatively impact a transition to cleaner transportation alternatives and vehicle electrification.

stephen shubert

Aren't the current fires enough to discourage building carbon spewing plants? We need to shut down hydrocarbon - all of it - as rapidly as possible. Do not build this plant.

H Thom Pence

If there was any doubt before that the Kalama project was a huge smoke screen for corporate greed rather than environmental safe-guarding, then this latest environmental document should erase that notion. From the disastrous effects of fracking, to the multiple opportunities for increased methane leakage, to the overall increase in Washington State's pollution, to the incredibly dubious assertion that this activity in Washington will miraculously eliminate worse pollution in China, this latest attempt to circumnavigate good science with thinly veiled greed and misplaced optimism is surely it. When projects should be actively pursuing net zero green house gas emissions the Kalama project merely overlooks the real problem of added pollution in favor of crystal ball logic! This is not what the world needs and definitely not what Washington State needs nor wants! The Kalama project is merely another nail in the world's biological coffin that would ONLY serve to enrich energy companies at the expense of life on this planet. I strongly stand against such a thinly veiled attempt to further degrade our biosphere in the name of profiteering!

Roseann Thomsen

Residents of SW Washington are not in favor of this plant. It is dangerous on so many levels: to the air, the water, the people, and the animals in this region. It is a bad idea and will only benefit a few. Why risk the health and welfare of local Washingtonians for the benefit of people who do not live in the area? It is not worth the risk. It wasn't so long ago that we tore down a nuclear plant right across the river. At one point, people thought nuclear power was the answer. We know hindsight is 2020, and especially this year it seems critical to carefully consider every environmental and monetary impact.

My family and I urge that this plant does not get approval.

Thank you for your complete review of all the facts surrounding this issue.

Roseann Thomsen

Joy Greenberg

I am opposed to moving forward with a Methanol plant in Kalama, WA. The risk to our environment, whether short-term or in the long-term is much too great and far outweighs any attempt by NWIW's to try to mitigation the hazard. The environmental risk to our community and our waters far outweighs the position that NWIW's plan will bring in local job opportunities. I stand strongly opposed. Joy Greenberg, Local Resident

Genevieve Shank

Don't allow the world's largest fracked gas-to-methanol refinery to harm our climate and Kalama!

Washington State should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama, WA.

The project would use more fracked gas than all of Washington's power plants, combined. The company has sought to mislead regulators and the public about the purpose and impact of the refinery, falsely claiming that the project will displace "dirtier" forms of fossil fuels. We know that fracked gas is a potent greenhouse gas pollutant, and we are counting on Ecology to accurately account for the project's upstream emissions as well as the downstream pollution from the likely combustion of NWIW's methanol for fuel.

For the community of Kalama and for our climate, the risk is simply too big. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution. We are counting on you to stop this dirty and dangerous project.

kirk Leonard

I have lived in Kalama for many years and the people of this town deserve better than a dangerous, dirty refinery for the promise of a few jobs.

We need to invest in a clean future, not get fooled by desperate companies refusing to recognize that fossil fuels are not the answer. We are in a climate crisis, adding more fossil fuels will hinder the transition to cleaner energy technologies.

I am against this refinery because I care about my neighbors and I care about the future.

Please deny the Shorelines Permit needed for this project to continue forward.

Bill Baumann

I am strongly opposed to this project. Please do not approve it. If you have any doubts about climate change, this year's wild fires and accompanying smoke events should give you some idea of what our future will be like, unless we stop burning fossil fuels. Please take this seriously. It is crazy to approve this project at this time.

Nina lebaron

No matter how many environmental reviews are conducted, the science still tells us that the proposed Kalama refinery is a very very bad idea for our planet, our state, and the waters of the Columbia River — the river that gives life to the salmon who, in turn, feed our starving orcas.

Ecology's new analysis reveals that the Kalama refinery would cause significant additional GHG emissions from start (fracking in Canada) to finish (burned as fuel in China) — making it one of Washington State's largest sources of climate-changing pollution. This refinery would use more fracked gas than all of Washington's gas-fired power plants combined!

Anyone who wants to breathe clean air would say NO to this project. And yet, relying on smoke(!) and mirrors, the backers (the Chinese government-owned company NW Innovation Works) are claiming that if we don't do the polluting, then someone else will and they will pollute even more! How about NO polluting by anyone? We Washingtonians will not be duped into paying for this project and becoming climate disaster enablers! The whole West Coast is burning right now due to Climate Change- HELLO? Do you not care that we are living in an Apocalypse right now, the red flags are waving, we can't take it any longer! We must switch to safe, renewable energy sources now, and hope the damage can be reversed.

Nancy Mogielnicki

Re Kalama: In this era of climate emergency I believe it is disastrous to build a plant which relies on transported methane (given information about leaks and role of methane as a greenhouse gas). Whether the methanol will be used for plastics or fuel doesn't matter; both are injurious and we must transition to other materials.

Julie Zanzi

I live in Ridgefield WA and I am vehemently opposed to the Kalama Methanol facility at the Port of Kalama. It is very short-sighted to propose an industry that will forever negatively impact our environment for future generations and in return create a few hundred jobs to provide methanol to China for plastic. Please do not approve the permit to allow this facility to operate. Thank you, Julie Zanzi

Cathryn Chudy

An opinion editorial in the SW WA Columbian Newspaper on 9/9/20 pointed out that: "97% of peer-reviewed climate studies have concluded that human activity has contributed to global warming." ("Reminder of Climate Change Blows Into County" 9/9/20).

The hazardous air we are currently breathing from out of control wildfires sweeping through our state and the West Coast puts all of us at severe risk. The editorial offers this prescription: "a drastic reduction in the burning of fossil fuels" that is the key to keeping us safe and healthy, our community habitable. This editorial speaks to the "broad effects of climate change" which I see as relevant to whether or not this proposal gets permitted, and can be found at:

<https://www.columbian.com/news/2020/sep/09/in-our-view-reminder-of-climate-change-blows-into-county/>

The toxic air we have been pulling into our lungs this week is one of the reasons why so many of us resist when we are asked to follow the smoky yellow brick road north, to the mythical land of OZ (Kalama, WA) where a proposed methanol refinery and export facility will turn fracked gas to methanol for export to China. Allegedly, (promises the Chinese company behind the curtain, NWIW) their operation will "save" the world from rising greenhouse gas emissions.

We cannot afford to believe everything we hear from the company that lies repeatedly to regulators and the public, inducing the Port of Kalama and Cowlitz County to put an international company's profits over the health, safety and long term viability of the river corridor that we all love. The company lied to the public and regulators about end use being only for plastic production in China, for example. This turned out not to be true, and now fuel is included in end use scenarios for China.

The Department of Ecology required this second SEIS and it is worth noting that as the state regulator you do not have to be influenced by the conflicts of interest reflected in the Port of Kalama and Cowlitz County's blatant push for this proposed fracked gas to methanol refinery and export terminal (both the County and the Port receive money from this company.)

The only way we are going to protect our region from the increased intensity and frequency of these destructive wildfires (and the toxic air/pollution that comes with them) is to keep fossil fuels in the ground. We are NOT going to do this by saying "yes" to increasing levels of greenhouse gases and pretending that a dishonest company long on promises and short on anything else but pursuit of profits will somehow magically "mitigate" these away. The SEIS shows a "voluntary" mitigation framework that has little to no detail on how mitigation, if pursued, will be accomplished. As a state agency representing the public which will experience the pollution impacts for decades to come, that is simply not good enough.

Your Dept. Of Ecology mission to "we the people" who live here in our state is "to protect, preserve, and enhance Washington's environment for current and future generations." Permitting a proposal that does the opposite is not acceptable, and constitutes an unconscionable betrayal of that mission.

This is a bad bargain for Washington and our children's future. Please listen to us and say "NO" to permitting this project.

Diane Dick

Re: Formal Comments on Kalama Manufacturing and Marine Export Facility Draft Second Supplemental Environmental Impact Statement, September 2020

Please deny Kalama Manufacturing and Marine Export Facility (KMMEF) a shoreline substantial development and a conditional use permit. The environmental impacts from the project are significant and cannot be mitigated.

Greenhouse gas emissions are insufficiently explained in the draft second supplemental environmental impact statement (SSEIS) and the data contains errors and omissions.

Upstream emissions are based on speculative and incorrect information.

To begin, over 99% of the natural gas feedstock source for upstream emissions is assumed to come from British Columbia, specifically the Montney Formation (FSEIS Appendix A, p. 41).

Fort St. John, BC, centered in the formation, is located 964 miles north of Kalama, WA.

The gas transmission pipelines map, Figure 3.4-1, labels the pipeline distance to the BC gas source as 629 miles. Clearly this is incorrect. The distance to a Wyoming gas source is likely similar or shorter.

The assumption the feedstock gas will be sourced in British Columbia is unqualified and speculative. The KMMEF SEPA Final Environmental Statement 7.3.2 states, "At this time, NWIW has not entered into contracts for the supply of natural gas to the proposed project." There has been no report this has changed.

The cascade of errors in upstream emissions continues by using the GHGenius modeling tool for life cycle analysis with questionable results.

As noted on SSEIS p. 40, "In the First SEIS, the GHGenius model was used to estimate upstream emissions for natural gas from BC (S&T Squared 2013). The GREET model was used to provide estimates for the U.S. Rocky Mountain natural gas source (ANL 2017)."

The GHGenius model used in the first GHG analysis is outdated (highly revised edition 5.0 released in April 2018) and apparently does not provide the same output data for transmission emissions as the GREET model. This is apparent in comparing the transmission emissions for the BC gas source and the WY source.

Table A-2 Low Emissions Scenario in Appendix A compares the emissions data from the GHGenius model for BC gas with the GREET data for North American gas. It uses GHGenius data from the first GHG analysis. While the data is like that presented in the first analysis, some

categories have been combined which blurs the source of some of the emissions, particularly those from pipeline transmission. Transmission emissions, fugitive and storage, appear to be almost three times the value given for BC transmission emissions.

The KMMEF SEPA Final Environmental Impact statement provided a description of factors in determining upstream emissions. "Natural gas extraction involves the operation of compressors and separation equipment at the wellhead and gas processing facilities. Figure 3-8 shows the upstream emissions pathways for natural gas. GHG emissions are calculated based on the energy inputs from aggregate data, which are inputs to the GHGenius and GREET models. The models calculate the life-cycle emissions, including the upstream emissions, to produce fuels for gas extraction and processing. The GREET model also calculates energy inputs and emissions from compressors used for natural gas transport and includes provisions for fugitive methane emissions at all stages of the extraction and transportation processes. These models do not include emissions associated with the preproduction phases of the upstream emissions (natural gas well development) and emissions from this phase are not included in the calculations as no well development is attributable to the proposed project." FSEIS 3-17 [emphasis added]

By omission, this statement implies the GHGenius model may not include all the emission factors included in the GREET model, which could explain the greater emission rate yielded by the GREET model for North American gas.

Emissions from pipeline transmission in the GHGenius model for BC gas are insufficiently calculated, producing an inaccurate emission rate for upstream emissions. As previously noted, the pipeline transmission distance from Kalama to the BC gas source is incorrect. Pipeline distance matters in determining emissions. As stated in Appendix A of the SEIS, KMMEF Supplemental GHG Analysis, 2018, p. 29, Natural Gas Transport- "Natural gas fueled compressor engines compress and move gas along the pipeline network...Natural gas flows through a pipeline at constant pressure and the pressure drops as gas is removed from the pipeline and due to pipe friction. As more gas is moved through the pipeline, additional compression energy would be required to move the gas, which is part of the upstream analysis." [emphasis added] Additional compressors needed on longer pipeline routes require more energy and increase fugitive emissions.

This raises doubt about the reliability of the GHG emission rate produced in the first GHG analysis and used again without correction in this second analysis.

In the first GHG analysis the upstream emission rate of 0.71% calculated 0.2848 tonnes CO₂e per tonne methanol for BC gas feedstock and 0.3403 tonnes CO₂e for North American gas, and possibly more. The baseline and market mediated rate were determined to be 0.289 tonnes CO₂e/tonne methanol.

I believe these numbers are unreliable and low-balled. However, these numbers are brought into the second supplemental EIS uncorrected where they create a cascade of dubious conclusions. The 0.71% emission rate and 0.288 tonnes CO₂e/tonne methanol are now considered 2nd SEIS low values. (SEPA 2nd SEIS, Sept 2020, p. 82) An upstream methane emission rate of 0.97 percent and 0.333 tonnes CO₂e/tonne methanol, or the middle value, is considered more plausible. SSEIS, p. 80. This is the emission rate the EPA Shale GREET model produced for North American gas, Table A-3 Medium Emissions Scenario SSEIS.

While the plausible upstream emission rate is 0.97 percent, the analysis of alternate pathways for methanol imports to China sets KMMEF upstream emission rate at the low and questionable 0.71 percent. See Table A-7 where the GHG emission from upstream is set at 0.289 tonnes CO₂e/T methanol, corresponding to the 0.71 percent emission rate. To further skew this input in KMMEF's favor, this same value is assigned to all other reviewed methanol producers.

The reasoning given is, "A key distinction in how the ESM handles emissions from this pathway compared to China-based natural gas methanol, is that upstream emissions related to natural gas extraction and processing is set equal to that of KMMEF. This assumption was made based on the lack of emissions data from the methanol exporters evaluated in this study and the uncertainty around upstream methane emissions from natural gas extraction and processing (Gan et al. 2020)." SSEIS, p. 62. [emphasis added]

Incongruously this statement follows the statement in the previous paragraph that, "The difference in life cycle GHG emissions is mostly due to upstream natural gas emission rates and the difference between KMMEF's ULE technology and the combined reforming technology used by some of the 29 existing facilities. To a lesser degree the emissions difference is attributed to electricity and transportation emissions. The lifecycle GHG emissions of imported methanol may decrease over time as new facilities come on-line using ULE technology or even newer processes."

Table A-7 compares other global producers to KMMEF using the same implausible upstream emission rate despite acknowledging much of the difference in life cycle emissions is due to upstream emissions. The low upstream emission rate attributed to KMMEF British Columbia gas feedstock compared to other producers seems more unrealistic considering BC gas will be transported and emitting along almost a thousand miles of pipeline compared to methanol producers on the Persian Gulf in Iran sited less than 100 miles from petroleum reserves ranking in the top five globally.

Further analysis based on data with such inaccuracies and unjustified assumptions on upstream gas emissions would seem an exercise in futility.

KMMEFF should be denied permits based on the multiple verifiable analyses the refinery will produce millions of tonnes of greenhouse gases in Washington.

Thank you,
Diane L. Dick
Longview

Gianna Zanzi

To whom it may concern,

Hello. My name is Gianna Zanzi, I'm 21 years old, and I wanted to briefly offer my perspective and opinion on the proposed Kalama Manufacturing and Marine Export Facility. I'm currently writing you from my home, where I'm sitting in the state-deemed hazardous air from the ongoing Oregon wildfires, and missing the clear and blue skies that I once took for granted. Beyond the clear hazard that the Kalama Manufacturing and Marine Export Facility poses on not just the city of Kalama, but everywhere that the menthanol passes as it moves overseas to be made into plastic, I'm worried for what this facility might mean moving forward for future generations. If built, the menthanol manufacturing facility would introduce unimaginable amounts pollution into the air, as well as add more unnecessary contamination to the Columbia River through to the Pacific Ocean as it moves halfway across the world to be turned into plastic. What really is it all for? To add more plastic to the world and fuel to burn, while we're direly looking for solutions to reduce the impact that plastics have had on our environment for the past sixty years? To add more cash into the pockets of people who will never feel the effects of the the pollution that they've caused?

When the decision is made in regards to the proposed Kalama Manufacturing and Marine Export Facility, I ask to please consider the people that it would affect, and the blue skies that we take for granted.

Best,
Gianna Zanzi

Elizabeth von Dassow

I am completely against the Kalama Refining and export facility that is planned due to the ecological (negative) impact. We are suffering already from the effects of climate change in this region, from wildfire smoke and dying orcas (i.e. economy) to altered food growing abilities and uncharacteristically hot summers. We don't need more climate change, which is what this plant will do, and in a very big way. We need solutions. I cannot, in any way, support this project.

Teresa Flynn

I Encourage the Department of Ecology State of Washington To deny the NWIw application. The facts are the project would add a total of 3.6 million metric tonnes of green house gas emissions per year .This is totally unacceptable. We as citizens of Kalama insist you deny the proposed project.

Edward -1-Ned-1- Piper

Ladies & Gentlemen,

I wish to see the Kalama Innovations project proceed to completion. I strongly believe that the management of this project have operated in good faith and with the best interest of ecology and the local economy. Thank you for allowing me to speak.

Leslie Marshall

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We are all part of an interconnected web of life, and so are bound to care for this earth since it is the only home that all living things have. As we see in the news every day, the not-so-slowly changing climate - fueled by steady increases in greenhouse gas emissions - is devastating to the health and well-being of communities all over the earth.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Dr. Leslie Marshall
1866 Commodore Ln NW Bainbridge Island, WA 98110-2628

Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms. Kalama Reuter
920 NE Fields Ave White Salmon, WA 98672-0440
kalama@embarqmail.com

Lynn DeBroeck

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We must move past forms of energy that are harmful and add to the already devastating effects that climate change is causing. This project is a moral outrage and just because we can do something does not mean we should. The consequences to our future must be taken in to account and this plant would cause further harm to future generations by contributing further to climate change. The risks to the local environment are not worth the profits these investors are looking to make only for themselves.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. Carole Onasch

We are experiencing Severe fires and Drought here in the West and world wide. Does the Planet Need a Methanol Refinery!?!? It would manufacture a component of plastics. Does the Planet Need more plastics?!?

We are experiencing mass Bio Diversity Loss....Climate Breakdown....Ecological Devastation! Is the solution to these horrible truths the Kalama Methanol Refinery? No matter how the proponents "Spin" the info..."like the Trump admin", Any Infrastructure...Any at all to do with Fossil Fuels is Devastating to all of life on our Planet. I write this as The West is swirling in Pain from Historic Fires. Portland Air Quality Index is high scale Hazardous....Need more be said?

Staci Mangan

Please do not do this to our beautiful community. We do not want to support China in any way. We want our air and rivers to stay as pristine as possible. We want the world to move away from plastics, not enable the continued use. Our landfills are already full of it. Please help to prevent the shoreline permit as we can not sustain this kind of pollution.

Kerry Fitzgibbons

I am commenting on the impact of Kalama Manufacturing and Marine Export Facility. (1)The source of the product to be handled and shipped is of high damaging to the environment of the area where it is mined by 'Fracking'. (2) The Columbia river is a vital natural resource that is already stressed by ocean going shipping between the coast and the port of Portland. Establishing a petroleum based processing and shipping facility on the Columbia threatens the entire waterway with pollution, predictable spill hazard. The Salmon runs up the Columbia are already in jeopardy due environment intrusions and mismanagement. The Trojan Nuclear Power Plant was removed due to the damage it caused to the river environment by raising the water temperature; this facility will have much the same impact on this valued and at risk waterway. Do not permit this facility to be constructed and operated in this location.

Kathy Turner

I am voicing my profound protest to the the approval for and establishment of the Kalama Methanol Export Facility. I join our governor in his rejection of said proposal. Washington state (or any location for that matter) does not need to host the world's largest methanol production plant, and the numerous dangers it would pose: a) such as those of the pipeline from Canada (leaks and ecological disruption), b) the storage of millions of gallons of flammable liquid at the facility (leaks, explosion and fire-a disaster waiting to happen) and c) the threat of tankers sailing the Columbia (leaking-polluting the waters and shoreline, or colliding with other ships or boaters).

James MacLeod

As a Kalama resident, I am very concerned about KMMEF plans to "mitigate 100 percent of all in-state direct and indirect GHG emissions." The Final Supplemental EIS dated 8/30/2019 was a cruel joke. Buried in Appendix C, the so-called plan called for a loosely-defined committee of stakeholders with no specific authority, funding, timetable or accountability. Now the SSEIS draft dated 8/10/2020 (Appendix D) does little to improve this charade. The "Voluntary Mitigation Program Advisory Board" still has no specific membership, no implementation date, and the accountability still lies with Cowlitz County and DOE -- which they would in any case. There are no more specifics about proposed mitigation actions other than the purchase of carbon credits, which won't do a thing for Kalama residents. Even footnote 41 on page D-2 is specious: "NWIW is undertaking research as to how to configure and account for the VMP, including the consideration of forming an independent nonprofit arm to administer the funds." That independent C-4 might insulate NWIW from financial liability, but does nothing for the rest of us. Why would you want this in your backyard? KMMEF should be shelved unless and until specific mitigation actions are defined with hard dates and authority. Otherwise, Kalama residents will be stuck with whatever GHG emissions are produced.

Rick Rappaport

You are as close to a fact gathering/decisions made on facts organization as we have remaining in this country. And as such you all have an enormous responsibility.

Every "source" of information from company based decision making has baked into it the need to monetize results. In our world a tree is worth more dead than alive as are whales.

You do not have that kind of requirement. You can weigh all information—you're actually duty bound to do this—against your mission for existence: "Protect, preserve, and enhance the environment for current and future generations.

and determine if you're doing the right thing.

If I want a permit to build something that contravenes your mission for existence you have to deny my application even if I dot all i's, cross all t's and glom on to some part of some definition that colorably makes my application seem reasonable.

That is your duty and I don't envy you taking on that responsibility. Fulfilling that responsibility means deeply disappointing someone or some group or some thing you are personally connected to and/or that moves the needle in your heart.

It's pretty much an impossible task but you have a mission statement for a reason. It exists so you will not lose sight of what is really at stake in your deliberations. Are you meeting the goals you've stated enfranchise your actions?

People come to you—you come to you-carrying "facts" you've gleaned from sources. But what source can truly be trusted? Facebook and google searches will funnel you-individually, person by person- to whatever will keep you engaged on your search device because that's how your "research" is monetized.

Weigh what you're hearing not by the scale of your own biased sources or personal biases but by what makes common sense. Yes it's all so difficult to accomplish this now, in these polarized times, but you have the freedom to act like a human being tied to this Earth, this life and your children's lives.

Then do the right thing.

kathy wesley

I oppose this project for all the environmental reasons being discussed. Jobs are important but not with the environmental degradation.

John Zanzi

Opposed to Kalama Methanol Plant

I am opposed to the construction of the methanol plant in Kalama. We should not be creating pollution that will impact locals in order to strengthen the Chinese economy. Even if it is true that it will reduce pollution worldwide (which i do not believe) it will certainly increase pollution in the US and SE Washington in particular. No pollution here to help China create unwanted plastic.

Carolyn Atkinson

My name is Carolyn Atkinson and I am a childcare worker at an elementary school in Seattle. My students understand that they are growing up in a world in crisis. I prepared these comments under the smoke of the homes of Oregon's 500,000 American climate refugees.

My students are anxious. I am anxious. I am 25 years old. The most terrifying impacts of climate change are projected to hit us within my lifetime. Before the end of the century, CO2 levels are likely to rise to the point of impairing human cognition. This methanol plant is going to pump millions and millions of something that in these quantities is no longer just a driver of the greenhouse effect but a toxic threat to our brains' own ability to problem solve something better. The SSEIS fails to account for the predicted cognitive impacts of CO2 in the local atmosphere, the effects of which will no longer be negligible before this plant is out of service.

The Kalama plant is justifying itself with the ridiculous logic that somehow, over the next 40 years, this plant will emit less than hypothetical other plants. This is an absurdity. The next 40 years are so unpredictable that a majority of my generation has agreed that we won't even bother to plan for retirement because of the scale of chaos on our horizon.

The instability of the future that breaks the flimsy 40 year logic of this environmental statement is caused by the climate crisis.

The instability is caused by fossil fuel expansion.

The instability is caused by projects exactly like this one.

The instability of this exact project is caused by this exact type of project.. It is indefensible to think that somehow, this time, it's going to be a net good, when this has never been true once in the last 40 years of fossil fuel expansion.

It's a ridiculous proposition to build and a terrible investment. It is a crime against my personal health and safety and the health and safety of my students, their families, and their home nations across the planet to consider accelerating the destruction of our futures.

Protect, preserve and enhance the environment for current and future generations. Deny the Kalama Methanol project and impose rules to prevent the possibility of repeating this deadly mistake in the future.

Bruce Garberding

please stop this refinery in WA state...it is dangerous and unhealthy.

Rory Cowal

Dear Director Watson and Department of Ecology:

Today I am urging you to reject the proposal to build a refinery that would present a great risk to our communities and a huge setback in our efforts to reduce greenhouse gas emissions.

I live just across the Columbia in Portland OR. This has been an extremely difficult week for my family; we are experiencing first-hand how events fueled by climate change upend daily life. We grieve for the homes and lives lost to wildfire and we worry about our own health. By any measure, the quality of life in the Pacific Northwest is determined by the health of the land, the air, and the water. The oxygen we breathe, the food we eat, the natural places we go to boost our wellbeing and spend time with family and friends: none of these things are guaranteed to us or future generations unless we take care of our planet. This proposed methanol refinery guarantees one thing for people in the northwest: decades of pollution at an extraordinary cost and an enormous setback in the region's efforts to combat climate change.

To accomplish the very goals of the Department of Ecology—to protect, preserve, and enhance Washington's environment for current and future generations—the state of Washington must transition off fossil fuels and begin fighting the climate crisis at the scale that scientists say is necessary. For my family, for your family, for the sake of our legacy to the next generation, I am calling on you to reject the methanol refinery, and to deny the Shorelines Permit for the project.

Thank you,
Rory Cowal

Nancy Hansen

Greenhouse gases have to go down, not up. By allowing new facilities to do the same old thing, we will never get to a place to meet goals required to survive. The people at Kalama have told you what their city is like with having to breathe air only due to the processing. Just think of plastics that will be produced with the export of these fuels. No more. We are not handling plastic wastes and there is no prospect of doing this because they do not break down. No company wants the job of dealing with this. Then, go to fracking itself and use of gallons and gallons of water to extract, contamination of groundwater near these wells, the fact new ones have to be started in order to extract more. Not a sustainable way to use our earth's treasures. Everywhere I go people are seeing the nightmare happening around them. Young people are the victims. This has to stop now, and at the source, which is decisions on approval or not. You have total responsibility for this decision. Please do it for all of us, not for corporations that aren't even going to be able to continue much longer anyway. We have all put up with too much destruction for far too long. Get the balance back. Thank you.

Brian Duncan

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

It's long past time for Ecology, and all of us, to choose a more sustainable path. The proposed methanol plant must not be permitted and built, and instead, sustainable energy and materials projects must be supported. The current climate change exacerbated fires underscore the urgency of the needed transition to renewable energy, and away from fossil fuels.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Mr. Brian Duncan
7307 21st Ave NW Seattle, WA 98117-5624
beduncan@earthlink.net

Jean M. Avery

As we are acutely aware, Northwest residents have been bombarded by very unhealthy smoke recently. According to Ecology's ratings, the air quality in SW Washington has been hazardous to our health. And according to the website, IQAir.com, Seattle and Portland recorded the worst air pollution in the world!

Located between these two cities is Kalama, where an international company wants to build the world's largest methanol refinery. As proposed, this plant would be operational for 40 years, producing massive greenhouse gas emissions that would adversely impact Washington's air quality, while also undercutting efforts to curb emissions globally.

So, why would we invite more pollution into our region? This year's Covid crisis, plus extreme fires, are a stark reminder of how fragile and corruptible our living space is.

If the Kalama plant is built, we can foresee a full generation of increased pollution that will hover over our heads -- literally and figuratively. Forty years from now, today's toddlers will be middle-aged, with children of their own: still breathing toxic air.

The Kalama refinery would endanger future generations and exacerbate our climate crisis. Sadly, the strong fossil fuel industry is relentless in its quest for MORE. And with climate change deniers leading our federal response, we are relying even more on State regulators to protect our climate. I urge the Dept. of Ecology to deny this project. Thank you.

Jean M. Avery

One way to think about environmentalism is "caring for creation" -- being good stewards of our natural resources.

- We know that Native Americans have special ways of honoring Mother Earth.
- Pope Francis has urged Catholics around the world to care for creation through his Laudato Si proclamation.
- In my community, volunteers honor the earth by harvesting vegetables for a local Food Bank. Other volunteers pick up litter from parks and beaches.

That is a long introduction, because I don't want to say the next part. So, I'll let National Geographic magazine say it for me: "Our failure to address climate change is trashing the planet." That is a quote from the 2020 Earth Day issue, as is this: "Even if we were to start cutting emissions today, the problem of climate change would continue to grow."

It's hard to see how extracting resources from one side of the globe and shipping them 5,000 miles is responsible stewardship -- especially when air quality is degraded by tons of greenhouse emissions over 40 years.

As climate change is catching up with us, we need to reduce our consumption and focus on local and sustainable sourcing. We need to take a longer view.

A huge methanol refinery is neither local, sustainable, or prudent. To protect our State, region, and climate, I urge Ecology to deny this project. Thank you.

Rachel Haxtema

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

As a mother, aunt and friend to small children, I am deeply concerned that we are not investing in a cleaner future for our children and their children. We are seeing the intense and horrific result of climate change mixed with bad policies for our forests and environment and we need to make change now. Fracked gas is not the answer for my family, for our community and for our world. While we are annoyed and experiencing headaches and sore throats from fires this summer, children in other parts of the world are dying from the effects of climate change. As a Christian, I am called to care for my neighbors - here in Tacoma and Washington and my neighbors in the Pacific Islands with rising seas who are becoming refugees, my neighbors in states with fracking poisoning the water and my neighbors all over the world experiencing rising temperatures and intense storms and disasters and so much more.

As a Washingtonian, I'm proud that our state is responding in small ways and trying to make better choices. We need you to take the lead to act now on yet another fossil fuel project that is not good for us locally and not good for our whole world.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Lauren Cannon

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

As a parent, educator, and pastor, I cannot possibly stand by as a refinery comes in to the land we love, and the air we breathe. As wildfires burn, we know there is no more time for gas and profits, divorced from the impact they will have on our lives. When Jesus had to speak against the powerful systems of his day, that many assumed to be a given, he risked to make a way that cared for those at the margins. We already know that fracked gas hurts people, and that many coastal communities are already displaced, and are already witnesses to how rising seas from our warming planet, will destroy more lives. Gas will add climate pollution. Instead we are now pushed to proactively build sustainable energy systems. Inherent in this moral imperative is investing in a livable future that especially helps those at the edges to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Mr. Derek Benedict

Suzanne Crawford O'Brien

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. As smoke chokes our cities, and wildfires threaten our homes, communities, and the wild lands that we all love, we have to acknowledge the role of climate change, and the threat it poses to our very way of life.

We must stop investing in fuels that threaten our children's future. We must invest in renewable and sustainable energy.

The time is now.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Professor Suzanne Crawford O'Brien

Andrea O'Ferrall

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

We are already seeing the effects of climate change now. Wildfires in the west. Each year reaching higher average temperatures than the year before. Unlivable temperatures in more parts of the world on more days. Drought leading to mass migrations of people. We are in a crisis. We need to halve our CO2 emissions by 2030 to simply MITIGATE the damage.

We need to be looking to the Green New Deal to make our way of life more equitable for all and clean of fossil fuels. A project like this folly. A few people will be making money off of this while causing harm to the entire planet!

This project is unsafe and unwise. I would love it if NO would mean NO and we wouldn't need to say this repeatedly to these fossil fuel projects. It is taking our time and energy away from focusing on Solutions to the mess we are in.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

Anna Johnson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Creation has been given to us to take care of, and respecting it and treating it well is a moral imperative. It is part of my faith as showing love to God, and being in right relationship. Misusing creation is a sin. And opening this plant would be misusing it. We also know that further emissions of climate pollution will only harm our earth farther, resulting in more wildfires like we currently have, worse hurricanes for the Gulf, worse winter weather for the midwest (and us!) and so much more. Even beyond the US, the emissions are creating an atmosphere which has caused intensive droughts and famines in East Africa, and so many other places. Opening this plant will only commit us further to this way of life, which is wreaking horrendous harm upon the earth and the people who live on it. Why would you want to open it?

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Kathy Dawson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. This is not possible for the proposed methanol refinery in Kalama.

The recent, still current, west coast wildfires and gulf coast hurricanes are eloquent reminders that we must stop putting carbon dioxide and other climate pollutants into the atmosphere. We must start reducing human impacts now, not after the next climate warming project designed for corporate short term profits, or the one after that.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. John Flynn

We are currently experiencing a wildfire disaster not seen in recent memory. The cataclysmic wildfires in Washington, Oregon and California, with the associated loss of life and property, should be a wake up call that we cannot continue to ignore.

If we continue down the same path of fossil fuel consumption and exploitation then we accept the apocalyptic results as normal. Do we seriously want to accept as our future this vision of apocalypse? These cataclysmic events are what our future holds in a drastically changing climate unless we dramatically change our behavior.

Green and renewable energy is our only future, not the climate changing consumption of fossil fuels. This one project alone would add 4.6 million metric tons of greenhouse gas emissions per year into our already overburdened atmosphere.

Department of Ecology needs to ask themselves what benefit would this project have for the citizens of Washington who they are supposed to protect. What benefit would there be with the production of more plastic to pollute our oceans and landfills? Of what benefit would the burning of methanol for transportation and industry in China have? The answer is NO benefit whatsoever for the citizens of Washington.

The Department of Ecology should accept their responsibility to protect the health and welfare of the citizens of Washington State and as well as our environment and categorically deny this project. Thank you.

Rejean Idzerda

As I review the Second Supplemental EIS for the Kalama methanol refinery, the wildfire smoke outside my window lies denser than fog. All my doors and windows have been kept shut for days, and the air quality makes it dangerous to venture outside. Unfortunately, intensifying wildfires is only one of the many ways that climate change threatens our health and well-being. I am struck by the jarring incongruity of the urgency of the climate crisis and the nonchalance with which we consider welcoming a massive new fracked gas project in Washington. The proposed Kalama project will use more fracked gas than all other industries in Washington combined and will be one of the largest emitters, producing several million tons of greenhouse gas emissions each year. The project is incompatible with achieving Washington's emission reduction goals. It would be negligent to approve it and ask that you stop it

Scott Starbuck

Director Watson and Dept. of Ecology:

I have fished the Columbia River and her tributaries for 50 years, and I'm concerned about impacts on salmon. I worked the Pacific Ocean as a commercial salmon troller and charter captain, and now I mainly fish the rivers.

In addition to climate impacts, I understand the proposed gas-to-methanol site is unstable as noted in the draft EIS explaining soil at the plant site has a "moderate to high liquefaction susceptibility" in the event of an earthquake.

I saw a July 13, 2015, New Yorker article by Kathryn Schulz noting "In fact, the science is robust, and one of the chief scientists behind it is Chris Goldfinger. Thanks to work done by him and his colleagues, we now know that the odds of the big Cascadia earthquake happening in the next fifty years are roughly one in three." The article continues "In the Pacific Northwest, the area of impact will cover some hundred and forty thousand square miles, including Seattle, Tacoma, Portland, Eugene, Salem (the capital city of Oregon), Olympia (the capital of Washington), and some seven million people. When the next full-margin rupture happens [odds are 'are roughly one in ten'], that region will suffer the worst natural disaster in the history of North America, outside of the 2010 Haiti earthquake, which killed upward of a hundred thousand people."

Therefore, I imagine building the world's largest fracked gas-to-methanol refinery in Kalama is about as smart as building the Fukushima Daiichi Nuclear Power Plant in Ōkuma, Fukushima Prefecture, near the Pacific Ocean about 33 feet above sea level partly to reduce operating costs of seawater pumps. You know the result of that. Charles Perrow wrote in the April 1, 2011 issue of the Bulletin of the Atomic Scientists "Currently our approach to risk is 'probabilistic,' and the probability of a tsunami seriously damaging the Fukushima Daiichi plant was extremely small. But we should also consider a worst-case approach to risk: the 'possibilistic' approach, as Rutgers University sociologist Lee Clarke calls it in his 2005 book Worst Cases: Terror and Catastrophe in the Popular Imagination. In this approach, things that never happened before are possible. Indeed, they happen all the time."

In short, in addition to the obvious climate impacts, a one in three chance of a big earthquake hitting Kalama in the "next fifty years" should be enough risk to say "No."

Sincerely,

Scott T. Starbuck

MCBLAINE BOYLE

Please don't go ahead with this. It is just the kind of project which is more damaging in the long run.

Larry Hamilton

In efforts to keep things simple and brief based on the information I've currently received, I think NW Innovation Works (NWIW) should seek a place outside of our country to build their methanol plant.

It seems like a foregone conclusion that the use of methanol is growing worldwide and the fundamental debate is whether we want to accept a temporary financial uptick for our local governments as a tradeoff for increased greenhouse gasses in the state of Washington.

In my opinion, by the time the NWIW executives realize the impact of their damage to the environment barring any potential catastrophic accidents, they'll have passed on into the afterlife and the children of Kalama and the state of Washington as a whole will have to carry the unhealthy burden.

At this point, given the current events that are occurring right now as I write this (west coast fires), it's also foregone conclusion that the effects of global warming is destroying our environment and killing us. Given that recent example, why would Ecology sign up for yet another pollutant that's going to accelerate the process? I know all of you at the Department of Ecology are sitting in your home right now because you can't go outside on your regular summer day walk, knowing the smoke outside will make you sick.

No matter what occurs here in Kalama with this NWIW methanol plant, the world will easily be supplied with enough methanol for whatever purpose. So let us not skew folks into thinking we're doing the world a favor. This is purely about some key NWIW folks looking for a way to get rich(er) at the expense of our safety, health and wellbeing.

Don't allow NWIW to build a methanol plant in Kalama or the state of Washington. We already know how this story will end and no matter how you spin this, it won't end well for us or the defenseless wildlife!

John Flynn

The mission statement of the Washington Department of Ecology is to "protect, preserve and enhance Washington's environment for current and future generations." It is the responsibility of the Department of Ecology to protect the residents of the state from harmful health and environmental impacts.

The proposal by Northwest Innovation Works to build a fracked gas to methanol refinery on the shore of the Columbia River for shipment to China is in direct juxtaposition to that responsibility. Even the Governor of Washington, Jay Inslee, who was originally a supporter of the project, has come to the realization that this proposed fossil fuel project is not supportable.

I encourage the Department of Ecology to follow the governors lead and deny any and all permits for this unsustainable project.

Thank you.

Nancy Johnson

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. As a retired RN, I find it unconscionable to expand the use of dirty, unhealthy fossil fuels when we should be doing all we can to stop their use. We can and must do better.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms. Nancy Johnson

carolyn atkinson

Suicide is on the rise in young people all over the country. Why? We see our government agencies taking a sledgehammer to the possibility of a habitable future for us because of projects like the disastrous proposed Kalama methanol facility. The alternative to a habitable future is genocide on all of us, with fossil fuel exploitation as the means. Historically and presently, beef and fossil fuel development like this Kalama facility have been engines of genocide against indigenous peoples in the Americas. In 2020, the genocide is turning to suicide as well as the devastating effects of these decisions ripple out of control of any one racist, shortsighted organization. Kalama is already burning.

What exactly will Northwest Innovations spend their blood money on in the ashes of the state and country? They are stoking the terrifying flames of disaster with this project. This is a stupid, suicidal, ecocidal, genocidal choice. The science has been clear for 50 years. Keep it in the ground. No new oil, gas, or coal facilities. No new CO2 megapollutor projects. Keep it in the ground.

sue corcoran

We do not need this in this state or in our world anymore. Plastic should go away. Fracking should not be allowed. We have so many environmental problems. Why add to them? For a few jobs? It's not worth it. The impacts to our health is beyond measure. The impact to our planet is sickening. The greenhouse gas emissions are unacceptable. The use of fresh water and the limited resources like natural gas, unacceptable. I guarantee that if you allow this, there will be so many protests and lawsuits it won't be worth it for this company to exist. This won't be easy and lawmakers will be held accountable.

Melissa Moonves

Please don't do this. As a mother & grandmother, I worry about the future. Climate change is real & adding more pollution in our state to help China doesn't make sense for the long term. Stop fossil fuel use, promote renewable resources & help make a future that habitable on Earth. Thank you.

Janine Roth

I'm continually AMAZED that a state that brags so often about how green it is seems to think these projects, that benefit foreign companies , at the cost of the health of the citizens of WA are OK. I am against it . WA does not need one more pollution spewing facility on it's soil. Please do not let this be built, just so China can benefit.

Carol Goodall

My husband and I are opposed to the Kalama methanol facility. It might provide some jobs in construction, but those will not be long-lasting. It will just add to pollution and global warming and aggravate our already deteriorating environmental conditions. We should not be shipping methanol to China. We should be trying to cut our use of such products.

C Parks

Northwest Innovation Works says its methanol will be used to produce plastic. Has ecology given any consideration to the damage this plastic pollution will create? Research estimates that across its lifecycle, plastics account for 3.8 percent of global greenhouse gas emissions. To put that in perspective, if plastic use were a country, it'd be the fifth largest emitter of greenhouse gases in the world. On its present trajectory, emissions attributed to plastic would exceed the entire remaining carbon budget for all industrial greenhouse gas emissions under a 2°C scenario.

In the United States alone, extracting and transporting natural gas for plastic production generates an estimated 12.5 to 13.5 million metric tons of carbon dioxide equivalent per year – that's the same as driving nearly 3 million cars for a year. On its present trajectory, emissions attributed to plastic would exceed the entire remaining carbon budget for all industrial greenhouse gas emissions under a 2°C scenario. Plastic refining is among the most greenhouse gas-intensive industries in the manufacturing sector — and the fastest growing.

Finally, global emissions from incineration of plastic waste totaled 16 million metric tons of CO₂ equivalent in 2015 representing about 40 percent of plastic demand.

The ongoing pollution upstream and downstream from this plant is outrageous. I ask Ecology to deny the Kalama Methanol Plant Permit.

The Role of Plastics in the Climate Crisis

August 19, 2020 | 1:30 PM

Retrieved 9-13-120 from The Climate Reality Project, https://climaterealityproject.org/blog/role-plastics-climate-crisis?utm_source=advocacy&utm_medium=email&utm_campaign=general&utm_content=realitynow-email-9-0920&mkt_tok=eyJpIjoiWVdabFptRTBNakkyTURGayIsInQiOiI2dXVJSkVTK3o1aHIUbIFRcFFGVW1OOE9ENEZQd25ESGdSTVhTdZVrNldXBXd4VSthTkRkM0pVNWZhYld3SnNWZ0IweWNmSEEWnFl1TjFhSUprRk11SjRtc1o0TG9HbXRKVHJQdE9oVzRnUVZncnN2bTRGQXIWT3NDYIVEUlo0TG5XeWhKeFRUOE10MWJSTWFEBTgwMWc9PSJ9

From its extraction and production to its management as a waste product, plastic generates planet-warming emissions at every step of its lifecycle.

KEY TAKEAWAYS:

- If plastic use were a country, it'd be [the fifth largest emitter](#) of greenhouse gases in the world.
- Extraction and transport, refining and manufacture, and waste management are the three broad lifecycle stages of plastic — each producing varying amounts of greenhouse gases.
- On its present trajectory, emissions attributed to plastic would exceed the entire remaining carbon budget for all industrial greenhouse gas emissions under a 2°C scenario.

Odds are, you know that the world has a serious plastic waste problem.

To start, there are about [150 million metric tons](#) of plastic in our oceans, with about 10 million tons added each year. Some countries are dealing with an overflow of trash and [can no longer shoulder the burden](#). Then, there's the issue of pervasive [microplastics](#): tiny plastic debris that now contaminates everything from the world's most remote ecosystems to our own bodies.

Understandably, these very visual impacts are front and center in the plastic pollution conversation. **However, though less immediately apparent, we can't afford to overlook the severe impact plastics also have on our climate.**

Research estimates that across its lifecycle, plastics account for 3.8 percent of global greenhouse gas emissions. **To put that in perspective, if plastic use were a country, it'd be the fifth largest emitter of greenhouse gases in the world.**

It manages to have a staggering impact through each emissions-intensive step of its lifecycle — a process that is well-worth breaking down.

EXTRACTION AND TRANSPORT

Over 99 percent of all plastic is made from fossil fuels, most commonly oil and natural gas. Drilling for these fuels, extracting them from the ground, and transporting them to processing facilities are all very emissions-intensive processes.

In fact, in the United States alone, extracting and transporting natural gas for plastic production generates an estimated [12.5 to 13.5 million metric tons](#) of carbon dioxide equivalent per year — that's the same as driving nearly 3 million cars for a year.

But that's not all.

Another major source of emissions at this stage is methane leakage and flaring, which takes place during the extraction of natural gas. This matters because, on a 20-year timescale, [methane](#) is roughly 90 times more effective at trapping heat in the atmosphere than carbon dioxide.

Additionally, the clearing of forests and fields for drill sites and pipelines is a double-whammy for our climate. Not only are large areas of plants and trees destroyed, which itself releases carbon, but they're no longer around to absorb carbon dioxide in the future.

REFINING AND MANUFACTURE

According to a recent Center for International Environmental Law (CIEL) report, [Plastic and Climate](#), "Plastic refining is among the most greenhouse gas-intensive industries in the manufacturing sector — and the fastest growing."

This is true for two main reasons:

First, cracker plants. These are facilities that use very intense heat to break down ethane and propane into ethylene and propylene, respectively: the building blocks of plastic. Globally in 2015, emissions from cracking to produce ethylene produced [184.3 to 213.0 million metric tons of CO₂](#), as much as 45 million passenger vehicles driven for one year.

And second, manufacturing is so emissions-intensive because of the amount of energy required to power the plants that turn raw plastic materials into the products we use.

WASTE MANAGEMENT

Once it has been used, the vast majority of plastic is either recycled, landfilled, or incinerated — each method producing different amounts of emissions.

[Only about 9 percent of all plastic](#) is ever recycled. Relative to the landfilling and incineration, this process generates medium emissions. However, it does prevent new plastic from being produced, which ultimately does lower its net impact.

[Landfilling and litter accounts for 79 percent of all plastic waste.](#) While it emits the least greenhouse gases, it does, of course, cause the overflow of plastic waste seen around the world.

Finally, incineration is the most emissions intensive of the three methods. Global emissions from incineration totaled [16 million metric tons of CO₂](#) equivalent in 2015 for plastic packaging, representing about 40 percent of plastic demand. And that's before accounting for the open burning of plastic or incineration that occurs without any energy recovery.

A GROWING PROBLEM

We have our work cut out for us fighting plastic pollution.

The combination of fracking causing gas prices to drop and increasingly clear signs that declining fossil fuel use is on the horizon — given the rise of electric cars, for example — is pushing fossil fuel companies to look elsewhere to keep up their profit margins.

Unfortunately, the next major market they're turning to is plastic.

This is deeply troubling because, on its present trajectory, emissions from plastic production and use **would exceed the entire remaining carbon budget for all industrial greenhouse gas emissions under a 2°C scenario.**

2°C of warming is the internationally accepted goal estimated to keep the worst of the climate crisis at bay. And now, our growing use of plastic seriously threatens its feasibility.

JOIN OUR FIGHT

It's clear that a world of endless fossil fuel use does not go hand-in-hand with preserving a stable climate. It is a threat to healthy natural habitats, wildlife, and communities everywhere.

That's why we're taking action, and we hope you'll join us.

Across the country, everyday Americans are joining Climate Reality chapters and working together for practical climate solutions. These friends, neighbors, and colleagues are bringing clean energy to their towns, fighting fracking developments, and so much more. **They're making a real difference for our climate, and you can too.**

If you're ready to take action in and for your community, then we invite you to join a Climate Reality chapter. [Click here to learn more and join today!](#)

Linda Bridges

I support this project. It has been proven safe and will provide much needed jobs to this area. I have lived here all my life. The economy in our area has been going steadily downhill. We desperately need family wage jobs.

Gary Akizuki

The Kalama Methanol Plant being proposed by Northwest Innovations Works (NWIW) will be the largest fracked gas refinery in the world. It will spew 4.6 million tons of greenhouse gases each year for 40 years, use millions of gallons of water from a Columbia River aquifer each day, pollute the air with cancer-causing emissions, and pose safety hazards during an earthquake. The refinery would use more fracked gas than all the gas-fired power plants in Washington, combined. This is a staggering amount of pollution that will undermine Washington's greenhouse gas reduction goals at a time when it is critical for us to drastically reduce the use of all fossil fuels.

NWIW is promoting their plant by saying that it will produce less pollution than that of coal, but that is a misleading argument. All high-carbon paths are unacceptable and inconsistent with Washington's clean energy and climate goals. Adding more pollution of any kind will only increase the effects of climate change that we are already experiencing—out of control wildfires, Covid-19, monstrous hurricanes, droughts, heat emergencies and floods. Millions of people's lives are being harmed by this fossil fuel pollution and millions of jobs are being lost. If it wasn't clear before, it is abundantly clear now that we have to take immediate steps to reduce all fossil fuel use if we are going to survive.

I ask that Ecology deny NWIW's permit for this plant.

Martha Bishop

I see the effects of climate change all around. I grew up on Fidalgo Island where crossing a sandbar meant getting squirted multiple times by clams. We would fish for little fish, and find tiny pink shells smaller than my finger nail. The number of clams is diminished and I haven't seen the tiny pink shells in ages. Ocean acidification is most likely contributing to this. That, plus other pollution from extraction industries and fossil fuel use, spells disaster for our land and water. Who are the few who will benefit the most from building this huge methanol plant? Not our world.

Dena Turner

My name is Dena Turner. I live in Portland, Oregon. I am writing to address my concern about how the Kalama Methanol Refinery exacerbates climate change and climate catastrophe.

The entire West coast has been wracked by statistically large and destructive fires. My City, my neighborhood, large parts of the State of Oregon are seeing hazardously unhealthy air from wildfires. I am a prisoner in my house because of wildfire caused smoke. California is seeing among the largest fires ever. Washington State likewise is being hit by destructive wildfires. Many of the fires were caused by unusual and dry winds, winds that are more likely now and in the future because of climate change. Fires in California were caused by a long multi-year drought and thousands of dry lightning strikes. This is abnormal, and again more likely now and in the future because of climate change.

I write this letter because I am extremely concerned that climate change is a risk to future life on planet earth. Science tells us that already one million species are at risk of extinction. We know that the likelihood of droughts, fires, floods, hurricanes, tornadoes, crop failures, famines are all increased with climate change. As I write this Hurricane Sally is impacting Gulf States. There are so many hurricanes this season that the naming system is challenged, soon requiring the use of the Greek alphabet to name hurricanes. This is not normal.

I am concerned that fracked gas is not clean and not natural. Methane is 86 times more potent as a warming gas than carbon dioxide. The methanol refinery would increase Washington State's contribution to global warming by nearly 10%.

I ask you, I beg of you to take a stand against the Kalama methanol refinery. I ask you, I beg of you to consider the future of planet earth. I ask you, I beg of you to consider the one million species of risk of extinction caused by pollutants in their environments and loss of habitat. I ask you, I beg of you to consider respiratory illnesses, particularly in neighborhoods where poor and people of color reside. I ask you to take into consideration that NWIW provides very vague language related to mitigation. This is unacceptable. The future of planet earth cannot be put at risk with increasing fossil fuel use promoted through vague language that risks our future.

Because of my concern, I call on the Washington Department of Ecology to reject the Kalama methanol refinery and to deny the Shorelines Permit for this project. Take a stand for the future of planet earth, my grandchildren, and your grandchildren, that they may have a livable planet.

Thank you for your consideration.

Dena Turner

Teresa Flynn

My husband and I live in Kalama and are against the proposed Methanol Refinery This would be a out of control use of our resources. The pollution left behind would be enormous. The select few that would get rich ,from this never before built design is a pipe dream.Our own governor Jay Inslee has come out against this project. Pleas this has gone on way to long put an end to this proposed Kalama Methanol . Refinery. Teresa Flynn Kalama, Wa.

M Huljev

Please do not let this facility to be built. Providing some jobs is not enough justification for short and lasting negative impact on the environment. Perhaps this is a lesser evil to coal, but it is still an evil option.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

The proposed methanol refinery will be the third attempt to put a speculative fossil fuel facility at that site. The two previous facilities that failed there should be a warning to consumers and regulators not to rely on the sales pitch presented for these types of projects.

The first attempt was a coal-gasification facility in 2006 called the Pacific Mountain Energy Center.

Environmental sales pitch-

"Clean alternative to conventional coal plants. 20 to 25% less CO2."

"Clean, base-load generation to the Pacific Northwest."

"Environmentally friendly alternative to conventional coal-burning power plants and says the region will need the plant's energy."- Energy Plant Soar Costs from Estimate-

"By stripping out soot and other regulated pollutants, Energy Northwest bills the plant as a clean alternative to conventional coal plants -Proposed Kalama Coal Plant to Receive First Public Hearing-

Unlike conventional coal plants that burn coal, Energy Northwest says the facility would produce "a clean-burning, hydrogen-rich synthesis gas from petroleum coke, coal or other solid feedstocks." The technology allows for the reduction or removal of carbon dioxide and pollutants often associated with power plant emissions."- Coal-"a 19th-century answer to a 21st-century problem-

According to Energy Northwest, regulated emissions from the complex are expected to rival, and potentially outperform, those of a natural gas plant. The clean-burning synthesis gas will be produced by gasifying, rather than burning, coal, pet coke (a byproduct of crude oil refining), and potentially other carbon-based feedstocks in a fully enclosed process. Shipping out - Vancouver Business Journal-

Energy Northwest officials say the new power plant, called the Pacific Mountain Energy Center, "will be a valuable tool in advancing nationwide efforts to develop permanent in-ground carbon storage."-Enviros Challenge Proposed Coal Gasification-

The utility is part of the Big Sky Carbon Sequestration Partnership, an effort funded by the U.S. Department of Energy to develop and promote permanent, large-scale carbon dioxide sequestration.- Enviros Challenge Proposed Coal Gasification Power Plant-

Energy Northwest Project Manager Ted Beatty said the new facility would have a beneficial impact on wind power development. "Adding additional full-time power from a facility like Pacific Mountain Energy Center will allow the integration of more wind, solar, and other intermittent power.-Enviros Challenge Proposed Coal Gasification Power Plant-

Spend \$10 million to offset the emissions at other plants in the state

Spend \$50 million to research possible ways to sequester the carbon dioxide into the ground, such as injecting the gas into a saline aquifer in Cowlitz County. If they couldn't do so, then they might have to consider buying and shutting down a conventional Western coal plant.

A lot of these points are the new norm when it comes to fossil fuel infrastructure, better here than somewhere else.

In November 2007, EFSEC voted unanimously to reject the plant because they had concerns that if they actually would follow through on the promise of carbon sequestration. Kalama project, stating the applicant's statements about carbon sequestration, amounted to "a plan to make a plan."

The state attorney general's office called the plan "deficient" and "vague,"

The second endeavor in 2007 was to put a gas-fired gasification facility called the Kalama Energy Center.

Promises:

The power can be a good backup to wind energy.

The project was listed as a bright spot in Cowlitz County Commissioner George Raiter's 2012 "State of the County" address -TDN- Kalama natural gas power plant plans in jeopardy-

Why it failed:

Veresen announced it was pulling out of the project due to "market conditions,"-TDN- Kalama natural gas power plant plans in jeopardy-

Paoli said. He noted that natural gas prices are volatile, possibly undercutting the viability of the project.- TDN- Kalama natural gas plant power plans in jeopardy-

The two previous projects by energy companies should be a wake-up call to either look at our energy future needs or to make sure we don't get trapped into another speculative fossil fuel endeavor. We need to make sure we have the power to our local public utilities and to supply growth needs in the region and provide reliable backup service to renewable energy generation in the Pacific Northwest.

Don Steinke

House Bill 2311 passed in 2020. It establishes the goal of reducing state wide emissions to 50MMT CO₂e by 2030. The latest figure is 97.4 MMT CO₂e

To reach that goal, we must reduce emissions about 6.4% per year starting in 2021. That may not compute unless you understand that we would mean 6.4% each year of the remaining balance.
Rate = 93.6% of remaining, or annual reductions of 6.4%

Start year	Beginning Balance	Ending Balance
------------	-------------------	----------------

2021	97.4	91.2
------	------	------

2022	91.2	85.3
------	------	------

2023	85.3	79.9
------	------	------

2024	79.9	74.8
------	------	------

2025	74.8	70.0
------	------	------

2026	70.0	65.5
------	------	------

2027	65.5	61.3
------	------	------

2028	61.3	57.4
------	------	------

2029	57.4	53.7
------	------	------

2030	53.7	50.3
------	------	------

The speculation in the latest SEIS for Kalama Methanol imagines possible reductions overseas, but that doesn't count with HB 2311.

Furthermore, HB2311 does not allow for local carbon offsets, such as are proposed by NWIW. The limit is 50MMT CO₂e, period.

SB 5116 requires gas plants to be net zero by 2030, and Trans Alta will shut down in 2025, but which other businesses will be need to compensate for the increases from Kalama Methanol?

G. P.

This is horrible and goes against what we have been proclaiming on both sides of the fence

Seems extremely un-environmental and unAmerican Putting our land , generations of Americans health and well being at risk

Paula Hamilton

Dear Department of Ecology,

I'm writing to oppose the Kalama methanol facility at the Port of Kalama, Washington. Northwest Innovation Works (NWIW), the company behind the project, indicates its reason to build the methanol plant will generate 1000 family-wage jobs. These employees will be needed during construction, however once construction is complete and the facility is operable, NWIW will only require 190-200 permanent jobs, therefore indicating a designed-in layoff.

NWIW also said the plant would contribute between \$30 million to \$40 million in tax revenue annually. While the analysis show the facility will consume up to 320 million cubic feet of methane per day. The results of that totals up to 4.6 million tons of pollution every year for 40 years.

NWIW has stated the methanol would be used for plastics production in China, but more than likely, methanol will also be used as fuel, regardless of the what they claim. They will say whatever it takes to convince authorities to approve and allow the project to go forward. Just because NWIW "promised" methanol will only be used for plastic products and not fuel would be difficult to police once it's out of their control and the property of China. Once NWIW is operational, their customers will use the methanol for whatever they choose, including fuel.

We don't need another plant polluting our air, harming our wildlife, fish, water, vegetation, and food supply. We're currently combating global warming incident right now with the western states tragically on fire along with our air quality index indicators in the hazardous zones. How much more do we have to suffer for a few more folks to get rich? Can you imagine telling your grandchild 20 years from now, it was safe to play outside and breathe the air?

Please do not approve and allow to build a methanol plant in Kalama, Washington.

Thank you,
Paula Hamilton

Chris Chaplin

Washington should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama.

NWIW misled your agency, and the public, about the purpose and impacts of the refinery. I am counting on Ecology to dismiss NWIW's misleading claims and accurately account for the project's upstream and downstream climate pollution. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

For the community of Kalama and for our climate, the risk is simply too big. Please keep our communities safe, and keep Washington on track to meet our goals for reducing climate pollution. I am counting on you to do the right thing and stop this dirty, dangerous fossil fuel export project.

Thank you,
Chris Chaplin

I care deeply about this issue.

liza Michaelson

The Kalama Manufacturing and Marine Export Facility Second Supplemental EIS Is a chilling example of valuing a temporary economic boon over generations of environmental harm. It would be a terrible mistake; and it should NEVER HAPPEN. I don't have any suggestions other than, PLEASE take it off the table. Yes, maybe they will try to take it somewhere else, but we have a duty to the children and the world to say, "NO NO NO, Not in Washington!" Department of Ecology, PLEASE do the job we trust you to do. Stop this idea now. Thank you.

Kris Freeman

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

This type of energy is unsustainably dirty, and economically unsustainable. The Kalama methanol refinery would also be another industrial stress along the Columba River. Please deny its Shorelines Permit.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Kris Freeman
833 NW 53rd St Seattle, WA 98107-3644

Lorraine Heller

The present fires should be a wake-up call that we need to stop causing emissions that effect our greenhouse gas emissions. Climate change is here and if we fail to address it we will be at its mercy. I ask you to reject this methanol refinery plant and decline the Shoreline Permit necessary to build it. It is planned to be located close to a major river, the Columbia, and threatens pollution of it's water. It is slated to be sent to Asia where it will be used to manufacture plastics. This refinery is being built for all the wrong reasons. We must change to manufacturing non-polluting products and switch from fossil fuels if we are to survive on this planet. Sincerely, Lorraine Heller

Callie Mabry

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. John Flynn

The cataclysmic wildfires we are currently experiencing in Washington, Oregon and California, with the associated loss of life and property, have a direct correlation to climate change. Even those of us without advanced scientific degrees can see the impacts of climate change and global warming and how those impacts affect our daily lives.

Other significant effects of climate change and global warming that are not as glaringly obvious are:

- ~ global temperature increases
- ~ rise in sea levels affecting coastal areas and cities
- ~ increased ocean acidification with its associated negative impacts on the marine ecosystem
- ~ reduction in annual snowpack
- ~ reduced runoff from less snowpack with reduced stream and river flows, with associated increases in water temperature, less water for irrigation, summertime hydropower production and negative impacts on fish migration and reproduction
- ~ more intense and frequent heatwaves, tropical cycles (hurricanes) and heavy precipitation (increased flooding events)
- ~ negative impacts to biodiversity, drinking water and food supplies.

The proposed fracked gas to methanol refinery would add an additional 4.6 million metric tons of greenhouse gas emissions per year into this equation. We, as a species, are currently at a tipping point where we desperately need to reduce greenhouse gas emissions for our survival, not add more. I urge the Department of Ecology to deny any and all permits for this proposed project.

Thank you.

This is the wrong direction to be taking.

I am a citizen of Washington State and planet earth. We are at the brink of a climate crisis that is going to be with us for many years to come. As a mother I care deeply about the environment we are leaving our children, their children and the generations following. We continue at this time to proceed with our lust for money and power with no regard to our future.

The science is behind all I say here. Our earth is showing us the myriad problems faced by continued, purposeful ignorance. Hotter climate, rising seas, worsening fires, hurricanes and storms. Higher sea levels pushing more people into refugee status.

Here we are discussing more of the same...fossil fuels are the culprit. With a greater national will and placing our money and brain-power into solving the crisis and improving clean energy alternatives we can change this worsening scenario around.

Stop this methanol plant now. Let's walk into a better future together.

Thank you,

Debbie Stempf

Kurt Cobain

Save the environment!

JOANA KIRCHHOFF

There are many reasons to stop the Kalama Export Facility. As Washington and Oregon burn, often on the proposed pathways for LNG pipelines the dangers of new pipelines and explosive facility is more obvious than ever before. The climate fires and hurricanes will not stop until we stop new facilities and begin to decrease our dependence on fossil fuels.

Jeff Ament

Save the whales!

carolyn atkinson

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

Why are we even considering trusting the health and safety of our state to an organization that has demonstrated such a history of dangerous lies for profit? Cancel the project. With a project of this scale, they would be a massive drain on state regulatory resources just to keep them within the dangerously-permissive pollution regulations that they've admitted to. It's foolhardy. Their greed will kill people like so many other projects before if they are allowed to build this facility.

carolyn atkinson

Kalama is already burning. It will burn again. It is burning because of the destruction to our atmosphere caused by fossil fuel and manufacturing projects like this one. Fossil fuels are flammable. Why on Earth are we even considering building a facility for explosive, toxic products in a wildfire risk area?

Hamboyan Harrison

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Alice Shapiro

We are already in the midst of catastrophic climate change with fires, hurricanes, floods, etc. I have not been able to breathe without pain for several days now due to heavy smoke from enormous Oregon wildfires nearby exacerbated by the use of fossil fuels that are accelerating global warming. Enough is enough!

Craig Heverly

I am 82. I probably wouldn't live to see this project completed nor the destruction it would cause if allowed to go ahead. But I have three young grandchildren who will certainly be victims for most of their lives should you approve this project. They are presently homebound, victimized by hazardous air directly related to burning forests and, indirectly, related to climate change. All the science is saying we must stop pumping carbon into our atmosphere immediately if we are going to meet temperature targets and my grandchildren and all children around the planet are to have anything close to the life, liberty, and pursuit of happiness we have known for centuries. And think of the tax burden it will place down the road when the Chinese market for fracked gas dries up, the company decides to call it quits, declares bankruptcy, and walks away, leaving today's children who might be tax paying adults then to clean up their mess. It makes absolutely no sense -- ecologically, scientifically or ethically -- to approve this carbon belching project. Please do the right thing. Turn it down, once and forever. Thank you for your service and attention.

Diane Dick

2020 09 16 Comment #3

Washington State Department of Ecology
Olympia, Washington

Re: Formal Comments on Kalama Manufacturing and Marine Export Facility Draft Second Supplemental Environmental Impact Statement, September 2020

Please deny Kalama Manufacturing and Marine Export Facility (KMMEF) a shoreline substantial development and a conditional use permit. The environmental impacts from the project are significant and cannot be mitigated.

Greenhouse gas emissions are insufficiently explained in the draft second supplemental environmental impact statement (SSEIS) and the data contains errors and omissions.

In reviewing 3.7 Significant impacts and mitigation, p. 105, there is the statement, "GHG emissions occurring within Washington State from the sources listed above are estimated to be between 786,117 and 1,421,748 MT CO₂e per year." This range of in state GHG emissions is patently incorrect.

For on site process emissions alone, current air discharge permit, ADP 16-3204, issued by Southwest Clean Air Agency June 2017, states on p. 3,
"2.1 Emission Limits

No. 1 Combined greenhouse gas emissions from approved emission units shall not exceed 1,076,000 tons of CO₂e per calendar year. Annual emissions shall be calculated using procedures consistent with the provisions of 40 CFR 98."

In metric units this is equal to 976,131 metric tons of CO₂e.

This would be a very minimum NWIW Kalama methanol refinery would emit annually. The technical support document, p. 18, states the facility-wide potential to emit is 1,119,890 tons per year (1,015,947 metric tons). The permit states NWIW agreed to a voluntary limit of less than potential capacity to emit.

The range for in state emissions should begin at no less than 1 million metric tons annually. This alone is a significant increase in Washington state emissions. Adding other in state emissions, including over 250,000 metric tons annually for power purchases, would make KMMEF Kalama methanol refinery one of the top three GHG emitters in the state, excluding TransAlta. Note, this makes data in SSEIS Figure 3-1 also invalid.

When the stated legislative goal in Washington state is to reduce current GHG emissions, there is no rational environmental reasoning to allow shoreline permits for KMMEF Kalama methanol refinery.

Thank you,

Diane L. Dick
Longview

Matt Hohensee

It is short-sighted to approve projects like the Kalama NWIW methanol refinery when it is clear that pollution and fossil fuel consumption are unsustainable. We should be encouraging projects that address the problems they present, rather than increasing them. We will have to move away from this sort of project eventually, and to approve this is just to delay the inevitable. The state of Washington should do everything in its power to encourage that the money spent on projects like this one is invested in clean energy projects instead.

Kimberly Jarvis

Hello!

I write to you as I sit and watch the smoke clogged skies in Portland, OR. It's too toxic to be outside which just a taste of things to come as our planet heats up. Yes, the fires were caused by a freak wind event, but also due to our forests drying up from climate change. Countless people are suffering respiratory distress, people have lost their homes, people have lost their livelihoods and more tragically people have lost their lives. That's the impact on humans, consider the animals dead and dying because of these wildfires, consider the vast amount of habitat destruction. How much can more loss is acceptable?

The Kalama plant is one more step in the wrong direction, feeding our addiction to fossil fuels. There are no good reasons for this plant to go on-line. NONE! Clean, green, renewable, alternative energy sources exist and we should be pumping all of our resources into utilizing them. Pan Pacific Energy's assertion that this is good for the planet because it will stop China from burning coal is pure speculation and bunk. We have no idea how these markets will act in years to come. Do what is good for the planet today with the information that we are certain of, namely that this plant would pump more greenhouse gases into the environment, hastening climate change. Reject this ill-conceived, foolhardy project.

Sincerely,
Kim Jarvis

Rosemary Siipola

Washington State Department of Ecology
Attn: Rich Doenges
NWIW SSEIS
PO Box 47775
Olympia, Washington 98504-7775

Dear Mr. Doenges,

This is a letter for all of the folks in our state who believe in science and fear for the health of our environment. The report from the Department of Ecology on the Northwest Innovation Works, released earlier this month, methanol facility in Kalama offers hope and solutions at a time when we all desperately need it.

Northwest Innovation Works Kalama has consistently claimed that its facility, upon completion, will reduce harmful global greenhouse gas emissions. The first two environmental impact studies, completed for the project, validated that thesis. However, environmental groups took issue with the findings and sued for a more comprehensive study. That study, now released by the Washington Department of Ecology, confirms that Northwest Innovation Works Kalama does, indeed, reduce harmful global greenhouse gas emissions. Three studies now confirm this fact. At this point, the science is clear and solid on this issue.

For every year the plant isn't operating, we lose a chance to reduce millions of tonnes of greenhouse gases from our atmosphere. This project cannot wait. If, as Washingtonians, we truly care about the environment, and believe in science, then the three independent environmental impact studies, conducted over the past six years lead to two conclusions:

1. The State of Washington's robust environmental permitting regulations support this project, upholding its high standards and opening the way for additional, modern, environmentally sound projects to be permitted and built in Washington, revitalizing and transitioning our economy, while promoting our state's standards for environmentally safe and sound industry, and,
2. Taking all of this into account, it's time to put people to work in Cowlitz County in the new, modern, green economy.

As a proud Cowlitz County citizen, and a member of the Lower Columbia College Foundation Board of Directors, I can honestly say that Cowlitz County is ready, willing and able to meet the opportunities and challenges this new economy will bring to our region.

Sincerely,
Rosemary Siipola
Kalama, Washington

carolyn atkinson

I write as a young person terrified about the prospect of living on this Earth in 2070, given its current catastrophic trajectory driven by projects like these.

It is irresponsible and dishonest to pretend that speculation about the hypothetical worse actions of other parties would somehow override the known and certain harms wrought by this project. It is irresponsible and dishonest to let NWIW pitch unreasonably, optimistically low values for its emissions and leakage plans and treat them as the facts of the matter. The percentage of methane emitted as a proportion of gas delivered remains too low in the SEIS (p. 40, 43). In the new SEIS, the "medium" scenario assumes that less than 1% of the delivered natural gas will escape. Recent information continues to show a high rate of wells leaking across B.C. and Alberta. And new reports continue to show that methane leaks are likely vastly underreported in both British Columbia and Alberta.

Furthermore, even the "high" estimate in the SEIS is only 1.46%, far below the potential upper bound of leakage rates possible for under-studied and under-reported methane leaks in Canada. The SEIS should be revised to include a "medium" scenario of 2% leakage, and a "high" scenario of 3% leakage to capture a reasonable range of potential impacts from the upstream portion of the Kalama project's emissions.

The analysis fails to account for the long-term impact of plastics. While most or all of the methanol may end up being burned directly for fuel, some of it may be converted to olefin to make plastic. The SEIS does not assess the end fate of the plastic, which may itself become a fuel in China via waste to energy incineration. Waste to energy incineration is rapidly growing and has tremendous potential carbon pollution and negative public health impacts. Further, emerging research continues to show that plastics pollution is a ubiquitous, long-lasting problem globally and within Washington state.

The reason that this analysis has had to see so many revisions so far is because NWIW has demonstrated a commitment to dishonesty that puts the health and safety of the region, its other industries, the country, and their workers at serious risk of bodily harm. This commitment to undermining the public good and the good of their workers should disqualify this project alone.

"We'd do it cleaner than someone else might" is a lie that has been repeated by those clinging to fossil fuel relevancy for years. It wasn't true for Appalachian coal, and it isn't true for NWIW methanol. We deserve, and we will receive, a better and cleaner future.

There are other ways to expand the economy. We are in need of investment in truly sustainable infrastructure backed by facts other than speculation about worse actors. Northwest Innovation Works should innovate some of those and use accurate facts in their first proposal if they want to win back the trust of the community.

carolyn atkinson

Kalama is currently under orders for residents to restrict water usage. The proposed facility would use millions of gallons of water from an aquifer that is already seeing such stress that it matters who waters a garden. This makes the residents of Kalama and surrounding areas responsible for personally mitigating the negative externalities that the proposed facility would have on their water resources. That's not fair, safe, or democratic for a corporation like NWIW to impose.

Kalama doesn't have the water, and nobody has the air to absorb the negative effects of this project. Are strict 5 minute showers and dead crops across the region supposed to mitigate millions of gallons of water wasted by this facility?

Cancel the Kalama Methanol project.

Kathy Ruhl

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this projects impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washingtons climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

As I sit here looking at a darkened sky, surrounded by smoke and ash, I ask you to please, keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution. These fires, all over the world, were caused by climate change, brought on by pollution. Right now, they are adding their pollution created by the fires world wide and increasing climate pollution.

Please don't let our thirst for fossil fuels destroy our way of life and, eventually, our planet. Deny NWIWs proposal for this dangerous methanol refinery in Kalama.

Mike Reuter

I am speaking here as an individual and not as the Mayor of Kalama.

Why would the Chinese government ask American taxpayers to underwrite their refinery?

NW Innovation Works is applying for a loan guarantee from the Department of Energy to cover the entire project. A heavily redacted application asks the taxpayers to underwrite the full cost of the \$2 billion refinery. That means the taxpayers could be on the hook for the entire amount should NWIW decide to close up shop after the multiple tax incentives end, or if there is a significant spill or explosion.

NWIW is renting office space at the port. The company doesn't have any assets to attach a lien or impose a hefty fine if there was an incident. The company has less than 20 employees and is a multi-layered limited liability company. It wouldn't take much for them to leave us with broken promises and lost jobs and tax revenue.

The Department of Energy loan that they have applied for exposes taxpayers to unnecessary risk. Two out of the three NW INNOVATIONS Global Advisory Team members had close connections with people at the Department of Energy. I have concerns that they were hired to help facilitate the loan process.

GARY LOCHE is the president of NWIW's global advisory team. He served as the Department of Commerce Secretary, and the Department of Energy's Secretary Steven Chu were both fellow members of Obama's cabinet.

DAVID SANDALOW, another NWIW advisory team member, served in senior positions at the U.S. Department of Energy, including Under Secretary of Energy (acting) and Assistant Secretary for Policy & International Affairs.

The Department of Energy loan application needs to be thoroughly investigated to determine what NWIW's information provided matches the information they have provided to the investors and the state regulators.

The Department of Ecology and taxpayers have the right to ultimately see this entire document and fact check information provided by the applicant.

The inability of high-risk projects to get private backing is a feature of a free market system, so why do we have to take the risk?

Sharon Abreu

I am a 19-year resident of Washington State, and I've been a climate change educator for over 20 years. I am of the strong opinion that the Kalama Manufacturing and Marine Export Facility is a danger to our local waters and marine life in northwest Washington State and a danger to our whole planet due to the greenhouse gas emissions of the fuels processed there. It is time to move away from fossil fuels and create well-organized, well-funded Just Transition programs to replace those jobs.

Howard Shapiro

The Pacific Northwest has been experiencing a debilitating smoke episode for the last week caused by forest fires, exacerbated by global warming, contributed to by fossil fuel extraction, processing and shipping. Northwest Innovation's application for the largest natural fracked gas to methanol plant would further contribute to this devastating problem. Their claim that they will mitigate the problem is impossible to believe since the best mitigation would be to not build this facility.

Their claim that they will be shipping the methane for use in manufacturing plastics can not be believed. There will be no way to control how they use their product once the plant is built.

It seems coincidental that a large shipping company whose ships use methane as fuel, is investing \$10 million in this methanol manufacturing venture and they claim that they will not use this methanol as fuel for their ships. Again, if they get their necessary permits and the plant is built there is almost no way that the use of their product can be controlled short of illegal usage.

Since the plastics market for their product has all but dried up, it would seem logical to deduct that the methane produced by the Kalama plant will be used as ship fuel and their claim that it won't be, is false.

Innovation works seems to again be attempting to hoodwink you and you would be within your rights to be highly offended at their supposition that you are that gullible. The fossil fuel pollution and global warming contribution of this plant would seem to be a large contributing factor for not granting your approval for this venture.

Bill Adams

Please reject the proposed methanol refinery in Kalama and deny the Shorelines Permit for the project. Why? Its voracious appetite of 130m cu. ft. of mostly fracked so-called natural gas daily, more than all commercial gas users in our state combined, would mean more fossil fuel extraction to meet that demand. To combat global warming, 97% of the world's scientific community are in full agreement that we need less fossil fuel extraction. Less to speed up the transition to a clean, renewable energy economy so that we're putting less carbon dioxide into the air. Carbon dioxide in the upper atmosphere from burning fossil fuels such as gas is now known to be the chief cause of global warming. This project is a classic case of short-term thinking. Yes, it will produce some jobs and additional tax revenue but it won't bode well for the future when the future has to be clean, renewable energy. Besides, it's a documented fact that there are up to 4 times more family wage jobs in clean, renewable energy than there are in fossil fuel extraction and infrastructure. If NWIW really wants to do something positive for our state and Cowlitz county, they'd be banking on a long-term renewable energy project instead of a refinery powered by a fossil fuel that has to be short-term if we are to effectively combat global warming. As such, please deny the project. Thank you, Bill Adams

Tylor Hankins

First, I live in Kalama, so I'll be the first to admit that I don't want to be staring at this thing in my backyard, or be smoked out by chemicals during a weather inversion.

But I think some of us are missing the bigger picture. All these numbers, charts, and graphs don't mean a thing if China continues to expand their use of petrochemical products that generate greenhouse gasses. Will methanol produced in Kalama displace Chinese use of coal reserves and petroleum products, now and forever in the future? Yeah...??? Right...

Of course Communist China has your best interests in mind. Never forget Tiananmen.

The joke's on us...

Richard Marshall

This methanol proposal is extraordinarily pessimistic. The economic analysis behind the tired fossil fuel argument of "better than the alternative" is both shoddy and speculative. There is no possible progress in this type of analysis, no faith in continued human ingenuity or creativity, no acknowledgement of technical or policy innovations.

From a policy standpoint, it is crazy to believe that societies across the globe will not demand cleaner economic processes and less pollution. Look at our own situation -- earlier this year we had an example of much cleaner air. I heard a number of people comment about how amazing it was to spy Mt Jefferson on a regular basis. And this past week, we literally have had a taste of some of the worst air pollution in the world. People everywhere want cleaner air and are going to demand of their governments less pollution.

From a technology standpoint, we can and will do better. Right now renewable energy is the cheapest form of new energy in most places in the world. What we've done with renewables is an amazing achievement of human ingenuity and hard work applied to process improvement. This methanol proposal on the other hand, is a last gasp effort of a declining industry to take advantage of excess North American fracked gas and dump it on the world markets before stricter emissions policies can be put in place. The only thing clean about this methanol proposal would be the use of our federally subsidized clean renewable electricity to run the plant. That is our energy and we have better uses including heating and cooling our homes and hopefully reducing the emissions from our cars so we can have cleaner air.

Please analyze this proposal for what it is -- an unmitigated fossil fuel export proposal with no hope of captured or sequestered emissions. Please don't rely on pessimistic speculation that lacks analytic rigor, ignores recent technical achievements in renewable energy, and dramatically discounts the basic human desire for clean air and a livable planet. Thank you.

To: Washington Department of Ecology
Re: Kalama Methanol Supplemental Environmental Impact Statement

I am writing on behalf of my seven grandchildren who are too young to speak for themselves. Currently they are being subjected to the hazardous, smoke-filled air of the Pacific Northwest, as wildfires rage across our landscape. Climate disruption is impacting their lives by preventing them from safely playing outside as they can't play outside, and more importantly the storms, flooding, mudslides and drought that are becoming increasingly severe limit their future. The planet is overheating, and NW Innovation Works (NWIW) will only make it worse . . . much worse.

If 40 percent of the methanol produced at the proposed Kalama facility is burned, as indicated by NWIW, it will yield 2 million tons of carbon pollution each year. The remainder of the methanol would become plastics in a world already overrun with discarded plastic waste. Methane gas along the supply chain to Kalama Methanol would be released into the atmosphere, increasing the carbon footprint of the project. Each methane molecule has 84 25 times the 20-year global warming potential of a carbon dioxide molecule, meaning that even small amounts of methane emissions have an enormous impact. If Washington State is to achieve its climate goal of keeping global warming "well below 2 degrees Celsius", it must deny the conversion of fracked gas to methanol.

Future energy needs must no longer be met by fossil fuels, including so-called "natural" gas, two-thirds of which in America is derived from fracking. Cleaner energy technologies are readily available, and battery storage capacity is rapidly improving. In the SEIS, NWIW identifies no specific projects or measures that will mitigate the release of methane from wellheads, from transmission pipes, and from the proposed refinery itself.

Washington's Department of Ecology needs to take a proactive position on behalf of our grandchildren and the survival of our planet. It should reject the proposed methanol refinery and deny NWIW a Shorelines Permit.

Thank you.

Emily Herbert

Thoughtful holders of the Common Good for Washington's Environment,

I appeal to your care for the well-being of all earth's creatures. Yes you have mandates for specific regulations. But there is a larger more essential duty in this time of climactic upheaval. As forces of money and self interest pursue yet another extractive polluting industry with far reaching impacts well beyond the boundaries of the project, it is time to stand for the common good. It is time to find your authority to deny any more such insults to the world that wants to continue living.

Nancy Harrison

Dear Director Watson and Department of Ecology,

I oppose this proposal to build a methanol plant in Kalama and urge you to deny the permit to build it. This would be the world's largest fracked gas-to-methanol refinery, and would clearly substantially increase emissions in WA, and would enable increased emissions worldwide.

NWIW misled your agency, and the public, about the purpose and impacts of the refinery. I am counting on Ecology to dismiss NWIW's misleading claims and accurately account for the project's upstream and downstream climate pollution.

For the community of Kalama and for our climate, the risk is simply too big. Please keep our communities safe, and keep Washington on track to meet our goals for reducing climate pollution. I am counting on you to do the right thing and stop this dirty, dangerous fossil fuel export project.

Thank you,
Nancy Harrison

Lehman Holder

My wife and I are very strongly opposed to this proposed methanol plant, as are large numbers of Kalama, WA, residents. If the plant is built, we believe increased and unacceptable levels of greenhouse gases will be the result. We also oppose the huge amount of water that would be taken from the Columbia River.

Kathleen Patton

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Smoke signals. Obvious and tragic evidence of climate change is ravaging our state. Why would we want to add fuel to these fires by fracking even more fossil fuel and creating more infrastructure for destruction???? Deny this permit. We must stop creating new avenues for fossil fuels to flow and continue to pollute our air and warm our climate.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Kathleen Patton

Merna Baker Blagg

Our world, country and state does not need an increase in hazardous pollutants. Healthy and clean air is what we all strive for and KMMEF would extremely increase the air quality to a devastating and toxic level. We are at a critical point in the climate crisis. Please stop denying the crisis and work on sustainable clean and healthy alternatives for embracing growth and economic prosperity. Please, as a concerned Gramma, born in Kelso, living in Vancouver, with 2 sons and their families living in Longview, I implore you to deny the permit for this project to move forward.

Merna Baker Blagg

Karis Cooper

No Way !!!!

Robin Donahue

NO. Please listen to those living in the community. we do not want this hazard in our city.

S Jacky

Thank you for your work to protect Washington's environment and for acknowledging that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility. Impacts include addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. While the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. Even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. Look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades.

Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated. The urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions.

I urge Ecology to dismiss the speculative basis that this project could displace even more polluting facilities. Instead, base the permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington must deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing

climate pollution.

Frank Marre

Northwest Innovation Works Proposal Kalama gas to methanol production and storage facility

Dear Department of Ecology

I oppose the proposal for human health and ecological reasons. I am a physician and public health specialist. The impact of pollution and global warming is well documented and includes increased respiratory and cardiac illness, more physician visits, hospital admissions and deaths. We are experiencing the impact right now. Thousands of people are stuck indoors, thousands have lost their homes, many have died, businesses are closed and/or lost and huge areas of forest are gone for a generation due to the increased number and severity of forest fires. We don't need more plastic either. There is an island of plastic trash floating in the ocean now and micro plastic can be found in sea food and sea creatures even those inhabiting the remotest areas of the ocean. This is not a time to entertain even more pollution. Once this plant is in place it will be there for years making the global warming recovery even harder. Public and private resources should be directed toward a green economy, not contributing to the problem that seems almost unsurmountable as it is. Thank you for putting a stop to this.

Paul Spindel

The timing of these catastrophic fires and their link to climate change is a perfect example of why we must do better. We must do things differently. We cannot support a gigantic methanol plant and the damage it will cause locally and globally. Whether the methanol will be used for fuel, or the making of plastics, really doesn't matter. It shouldn't be used in the first place. Please deny permits. Thank you.

Anonymous Anonymous

Regarding the Northwest Innovation Works – Kalama Manufacturing and Marine Export Facility SSEIS, I am submitting the following comments:

The SSEIS states that "The project would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year." as well as indeterminate upstream emissions. And yet the claim is that this project will somehow result in a net global reduction in greenhouse gas emissions. I believe that the justifications for allowing this project to move forward seems flawed and highly speculative. Particularly the notion that the People's Republic of China can be relied upon to reduce their use of coal due to their importation of methanol from Kalama. Also, I believe that the uncertainty regarding the level of upstream greenhouse gas emissions makes it impossible to demonstrate how those emissions could be mitigated.

In conclusion, I see no demonstrative proof that the Kalama facility would reduce worldwide net greenhouse gas emissions and I believe that the risks to the environment and the health and well being of local residents far outweigh any benefits.

Laura Baumgartner

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Susan Vossler

I oppose the Kalama Manufacturing and Marine Export Facility. The latest EIS did not account for the full environmental impact on all affected communities.

Ellen McCann

Heck yeah we deserve a second EIR. Why wouldn't a project of this magnitude that have a more thorough review after we are witnessing all the devastation of climate change this year...super storms, hurricanes, fires!!! We the people deserve a safe, livable planet.

carolyn atkinson

China is now considering going carbon neutral.

<https://www.euractiv.com/section/energy/news/china-considers-going-carbon-neutral-peaking-emissions/>

This move demonstrates the volatility of the fossil fuel markets and how foolish and dangerous it would be to bet on an indefinite continuation of ecocidal trends. Now is the perfect time to reject the dangerous and damaging projects of a zombie industry, before anyone has to shop their products around and pretend that they're still needed in the 21st century. Reject the Kalama methanol plant.

Diana Richardson

My name is Diana Richardson. I live in part of the territory stolen from the Chinook and Multnomah Peoples upon which their descendants live today.

"To protect, preserve and enhance the environment for future generations." Mission of Washington Department of Ecology

I write to question your assumptions, your basic assumptions, about what is at stake in the decision to permit or not permit this or any project known to contribute to the havoc being rained down on our communities at this very moment.

With catastrophic climate destabilization undeniably linked to fossil fuels, you who are appointed or elected to make choices regarding the health and welfare of the people you are responsible to must accept your moral responsibility to act in a ways that do NO harm, that only protect the ENTIRE environment--from air and water on which we all depend-- to every animal and human on earth. Anything less is blind obedience to cultural biases to which you are accustomed. I refer to the notion that there have to be losses to life in any or all of its forms, justified by allegiance to a habit of accepting there is some value higher than that of preserving and enhancing life. For that is the only way anyone could even entertain the thought of permitting a project which will unquestionably have devastating effects on our lives now and on the generations to succeed us, if indeed, they will even be able to survive.

Your mission states : to "protect, preserve and enhance the environment for future generations"! You must take into account all of the beings who are affected by your actions.

When you think about the "pros and cons" of permitting this methanol project, a calamity for all the people of Kalama, of Washington, Oregon, and far beyond our homes, do you think about the First Nations' People, the people whose humanity has been denied by the continuing colonization the dominating culture imposes, against government law, against moral law, against spiritual law? Or are these lives ignored in the calculations of decision-makers who see the issues from the point of view of What-do-we-need-and-how-do-we-get-it? The point of view of the conquering nation.

We need to acknowledge the truth we do not want to see. Are you not charged with protecting, preserving and enhancing the environment for future generations?

As a woman familiar with the violence perpetrated upon the women of the communities through which the pipelines are laid, I must tell you this, though you will not want to hear it:

There are always the men who are not part of the communities where they are hired to build infrastructure for the substances illegally and immorally ripped from the entrails of our Mother Earth to be extracted for personal profit at the expense of the people.

Numb or dead to their feelings for the life that beats in every human heart, these men act out the brutal rape and pillage of the Earth upon the innocent, unprotected women they can so easily take for their own sad, brutal despair. Do not turn away from this truth: This is what you accept and authorize if you permit this project.

I implore you to find some human feeling in your own heart...a feeling which recognizes the hurt

and pain, the terror and shame of sexual violence from which we women never do recover if our lives are not taken outright.

What is the true price of agreeing to the realization of this project?

I ask you to get out of your head and into your heart. To respond and to act as a real human being. What would that mean for the community you are sworn to serve? What would that mean for you?

Brian Davern

There are many reasons to oppose this project and deny the permit applied for. Conversely, there are few and weak reasons to approve it. I'll only list some important objections there are to this project and concentrate on the most important reason to reject it... proponents can insert their arguments for it without my assistance -- as I've noted, they are few and weak.

The Port of Kalama (POK) site is far too small for the size of the intended plant size and product volume. No other in operation elsewhere matches its size or uses such a small parcel. This site is directly downstream and very close to the mouth of the Kalama River, host stream to ESA listed salmon and steelhead. The shoreline disruption caused by pier construction, then large ship movement, as well as river contamination from both the product spills and the ships would be a constant threat to rearing, outmigrant and adult fish. Plant operation will create a micro climate due to the injection of heated gas release, condensation and precipitation that will lower visibility, pollute water, shoreline and local landscapes downwind (meaning, to the north in winter, to the south in summer). The removal of 5M gallons of water/day beneath the Columbia streambed, assumes that it's surplus water... it is not. The supply of liquid gas used to produce methanol must course through steep, private residential properties that must shoulder the risk of leak and fire without benefit or consent. The price and supply consequences to regional users of liquid gas again provides no benefit in trade for reduced supply and higher prices. An additional assumption with this application is that the area's industrial past is also its future. The rejuvenation of the city of Kalama and the arrival of McMenamin's hotel and restaurant, is tangible proof that it is not. The proximity of the proposed plant to both the townsite and the residential community (primarily now there for the natural, rural character of living conditions) makes a future of heavy, around the clock, industrial activity much more than objectionable.

Finally, the main and by far the largest objection to this project is the very real specter of a changing climate that we've been warned of, been taught its human contributions and are now living in its effects (as numerous and widespread wildfires in the Northwest ravage the land and the plants and animals, including humans, that have made it their homes).

So there is a choice to consider, one of which is smart: POK can get in front of the climate reality we are living in and invite industry that HELPS moderate climate change... or sadly, make a huge contribution to accelerating the harmful effects a hotter planet imposes on all of earth's inhabitants. I beseech DOE to select smart and reject this proposed plant.

Joel Carlson

Fracked gas or methane is extremely harmful to our environment and must be banned. New construction must be electric only with heat pumps, etc. We must also ban the fracked gas LNG projects in Tacoma and Kalama. It is vital that we get this done now!

Kristen Meston

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

There is no reason to create new polluting facilities rather than working to eliminate them. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Fred Suter

My name is Fred Suter. I live in Vancouver, WA.

We are being told that the Kalama Methanol Refinery will produce over 4.5 million tons of GHG emissions every year and this will make it one of the largest polluters in the State of Washington.

We have sadly been reminded of just one of the consequences of GHG emissions. We have just experienced the worst wildfires in our history and the wildfire season isn't close to being over.

If you look on a map of the United States, the entire west coast appears to be on fire. We have seen over 40 large fires burn across CA, OR, and WA - destroying over 475,000 acres (so far). Thousands of our neighbors have been forced to evacuate from their houses and thousands have returned to the charred remains of what was once their homes. Dozens of towns have been destroyed.

We are told that hotter summers, dryer weather, and longer wildfire seasons contribute to the conditions that cause these monster wildfires. Hotter summers, dryer weather, and longer wildfire seasons come to us as a result of the impact that manmade GHG emissions have on the climate.

There is a connection between our quality of life as residents of the State of Washington and the construction of this methanol refinery. Yet wildfires are considered an extranality in the economic analysis of this methanol refinery.

The wildfires that are presently burning out of control have already caused billions dollars of damage. The economic analysis presented in the EIS doesn't take any of these costs into account. The economic analysis presented in the EIS grossly under-estimates the actual costs of constructing this refinery. The economic analysis does not allow decision makers the opportunity to evaluate the true costs of this refinery.

I urge you to include the costs of ALL GHG emissions in the EIS. It is clear to me that the construction of the Kalama Methanol Refinery runs counter to every future objective that the State of Washington has stated to combat climate change and preserve our quality of life.

Just say NO to fossil fuel expansion.

Sincerely - Fred Suter

Hi My name is Tina Brakefield. I live in Vancouver and work as both a stay-home mother and run a sustainability blog. I have come here today to talk about the methanol refinery project.

I am deeply concerned and angry that this is even being considered. We are just now starting to see the end of the worst wildfires in the PNW. We are witnessing nearly 90 large wildfires in 10 western states, at least 35 deaths, and millions of acres destroyed. My family and all of the West Coast has been breathing this air that has gone off the charts in the last week with a high of at least 635 AQI.

Now while climate change itself didn't directly cause the fires to start, climate change has significantly increased the risks. According to the USDA [projections show](#) that an average annual 1 degree C temperature rise would increase the median burned area per year as much as 600 percent.

And while record breaking wildfires destroy the West Coast, 5 tropical cyclones are simultaneously moving through the Atlantic which has only occurred one other time in recorded history. And tropical storm Sally hit the Florida Alabama border just today, unleashing 30 inches of rain in four hours.

But despite all of this you are seriously considering building the world's largest fracked gas-to-methanol refinery in SW Washington. Ecology's analysis demonstrated that the project would produce 4.6 million tons of carbon pollution each year, or more.. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C.

Why are you even considering this? We should stop wasting time and resources in expanding our use of fossil fuels when these resources could be used in developing clean energy options. This choosing the "lesser of the evils" or "displacing" dirtier fuels approach isn't and shouldn't be an option anymore. I call on the Department of Ecology to reject the methanol refinery, and to deny the Shorelines Permit for the project. Thank you.

Cal Van Zee

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

This project will use more fracked natural gas than all of the gas power plants in the state, combined.

This is clearly a project for long term contracts to burn Canadian oil sands and fracked gas with their own devastating impacts on those lands.

And we the taxpayers of Washington state will subsidize those contract holders for a few dirty industry jobs.

We should tax those companies to pay the full cost of gas extraction and carbon released, starting at \$20/ton.

Will investors still want to build this project if they have to pay the full costs to us?

Hire those workers as the new green economy by charging coal, gas and oil a true carbon tax. Consumers will switch quickly to sustainable power and the products and services needed will be ready.

Please deny this permit for me and my grandchildren

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Cal Van Zee

Judith Wood

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. We have no business building this kind of destructive infrastructure. Our investments must be in health and wellbeing for people and the planet, not profit.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. Deirdre Gabbay

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Twenty years ago would have been the correct time to phase out the burning of fossil fuels to protect our climate from the build up of dangerous greenhouse gasses. It is unconscionable that it was not done - and we are feeling the direct effects of that inaction today - in the wildfires, storms, extreme heat in urban areas, the loss of glaciers and ice caps, and the sea level rise that will soon drown the world's great cities.

If we fail to act again today, when the devastating effects of last year's poor choices are upon us, then what is the point of ever educating another child to study science, of ever teaching another human being to care about the future, or giving any governing body the responsibility to set policy that will affect the future health of the planet?

The answer is: there will be no point to your very existence as a Department of Ecology if you approve construction of this disastrous project.

We the people have given you the authority to say "no" to this fatal industry. You must use it.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. deirdre@gabbay.org

John Harris

Please do not approve this. In time of global warming and unprecedented fires, we do not need to add more methane into the atmosphere.

Also, we do not want to give the Chinese any foothold in our area. They are not our friends.

Priscilla Martinez

We need to take better care of what is left of our environment, for people, wildlife, and marine life.

Joseph Hiss

Please do not approve the Second Supplemental Draft EIS for SEPA on this project. Any proposed action that locks WA and China into 40 years of fossil fuel mining, transportation, burning, or other industrial use, is unacceptable to me. I base this on the lectures I heard over my career as a local fish and wildlife biologist, along with my work as a volunteer environmental educator, and my extensive reading on the subject of climate change. The charts given at the beginning of your Sept. 17 presentation failed to support the project's reduced fossil fuel consumption because the baseline was improperly chosen. The real question is why Ecology would allow 40 years of fossil fuel pollution when the world cannot handle the pollution it is already getting. Do not approve this document, and, if you can, recommend this project be cancelled.

DEREK DEXHEIMER

The Kalama ethanol plant should not be built. Ecology's own analysis shows the plant would emit a minimum of 4.6 million tons of GHGs annually for 40 years. This level of climate pollution is inconsistent with a livable climate.

In addition, the plant would use fracked gas piped in from other western states, providing a market for this disastrous form of pollution.

Due to its inherently destructive nature, this plant cannot go forward.

kate lunceford

I oppose the construction of Kalama Manufacturing and Marine Export Facility. The mining, transport and use of natural gas is destroying our planet. We must stop using fossil fuels immediately to have any hope of reversing climate change. It takes the planet billions of years to sequester pollution. We must stop digging it back out!

Richard Schoonover

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Eric Haskins

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Mark Uhart

My name is Mark Uhart and I am a retired US Army career officer. My wife and I live near Kalama in the foothills overlooking the Columbia River. We are against this project. We purchased this property so we could enjoy the unobstructed view of the Columbia River and enjoy recreation and dining in the local area. We walk, hike, bicycle, and have kayaked the Columbia River. One of my hobbies is wildlife, landscape and astrophotography, all of which will be affected by this project.

Most importantly, I am concerned about the future of my children and grandchildren. It's hard for me to comprehend why anyone in this area would support a project that will adversely impact their health, safety, and long-term quality of life. The short-term economic gain will be offset by 40 years of dirty air and water, noise and landscape pollution, depletion of the Columbia River-Kalama River aquifer, and a definite impact on our climate. I grew up in southern California next to oil fields and refineries. I've lived in Texas and observed the stinky and noisy refineries along the coastline. Trust me, we don't want the smell, the noise, the air and water, and landscape pollution of this facility.

I served 21 years as an active duty officer in the Army from battery to Corps Artillery level, and an assignment in special weapons quality assurance. The strategic objective of our adversaries, Russia and China, were always part of our professional development. I was, and still am, very aware of the strategic implications of foreign countries' attempts to get deeply embedded into our financial system in order to influence both economic and military outcomes. One author says it best, "The signs that China is gearing up to contest America's global leadership are unmistakable, and they are ubiquitous." They are doing it with our money and our natural resources. When will the average Washington resident wake up and smell the coffee?

It really bothers us that the US citizens of Northwest Innovation Works (NWIW), the Port of Kalama and the Cowlitz County commissioners, would support a project that is owned by the Chinese government; that will be financed primarily by US Government and Washington taxpayers; that will pollute our air and water; and only add to the devastating effects of anthropogenic (human-caused) climate change. We will bear most of the financial and environmental risks associated with this project while they take in the profits and improve their position toward world financial, economic, Southeast Asia maritime and political dominance. Money talks and the Chinese government are throwing a lot of money into marketing this project in its quest to control much of the world's technology and energy natural resources by 2030.

An assumption that was not stated, but can be inferred from these EISs, is that the international community will choose not to address climate change and regulate GHGs. If every country that wants to improve their energy position and economy, like China and the US, took the same approach purported in this report, then the earth is doomed. The assumption is that if this plant is not built herein Kalama, it will be built elsewhere. The law of supply and demand shows that if there is a shortage of a commodity, and prices increase, people will use it less and seek alternate technologies. We saw this before the fracking boom when gas prices went up. That drove better fuel efficiency and new technology (all electric cars, hybrid vehicles, and now fuel-cell vehicles.) Denying these projects will constrain these fossil fuel supply channels and force countries to develop clean, non-fossil fuel, energy alternatives.

I read the SSEIS and the voluntary mitigation framework presented in Appendix D is laughable. By using the term "in-state", NWIW is not willing to mitigate GHGs outside the state of Washington. This includes the upstream fugitive methane and CO2 from the methanol burned in transport to China, and as a fuel or in olefin production. I will address this further in another comment.

This project is a climate killer and the only responsible decision is for Ecology to deny the shoreline permit.

Mark Uhart
LTC, USA Ret.
Kalama, WA

Cynthia Thornton-Tang

I would like to urge the panel to deny the permit for the refinery.

I am a mother and a grandmother and a lifelong resident of the Pacific Northwest. I am concerned that there will be pollution and environmentally harmful effects at every stage of this project: from extraction, to transport, to storage, to refining, to burning fossil fuel, to plastics which become micro-plastics and have been found everywhere, including in our food. I remind the panel that we are in an earthquake region, plus we have irreplaceable and vulnerable natural assets: our waterways, our air, our land.

This project, if approved, would give short-term financial benefit to Northwest Innovation Works and its investors, with the long-term costs passed on to citizens of this planet, a burden that would be borne most particularly by those who have the least. There will be leakage, there will be accidents, there will be clean up costs, there will be pollution either by methane gas or micro-plastics.

In our current year of trauma with COVID, economic upheaval, and heightened awareness of social and racial inequities, it is clear how morally wrong and economically short-sighted it is to approve fossil fuel projects that allow corporations and investors to reap the profit and walk away from the costs.

We need to make choices now that will give us all a better future.

I urge the panel to reject the permit request.

Thank you,
Cynthia Thornton-Tang

Jennifer Vinnard

Speculations about this proposed methanol plant supposedly displacing coal burning plants is absolutely ludicrous and unfounded! Not one single coal to methanol plant has agreed to reduce or stop production, and with China's high demand, it's foolish to approve the permit with zero indication that even 1 coal to methanol plant would be closed...it's a scam, and people who actually live here are finally realizing that. 4.6 million tons of ghg emissions PER YEAR, which is still not an accurate estimate, highly underestimated, regardless it is NOT the direction we need for our state, our country, our planet. China will reap the rewards while Kalama, Cowlitz County, Washington and the world suffer the consequences! NWIW has been consistent on one thing..lies..ignoring their intentions to use the methanol for fuel, the pollution, the negative impacts on tourism, the amount of fracked gas it'd need daily, on and on the cons go, ultimately there's nothing about this proposed methanol plant that fits our environmental standards and goals, this would set us back for decades! More people oppose this project than support it, and we need Ecology to do what's best for Kalama and Washington, PLEASE deny the permit! We're counting on you :-)

Thank you

I was born and raised in Cowlitz County. I moved away for work for about 10 years but returned 16 years ago. Local industry is the life blood of Cowlitz County. Industry and the development of industrial projects in this area has put food on many family tables and sent a number of kids to college as well as providing a living income for many. I believe in smart, clean & well planned industrial projects. I have been following the NW Innovation Works – Port of Kalama project since it was first proposed. I feel this project would be a tremendous benefit to Kalama and Cowlitz County.

I am now a member of the local Kalama community, a Cowlitz District 5 Volunteer Firefighter Lieutenant and a Superintendent for JH Kelly, I support this project. We have lost too many industrial projects or have been faced with unnecessary delays due to environmental banter from individuals and/or groups that do not live or work where these projects are proposed. I believe we can build responsible manufacturing facilities and create local family wage jobs as well as give the local community the opportunity to grow and benefit from additional tax revenue and build a better overall economy for local families. Please hear our voice and do not delay permitting on this project. **Below is a copy of some key benefits that would result from this project moving forward.**

Economy:

- **Jobs:** 1000 jobs during peak construction (2+ years) and nearly 700 direct, indirect and induced jobs will be created during operations. The average estimated salary will be \$71,000 annually, roughly \$10,000 above Cowlitz County's median family income and \$24,000 higher than the median annual wage in the County.
- **Spending:** During construction, nearly \$700 million will be spent on local labor, goods, services. This will bring over \$620 million in direct economic impact and nearly \$500 million in indirect economic impact.
- **Tax Revenue:** NWIW will pay \$57.9 million in state and local taxes during construction and \$30-40 million annually during operations. \$48 million in sales tax receipts will go to the state and county during construction. This will strengthen state and local authorities to build new community facilities, enhance local infrastructure and improve our schools.

Safety:

- **Safety Systems:** To significantly reduce the chance of spills, fires and explosions, all natural gas, chemical processing, and methanol production will be managed through an enclosed process with state of the art safety systems.
- **Emergency Response:** NWIW will work closely with emergency responders and regulatory agencies to develop contingency plans that include dedicated and trained on-site fire brigades and equipment to respond to any potential emergency.
- **Responsible Care™:** NWIW is committed to the training of its workforce and contractors to the standards and processes of the Responsible Care™ program, a comprehensive safety, health and environmental program, as described and developed by the American Chemistry Council
- **Worst Case Analysis:** The opposition has repeatedly deceived the public about explosions, fires, and a theoretical 6-mile blast zone. Their arguments are based on impossible physics and

frightening youtube videos of incidents that have zero relation to a methanol plant. Here are the facts -- Extensive and conservative modeling conducted by risk assessment experts shows that a worst case incident (fire, explosion, or spill) at the methanol plant would not result in serious injuries or health impacts anywhere offsite

Environment:

- **Air:** By using natural gas as a feedstock and implementing ultra-low-emissions technology (announced in August 2015), carbon emissions will be reduced by up to 90% compared to coal to methanol manufacturing.
- **Air:** The Kalama Facility Final Environmental Impact Statement states that air pollutants generated by the plant will “comply with emission standards”. The detailed analysis demonstrates that all emissions of air pollutants from the plant itself would be sufficiently low to protect human health and safety in accordance with Washington state law.
- **Natural Gas Infrastructure:** The Kalama facility will require a 3.1 mile natural gas pipeline extension. The current capacity of natural gas is more than adequate to supply the facility contrary to the opposition’s fabrications that suggest new infrastructure will be required.
- **Water:** NW Innovation Works is the first company along the Columbia River to invest in Zero Liquid Discharge technology (announced in October 2016). With this innovative technology, all facility wastewater discharge into the Columbia will be eliminated. 100% of the wastewater will be recycled and reused in the facility. Additionally, usage of ZLD will reduce raw well water usage at the Kalama Facility by over 150 million gallons annually.

Feel free to contact me with any questions.

Thank you,

Mark J. Smith
Superintendent
Direct (360) 577-5578
Cell (360) 703-4021

“Plan your work, work your plan”

carolyn atkinson

<https://www.cbsnews.com/news/new-climate-change-report-human-civilization-at-risk-extinction-by-2050-new-australian-climate/>

The SEISS does not account at all for the projected global political instability within this project's lifespan and the impacts of this on the project's proposed market. As facilities like these are identified as drivers of mass human casualty, they will also become terrorist targets as instability increases. Don't build the methanol facility.

Regan Fisher

I am writing to express my strong opposition to the proposed methanol refinery in Kalama.

This project would cause millions of tons of greenhouse gases to be emitted and pose a danger of pollution of the Columbia River. I am especially concerned about damage to the river, as the Columbia is a vital resource and connector of communities within our region. Native American communities rely on it for fishing, and pollution from the refinery could further damage the salmon population, which is such a vital resource in our region.

This refinery would use more fracked gas than all the gas-fired power plants in Washington combined. This stark increase is appalling, especially considering Governor Inslee has strongly positioned himself and the state of Washington as needing to urgently address climate change and move away from reliance on fossil fuels. This project would obviously be a move in the wrong direction.

I am also concerned about the gas pipeline that would be necessary for this project. It brings with it a huge risk of spills along the way, as well as damage to the communities along its path.

The EIS that was completed for this project is incomplete. It does not sufficiently address the environmental impacts of the project. The supplemental EIS was also inadequate. It is clear that there is bias involved in this project (with the stakeholders and backers), and it is unconscionable that the decision makers have not been presented with the accurate evidence of what sort of environmental damage this project would cause.

I request that the Department of Ecology deny the permit for the refinery.

Karen Ashford

Dear Concerned (I hope)

I have lived here in Portland, and now own a home along the Little Kalama River Rd. I have asthma, and will be DIRECTLY impacted if this plant is built. I wonder if you have been updated about the plastic in our food, bodies and oceans that is harming all wildlife, including us? And in our air? Is it true this plant would put into our air 5x more diesel pollution than state guidelines for air toxics? How much pollution will all those tankers put in the air in their constant trips to Kalama and China? AND the daily toll on my lungs...hazardous air pollutants including ammonia, carbon monoxide, nitrogen dioxide. You've heard all about it, but do you care? Is this what Washington State wants? WHY does Cowlitz county have to take on this burden (so far from Seattle metro, very nice) when we have so much more pollution than any other county with our size population. Nice to have a few more jobs, but perhaps China needs to find another source. Of course US corporations (partially owned by China?) want to sell gas, and make money. We aren't even keeping this product in the United States! What is going on here, is THIS what is important for our future-plastics??? What about the environment and our health. JOBS always win out, don't they. Who cares about my lungs.

WE DON'T NEED ANY MORE AIR AND WATER POLLUTION IN WASHINGTON STATE!

Heaven help us, Karen Ashford

Julie Martinson

Washington State must reject this proposal that would build and operate the world's largest fracked gas-to-methanol refinery in Kalama.

I have lived here my whole life as a 4th generation Washingtonian. I grew up camping and exploring the mountains, rivers and ocean. I've been increasingly concerned about the accelerating speed of climate change. I've read a great deal about the overall effects of fracked gas in its whole lifecycle, from drilling, damaging groundwater and polluting aquifers, and causing earthquakes (particularly in Oklahoma). Fracking causes huge releases of methane both at the well sites and throughout its transportation lifecycle, through pipelines or by truck or train. The potential for explosions and spills in the communities it passes through, and is stored in, is too great a risk. This project uses fracked gas, and we need to turn from fossil fuels to creating more truly clean energy to reduce greenhouse gasses which are severely damaging our atmosphere and earth systems.

If this plant were approved, it would necessitate expanding the capacity of pipelines to the refinery, while we are committed to reducing greenhouse gas emissions, instead. This is a Chinese-owned company, which wants US to bear all the suffering from the pollution and dangers, while using OUR resources of water and electricity (and fracked gas) for their methanol, to be shipped back to China. This is like a sad cartoon: 'What's wrong with this picture?'

Washington State has committed to cutting our fossil-fuel emissions, so we must stop this project NOW, to protect our lives and health and the future of our beautiful natural world for all of its precious living creatures.

I'm fighting to protect what is sacred and beautiful. We need to keep our communities safe and healthy. We have to take a stand against fossil fuels now, and reject this project entirely, once and for all.

Mason Evans

My name is Mason Evans

I am the President of JH Kelly – a proud union construction firm headquartered in Longview WA

I value the environment and support actions that reduce global greenhouse gases - particularly the use of transitional feedstocks and new manufacturing technologies

I support the Kalama Methanol Project because:

- It brings much needed jobs to Cowlitz County
- The project incorporates important features that benefit the local environment such as zero liquid discharge, ultra low emissions technology, and a commitment to mitigate for WA air emissions
- Most importantly, the project reduces global greenhouse gases

After reviewing the supplemental EIS, I find it to be comprehensive and utilize a valid methodology to evaluate the project.

For these reasons, I encourage the Department of Ecology to accept the conclusion of the EIS and issue the Shoreline and other necessary permits for the Kalama Methanol Facility.

Thank you

Lori Howell

Washington Department Of Ecology,
I assume you wrote your mission statement,
your core purpose and values.

Let me remind you what you wrote.

PROTECT

PRESERVE

ENHANCE

Washington's

LAND

AIR

WATER

for current and future generations.

Based on YOUR Mission Statement I trust
you will deny NWIW the permit they seek
for their proposed methanol refinery in
Kalama, Washington.

Kevin Walsh

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Julie Glover

I am very upset that Northwest Innovation Works, LLC. proposes to develop and operate a natural gas-to-methanol production plant and storage facilities on approximately 90 acres at the Port of Kalama. THIS IS CRAZY! Methanol will be loaded on to ships at a new dock that will be owned by the Port and transported to Asia. SO WHY ARE WE POLLUTING OUR OWN LAND AND AIR SIMPLY TO BENEFIT CHINA?

The Second Supplemental Environmental Impact Statement focused on fully analyzing greenhouse gas emissions from the proposed Kalama methanol facility, looking at impacts from upstream emissions, such as the greenhouse gases that escape from natural gas wells and pipelines, direct and indirect emissions produced at the facility, and downstream emissions from transporting the methanol to its intended destination in China. IT MAKES NO SENSE TO ME THAT WE WOULD WILLINGLY UNDERGO ALL THIS POLLUTION FOR THE BENEFIT OF A FEW MONEYMAKERS, BUT NOT FOR THE AMERICAN PEOPLE WHOSE HABITAT IS BEING ENDANGERED!

John Flynn

I am a resident of Kalama, WA. I frequently fish the Columbia River both upstream and downstream of Kalama, as well as the Kalama River.

I oppose the proposed construction and operation of a fracked gas to methanol refinery on the shore of the Columbia River primarily on environmental grounds and secondly on aesthetic grounds. The negative impacts this project would have on our environment and health is even more critical today considering the catastrophic wildfires we are currently experiencing in Washington, Oregon and California, with their associated loss of life and property.

This refinery would emit 4.6 million metric tons of greenhouse gas emissions annually into our already polluted atmosphere. In addition this petrochemical refinery would emit 53 tons of toxic and hazardous chemical pollutants into our air per year along with 62 tons of fine particulate matter per year. It is imperative upon us that we reduce greenhouse gas emissions and toxic air pollutants rather than increase them.

The vapor cloud from the cooling towers of this refinery from which millions of gallons of water will be evaporated would reach between one half to three quarters of a mile high and one quarter to one half mile wide. I cannot see myself, in my boat, fishing with family and friends in the shadow of the worlds largest fracked methane gas to methanol refinery.

I sincerely urge the Department of Ecology to deny any and all permits for this refinery project. Thank you.

Nancy McMahon

The science is in and we have very little time left to transfer our world from fossil fuel dependence to renewable sources of energy. We have begun to make headway in this direction, but this facility would be a giant step backwards.

The project would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year. The Kalama facility would be one of the 10 largest sources of greenhouse gas emissions in the state. Northwest Innovation Works has said that it will mitigate all of the facility's in-state emissions.

Danny Percich

Don't allow the world's largest fracked gas-to-methanol refinery to harm our climate and Kalama! Washington should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama. NWIW misled your agency, and the public, about the purpose and impacts of the refinery. We are counting on Ecology to dismiss NWIW's misleading claims and accurately account for the project's upstream and downstream climate pollution.

For the community of Kalama and for our climate, the risk is simply too big. Please keep our communities safe, and keep Washington on track to meet our goals for reducing climate pollution. We are counting on you to do the right thing and stop this dirty, dangerous fossil fuel export project.

In this moment of a top down attack against science, we need to stand up for science and look hard at how a this refinery will pollute and effect our communities. As a father of 3 and owner of a small farm, we need to protect our future.

Sincerely,
Danny Percich

Don Steinke

Hello, I'm Don Steinke, retired science teacher, 43 years mostly at Fort Vancouver High School. NEPA was signed by Nixon 50 years ago, because it had been difficult to get all the facts related to a project. NEPA requires you to prepare an EIS that tells us the whole truth, and nothing but the truth. But you didn't do that.

You gave us part of truth and a lot of speculation. I'm not even sure you read your own EIS. Did you write it? Were the remarks about displacement potential your own or did they come from the proponent?

The natural gas industry is the absolute master of deceit and lies. They persuaded us that most plastic is recycled when it is not. They are advertising on TV and FB right now about being the pathway to a clean and sustainable future. When all the emissions are accounted for, gas is nearly as bad as coal and methanol is worse.

Methanol is the opposite of a value-added product. It's a pollution added product. Better to use the fuel at the source than to add the pollution generated by a methanol plant.

The gas industry has known about climate change for decades but are engaged in a "campaign of deception" to help sell their products. They have fooled most of the public and the elected officials. They fooled the green groups as well, until we learned about methane leaks in 2014. And they are trying to fool you with their displacement theory.

Don't believe anything they say!

Get rid of the speculation in the EIS. Protect our children's future and say NO to our destruction.

Teresa Flynn

My family lives in Kalama, Washington. We are against the proposed Methanol Refinery. we have been fighting this for five years. Next time could you just tell them At the beginning of the process that it is not acceptable and be done with it. Thank you Teresa Flynn Kalama, Wa.

Lisa Downey

I strongly oppose the construction of the Kalama Manufacturing and Marine Export Facility. Increasing methanol production does not align with Washington State ethics and priorities. During this season of extreme wildfires due to global warming we need to be creative about protecting all the natural resources we have. Fracking is not good for our wildlife. Methanol is not good for the environment. Shipping it overseas and the added transportation impact on the environment is an added insult. Instead of selling our resources for a quick buck we need to preserve and protect our state's beauty for the younger generations. Please do not approve this project.

Michelle Sheldon

Don't allow the world's largest fracked gas-to-methanol refinery to harm our climate and Kalama!

Washington should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama.

NWIW misled your agency, and the public, about the purpose and impacts of the refinery. I am counting on Ecology to dismiss NWIW's misleading claims and accurately account for the project's upstream and downstream climate pollution. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

For the community of Kalama, neighboring communities, and for our climate, the risk is simply too big. Please keep our communities safe, and keep Washington on track to meet our goals for reducing climate pollution. I am counting on you to do the right thing and stop this dirty, dangerous fossil fuel export project.

Jean M. Avery

Proponents of the NWIW project say this refinery would be a good for jobs and tax revenue. But, as we choke on hazardous air pollution, why would we invite more pollution into our region -- for 40 years?

According to Sierra Club, this plant would consume more fracked gas than the region's largest cities combined, making it the largest climate polluter in the State by 2025.

So, why should this project be considered at all? -- especially when mitigation seems vague and minimal?

The Second SEIS includes more than 100 pages of charts, graphs, tables, and data. And yet, there are only two pages on "Significant Impacts and Mitigation."

An appendix mentions "voluntary" emission reduction "to the extent possible." There is a vague reference to carbon markets.

So, questions remain:

1. Do the words "voluntary" and "to the extent possible" imply that NWIW does not perceive mitigation as a firm obligation?
2. By carbon markets, does NWIW mean purchasing carbon offsets? This would not reduce actual emissions.
3. Does Ecology have resources to oversee this project? Instead, Ecology could focus on proactive measures for a clean-energy future.
4. Forty years is plenty of time to enact clean-energy programs. When NWIW claims its operation is less polluting than other sources, it assumes other fossil fuel sources.

I believe we are on the cusp of a clean-energy future. It is time to say good-bye to fossil fuel projects. Please deny this project.

(Testimony at 9/17 online hearing)

David robinson

Thank you for accepting my comments on this SSEIS. The Kalama methanol is an abhorrent idea given the cumulative effects of past centuries of fossil fuel use. I'm convinced that the future of humanity rests on the ending of all fossil fuels exploration and infrastructure projects! That fossil fuels will have to be left in the ground. That a war time effort to replace fossil fuels with solar, wind and other infrastructure is necessary immediately to protect humanity from climate crisis! That anybody involved with this and other exploration and infrastructure projects now and into the future will be found in a future court of law to be guilty of genocide against humanity for failure to protect humanity from climate crisis!

I realize that the Department of Ecology is under pressure to cross all the t's and dot all the i's, but it's time to SAY NO to any further thoughts of allowing this and other fossil fuels infrastructure to go forward. There has not been any true cumulative effects analysis for fossil fuels in the past and any future analysis should remain locked up and shelved given the scientific information already available on the effects of the use of fossil fuels on the climate to date! This and similar projects have to cease immediately and regenerative energy projects given the highest level of priority. For the future of humanity, denying this fossil fuel infrastructure will be a step in the right direction. Thank you for accepting my comments today.

Sandra Oliver-Poore

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Marge Schwartz

Methane is toxic and a greenhouse gas. Please protect us from the release of methane.

Melissa Brooks

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. I do not want to add to carbon emissions.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms. Melissa Brooks

Jessica WINTER-STOLTZMAN

No new fossil fuels facilities. It's past time to draw the line and stop the destruction of our planet. This summer's devastating fires and abysmal air quality show what future life will be like if we don't turn a corner and change our ways. We have to reduce use of fossil fuels. Do not allow this facility to operate.

JOANA KIRCHHOFF

The Portland Raging Grannies stand in opposition to the Kalama project proposed by NW Innovation works. The history of the project is filled with false reports, shoddy science and a revolving door of investors - making it a less than desirable business for Kalama. The environmental impacts are numerous and I'm sure you will have many comments on those impacts. We want to focus on the instability of the company and the fossil fuel economy at this time. Please add that to your calculations so that Kalama is not left holding the bill for the facility. Kalama does not want a superfund site!!!

Jynx Houston

I ABSOLUTELY OPPOSE THE PROPOSED KAMALA METHANOL REFINERY. IT WOULD BE DISASTROUS FOR THE ATMOSPHERE—FOR THE HEALTH OF PEOPLE & THE PLANET.
MOREOVER IT WOULD BE COMPLETELY UNNECESSARY.

Nancy Helget

The Department of Ecology should deny the NWIW permit because GHG emissions attributable to the facility are significant and NWIW's proposed mitigation plan won't reduce GHG emissions in Washington.

The Department of Ecology has meticulously analyzed and identified the GHG emissions NWIW's facility will produce. Ecology finds GHG emissions attributable to the facility would be "significant". However, Ecology also finds the emissions are "capable of being mitigated." SSEIS ¶ 1.5.2.

Ecology's conclusion NWIW can mitigate its significant emissions relies on NWIW's proposed Mitigation Framework, SSEIS Appendix D. Ecology concludes "... the mitigation framework would establish an annual greenhouse gas emission reduction obligation equal to instate emissions as determined by Ecology's GHG reporting rule, to the extent possible." SSEIS ¶ 1.5.2.

I'm not encouraged by the vague "to the extent possible" language. The SSEIS doesn't identify what might or might not be possible. To be effective, any mitigation effort must be possible.

Even if "possible", NWIW's proposed mitigation efforts would do nothing to actually reduce overall GHG emissions. NWIW doesn't propose to actually reduce any of the GHG emissions attributable to its facility. Operation of the facility will cause millions of tons of GHG pollution every year for 40 years.

NWIW's mitigation proposal is to invest in projects that may or may not result in GHG emission reductions from other sources. Basically, NWIW will be allowed to significantly increase GHG emissions in Washington in return for a promise to voluntarily invest in projects elsewhere that are actually trying to reduce GHG emissions. When considering the increase in GHG emissions attributable to the NWIW facility, a plan to possibly offset those emissions won't ever reduce overall GHG emissions.

In contrast, not permitting the NWIW facility will assure NWIW can't pollute to the tune of millions of tons of GHGs for 40 years. If NWIW doesn't build the facility, there will be zero new GHG emissions attributable to the facility. If NWIW doesn't build its facility, other projects can still work to reduce existing GHG emissions, resulting in an overall reduction of GHG emissions.

The Mitigation Framework NWIW proposes is inadequate for other reasons. All NWIW mitigation efforts would be voluntary and the framework doesn't provide any enforcement mechanism. NWIW doesn't propose to enlighten us about the nuts and bolts of its proposal until after the environmental review is completed. SSEIS, Appx D, p. D-2.

While the framework describes involvement of a Board and environmental groups, the framework lacks an explanation of how the board would operate, how the board would be appointed, and/or how the board would compel compliance with its decisions. Any potential enforcement would occur after NWIW doesn't meet its voluntary mitigation goals, and while NWIW's significant GHG emissions continue.

I live in southwest Washington. Although the Mitigation Framework prioritizes using its voluntary investments in Southwest Washington and then Washington, there's no requirement that all or even most investment be in Southwest Washington or Washington projects.

Washington is committed to reducing GHG emissions on a specified schedule with specific benchmarks. The benchmark reductions won't be easy to meet. NWIW's facility would be responsible for "significant" new GHG emissions over its 40 year lifetime. Because the mitigation framework is only a commitment to offset other GHG emissions, and because operation of the facility will never result in any actual reduction of GHG emissions, NWIW's proposed facility would set back the state's efforts to meet the statutory benchmarks.

The effects of climate change in our state, region and country have been starkly evident these past few months. NWIW's Mitigation Framework is deficient. Even accepting that NWIW will meet its voluntary commitment to mitigate as the framework describes, the fact remains that this facility will be responsible for "significant" GHG emissions, not just in one year, but in every year over 40 years the facility remains in operation. The "significant" emissions attributable to the NWIW facility will negatively affect me and all Washington residents.

The Washington permit approval process should protect Washingtonians. The SSEIS reliance on NWIW's deficient mitigation plan doesn't protect us. The Department of Ecology should deny NWIW's permit.

Kristen Daley Mosier

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive. If the experience of ten consecutive days living under unhealthy air during a pandemic that literally takes people's breath away--if all that is not motivation enough to pursue clean energy, then the voices of the people are in vain.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

halvor1895@gmail.com

Nancy Helget

The SSEIS is flawed because its conclusion relies on a speculative assumption. The SSEIS relies on the assumption the NWIW facility will prevent utilization of other more polluting processes, particularly in China. SSEIS 3.5.1.4.

The SSEIS admits its assumption is based on "current" sources of methane. SSEIS 3.5.1.4. An assumption based on current data doesn't account for future development of alternative materials and processes.

Even if the SSEIS assumption has some validity based on today's technological information, there's no way to predict what alternative processes or materials will exist or could be used in the next 10, 20, 30 or 40 years. Yet the NWIW facility, if built, will continue to operate for 40 years, processing and shipping a potentially outdated and polluting product. If methane becomes the most polluting fuel for plastics processing, NWIW could be the facility other entities would be trying to replace. Yet we in Washington would be stuck with it and its significant GHG output.

Additionally, there's no way to reliably predict what some other country or facility might do now or decades into the future. Again, if China or any other country decides not to use methanol, or not to use NWIW methanol, the NWIW facility could continue to operate and continue to be responsible for significant GHG emissions. NWIW views its operation as a financial investment. It won't simply close its facility if other, more environmentally sound materials or processes exist.

The Department of Ecology should not base permit approval on a speculative assumption. The Department of Ecology should deny the NWIW permit.

Lou Ann Bennett

Dear Director Watson and Department of Ecology:

Don't allow the world's largest fracked gas-to-methanol refinery to harm our climate and Kalama! Washington should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama. NWIW misled your agency, and the public, about the purpose and impacts of the refinery. I am counting on Ecology to dismiss NWIW's misleading claims and accurately account for the project's upstream and downstream climate pollution.

The Ecology Strategic Plan for 2021-23 supports a NO on this decision. I'm trusting Washington State will continue to be a leader in our Region and Country making tough decisions to uphold the safety, integrity and harmony of our ecology for generations to come. I especially appreciate your mission and experience of protecting low-income and BIPOC residents who are at the highest risk by this project. I'm inspired by Violet and many other young people standing up for zero waste and a future environment in which they can thrive.

I counting on you to make the decision for the greatest of all good considering all beings for seven generations to come.

Sincerely, Lou Ann Bennett

Your Columbia River Neighbor

Dennis Colombo

Regarding the Northwest Innovation Works – Kalama Manufacturing and Marine Export Facility SSEIS, I am submitting the following comments:

The SSEIS states that "The project would increase greenhouse gas emissions within Washington state by almost one million metric tons of carbon dioxide equivalent a year." as well as indeterminate upstream emissions. And yet the claim is that this project will somehow result in a net global reduction in greenhouse gas emissions. I believe that the justifications for allowing this project to move forward seems flawed and highly speculative. Particularly the notion that the People's Republic of China can be relied upon to reduce their use of coal due to their importation of methanol from Kalama. Also, I believe that the uncertainty regarding the level of upstream greenhouse gas emissions makes it impossible to demonstrate how those emissions could be mitigated.

In conclusion, I see no demonstrative proof that the Kalama facility would reduce worldwide net greenhouse gas emissions and I believe that the risks to the environment and the health and wellbeing of local residents far outweigh any benefits. Therefore, I urge that this permit be denied.

Dr. Candace Gossen

I have lived in colorado the last 4 years in Medical School and with more than 50,000 wells surrounding the city its air and water quality is in sickening levels. I have even longer worked on environmental sustainability issues in seeing flammable water and the killing of species within polluted water systems. This eventually trickles down to human health. Be wise. Do not put this risk into the nature system that will stay around forever beyond our generation.

John Bowen

This project will contribute to the current climate disaster we are experiencing in the world today.
Stop this insanity.

Linda Buckley

Dear Mr. Doenges, I attended the informative presentation yesterday on the second EIS and public hearing. I am a 3 year resident of Vancouver Washington and very concerned about the environmental risks created by the proposed gas to methanol refinery at Kalama. Although new to the PNW, I am active in conservation groups to stay informed on various sides of environmental issues. When we moved to Vancouver WA the big issue was the proposed gas terminal at the Port of Vancouver WA; it was voted down by the majority. I believe Kalama is a similar situation. Demand for methanol is going down and the environmental risks to the regional population-both short and long term-are too great. I don't know that we can trust the proponent company to carry out the promised mitigation and create the number of jobs. Let's create jobs in the green energy sector! Please don't approve the Kalama refinery. Thanks for considering my comments. Linda Buckley, Vancouver WA resident

Jay Pine

There are several points that are very troubling about this project.

The first is that the owners of this proposed plant will take it upon themselves to mitigate future greenhouse gas emissions. The oil and gas industry has an extremely poor track record in that regard! Leaving this chore up to them is like asking the fox to guard the henhouse. Another point is that the methanol will be used to produce plastic manufacturing. The world is choking on plastic waste and the oil industry is using plastic manufacturing as the new frontier for oil profiteering.

As the demand for gas and oil dwindles the oil companies are finding new ways to keep us tied to their pipelines. Please do not allow this toxic facility to be constructed in Washington State , our future investments in energy infrastructure should involve wind,solar and renewable energy. Thank you,

Jay Pine

Linda Leonard

Make no mistake about it, Kalama, the state of Washington and the world does not need the proposed methanol refinery to be built.

Northwest Innovation Works' have used the rationale the facility would cause a net reduction in current greenhouse gas emission levels by forcing Chinese-to-coal methanol facilities off line.

Ecology's analysis state that current global greenhouse gas emissions would increase substantially if this project were built, but perhaps not as substantially as if, China's methanol demands were met by other sources.

The gas impact analysis summary reads: What would happen in the markets if KMMEF were not to go into operation? The analysis of methanol supply in China shows that there is existing capacity in China to increase methanol production and meet growing demand. This is expected to be supplied from coal-based methanol, the lowest-cost producer in China. Additional demand will be met with natural gas based imports which are also low cost. NWIW's facility is expected to be one of the lowest cost of these exporting producers.

But absent Kalama Manufacturing and Marine Export Facility, other low cost natural gas based exporters would also supply the growing market in China.

The summary concludes, there are always uncertainty in future markets with respect to prices, policies, the global pandemic recession and relationships between input suppliers and producers.

Rather than engage in this speculation, Ecology should focus on the real world, known pollution that will come from the facility rather than NWIW's dubious displacement argument.

The misguided conclusion that the world's largest fracked gas to methanol refinery would somehow benefit our climate and have no significant adverse impacts on the Columbia River estuary or the public is appalling.

I am calling on the Department of Ecology to reject this project and to deny the Shorelines permit from proceeding.

Karey Kessler

Dear WA Department of Ecology,

As a person of faith, I believe we are called to care for both the well-being of communities and the environment.

Inherent in this moral imperative is investing in a livable future that is safe for all to thrive.

Building the world's largest fracked gas-to-methanol plant in Washington does not align with my personal values of stewardship and justice, nor does it support our state's commitment to reducing climate pollution. Please reject Northwest Innovation Work's proposed methanol refinery in Kalama and deny its Shorelines Permit.

The second Supplemental Environmental Impact Statement for the Kalama methanol refinery clearly shows that this project is dirty, dangerous, and unwise. If built, our state will be locked into decades of additional climate pollution, even though we know it is past time to pursue a truly low-carbon future. Speculating that this project may displace other fossil fuels is not adequate justification for the known pollution that will harm our communities and climate.

Northwest Innovation Works has demonstrated that they are deceptive and will seek profit over people's wellbeing. They cannot be trusted to mitigate the impacts of this fracked gas refinery. The fact that the project has needed three reviews, with outspoken community opposition during each, shows that there is something wrong with it at its core. As Governor Inslee stated, we cannot support such fracked gas projects in good conscience.

You have a moral responsibility to protect public health and reduce our region's climate pollution. Please do what is right and deny this project. Thank you.

Sincerely,
Ms. Karey Kessler

To whom it may concern,

Please do not approve the permits to complete the Kalama Methanol Refinery. We are at an urgent time in history to create earth friendly resources and methanol is not the answer.

We are currently seeing the results of climate change as we watch the entire West coast burn from wildfires. These wildfires are affecting every human being around the world. It's time for us to invest in resources that prolong the human race. We need to look beyond monetary goals and look at sustainable energy.

According to the Scientific American article Study Revised Estimate of Methane Leaks from US fracking fields published In 2013 "significant leaks of heat-trapping methane from natural gas production sites would erase any climate advantage the fuel offers".

Furthermore according to an article posted in Environmental Science dated 7/12/14 entitled Arctic Methane Leaks, Facts, and Our Future we know that "methane is worse than dioxide-it is roughly 30 times more potent as a heat-trapped greenhouse gas."

More recently in September 2, 2020 "Ecology's DSSEIS finds 4.6 million metric tons CO₂e pollution added to our atmosphere every 40 years."

And in an July 20, 2020 published article in the New Atlas entitled Global Emissions of heat-trapping methane hit record high, "new analysis has revealed that emissions of this particular potent greenhouse gas has now hit record highs with the surge being driven in large part by the burning of fossil fuels and increased agricultural activity."

I've been reading for years of residents in the mid-West losing their fresh water. Watched videos of their water turning to fire when lit with a lighter. Losing valuable water for livestock. This is not something WA wants.

As a born, raised and returned WA resident, I beg of you to think about the long term affects this will have on our state; including, the salmon population in the Columbia River, the 12 million tons of carbon pollution to the atmosphere every year, an increase of our states total fracked fossil-gas use by 38%, the increase in WA started greenhouse gas emissions.

Say no to Methanol in Washington state. We do not need foreign entities to be building and/or taking of Washington's resources. Reject permits for the proposed Kalama Methanol refinery.

Thank you
Amber Martinell

Linda Tippens

Our state should not be used to benefit another county while polluting our environment. If China needs this chemical, let them build their own plant.

Our governor pretends to be for the environment but our sound is polluted by commercial cruise ships and our air from coal trains. Now this!? Please... Do not allow this plant to be built.

Carleen Wolgamott

Cowlitz County and Washington State can do better at creating new jobs than having a plant built which will be one of Washington State's top ten polluters and also a huge global contributor to plastics pollution. Please read the attached NPR article which I saved as NPR Plastic Pollution Little Recycling. The article's title is:"How Big Oil Misled The Public Into Believing Plastic Would Be Recycled.

Thank you, Carleen Wolgamott

How Big Oil Misled The Public Into Believing Plastic Would Be Recycled

Landfill workers bury all plastic except soda bottles and milk jugs at Rogue Disposal & Recycling in southern Oregon.

Laura Sullivan/NPR

Note: An audio version of this story aired on NPR's Planet Money. [Listen to the episode here.](#)

Laura Leebrick, a manager at Rogue Disposal & Recycling in southern Oregon, is standing on the end of its landfill watching an avalanche of plastic trash pour out of a semitrailer: containers, bags, packaging, strawberry containers, yogurt cups.

None of this plastic will be turned into new plastic things. All of it is buried.

"To me that felt like it was a betrayal of the public trust," she said. "I had been lying to people ... unwittingly."

Rogue, like most recycling companies, had been sending plastic trash to China, but when China shut its doors two years ago, Leebrick scoured the U.S. for buyers. She could find only someone who wanted white milk jugs. She sends the soda bottles to the state.

But when Leebrick tried to tell people the truth about burying all the other plastic, she says people didn't want to hear it.

"I remember the first meeting where I actually told a city council that it was costing more to recycle than it was to dispose of the same material as garbage," she says, "and it was like heresy had been spoken in the room: You're lying. This is gold. We take the time to clean it, take the labels off, separate it and put it here. It's gold. This is valuable."

But it's not valuable, and it never has been. And what's more, the makers of plastic — the nation's largest oil and gas companies — have known this all along, even as they spent millions of dollars telling the American public the opposite.

In Partnership

This story is part of a joint investigation with the PBS series *Frontline* that includes the documentary *Plastic Wars*, which aired March 31 on PBS. [Watch it online now.](#)

NPR and [PBS *Frontline*](#) spent months digging into internal industry documents and interviewing top former officials. We found that the industry sold the public on an idea it knew wouldn't work — that the majority of plastic could be, and would be, recycled — all while making billions of dollars selling the world new plastic.

The industry's awareness that recycling wouldn't keep plastic out of landfills and the environment dates to the program's earliest days, we found.

"There is serious doubt that [recycling plastic] can ever be made viable on an economic basis," one industry insider wrote in a 1974 speech.

Yet the industry spent millions telling people to recycle, because, as one former top industry insider

told NPR, selling recycling sold plastic, even if it wasn't true.

"If the public thinks that recycling is working, then they are not going to be as concerned about the environment," Larry Thomas, former president of the Society of the Plastics Industry, known today as the Plastics Industry Association and one of the industry's most powerful trade groups in Washington, D.C., told NPR.

In response, industry representative Steve Russell, until recently the vice president of plastics for the trade group the American Chemistry Council, said the industry has never intentionally misled the public about recycling and is committed to ensuring all plastic is recycled.

"The proof is the dramatic amount of investment that is happening right now," Russell said. "I do

understand the skepticism, because it hasn't happened in the past, but I think the pressure, the public commitments and, most important, the availability of technology is going to give us a different outcome."

Here's the basic problem: All used plastic can be turned into new things, but picking it up, sorting it out and melting it down is expensive. Plastic also degrades each time it is reused, meaning it can't be reused more than once or twice.

On the other hand, new plastic is cheap. It's made from oil and gas, and it's almost always less expensive and of better quality to just start fresh.

All of these problems have existed for decades, no matter what new recycling technology or expensive machinery has been developed. In all that time, less than **10 percent of plastic** has ever been recycled.

But the public has known little about these difficulties.

It could be because that's not what they were told.

Starting in the 1990s, the public saw an increasing number of commercials and messaging about recycling plastic.

"The bottle may look empty, yet it's anything but trash," says [one ad from 1990](#) showing a plastic bottle bouncing out of a garbage truck. "It's full of potential. ... We've pioneered the country's largest, most comprehensive plastic recycling program to help plastic fill valuable uses and roles."

These commercials carried a distinct message: Plastic is special, and the consumer should recycle it.

It may have sounded like an environmentalist's message, but the ads were paid for by the plastics industry, made up of companies like Exxon, Chevron, Dow, DuPont and their lobbying and trade organizations in Washington.

Industry companies spent tens of millions of dollars on these ads and ran them for years, promoting the benefits of a product that, for the most part, was buried, was burned or, in some cases, wound up in the ocean.

Documents show industry officials knew this reality about recycling plastic as far back as the 1970s.

Many of the industry's old documents are housed in libraries, such as the one on the grounds of the first DuPont family home in Delaware. Others are with universities, where former industry leaders sent

their records.

At Syracuse University, there are boxes of files from a former industry consultant. And inside one of them is a report written in April 1973 by scientists tasked with forecasting possible issues for top industry executives.

Recycling plastic, it told the executives, was unlikely to happen on a broad scale.

"There is no recovery from obsolete products," it says.

It says pointedly: Plastic degrades with each turnover.

"A degradation of resin properties and performance occurs during the initial fabrication, through aging, and in any reclamation process," the report told

executives.

Recycling plastic is "costly," it says, and sorting it, the report concludes, is "infeasible."

And there are more documents, echoing decades of this knowledge, including one analysis from a top official at the industry's most powerful trade group. "The costs of separating plastics ... are high," he tells colleagues, before noting that the cost of using oil to make plastic is so low that recycling plastic waste "can't yet be justified economically."

Larry Thomas, the former president of the Society of the Plastics Industry, worked side by side with top oil and plastics executives.

He's retired now, on the coast of Florida where he likes to bike, and feels conflicted about the time he

worked with the plastics industry.

"I did what the industry wanted me to do, that's for sure," he says. "But my personal views didn't always jibe with the views I had to take as part of my job."

Thomas took over back in the late 1980s, and back then, plastic was in a crisis. There was too much plastic trash. The public was getting upset.

Garten Services, a recycling facility in Oregon, where paper and metals still have markets but most plastic is thrown away. All plastic must first go through a recycling facility like this one, but only a fraction of the plastic produced actually winds up getting recycled.

Laura Sullivan/NPR

In one document from 1989, Thomas calls executives at Exxon, Chevron, Amoco, Dow, DuPont, Procter & Gamble and others to a private meeting at the Ritz-Carlton in Washington.

"The image of plastics is deteriorating at an

alarming rate," he wrote. "We are approaching a point of no return."

He told the executives they needed to act.

The "viability of the industry and the profitability of your company" are at stake.

Thomas remembers now.

"The feeling was the plastics industry was under fire — we got to do what it takes to take the heat off, because we want to continue to make plastic products," he says.

At this time, Thomas had a co-worker named Lew Freeman. He was a vice president of the lobbying group. He remembers many of the meetings like the one in Washington.

"The basic question on the table was, You guys as

our trade association in the plastics industry aren't doing enough — we need to do more," Freeman says. "I remember this is one of those exchanges that sticks with me 35 years later or however long it's been ... and it was what we need to do is ... advertise our way out of it. That was the idea thrown out."

So began the plastics industry's \$50 million-a-year ad campaign promoting the benefits of plastic.

"Presenting the possibilities of plastic!" one iconic ad blared, showing kids in bike helmets and plastic bags floating in the air.

"This advertising was motivated first and foremost by legislation and other initiatives that were being introduced in state legislatures and sometimes in Congress," Freeman says, "to ban or curb the use of plastics because of its performance in the waste

stream."

At the same time, the industry launched a number of feel-good projects, telling the public to recycle plastic. It funded sorting machines, recycling centers, nonprofits, even expensive benches outside grocery stores made out of plastic bags.

Few of these projects actually turned much plastic into new things.

NPR tracked down almost a dozen projects the industry publicized starting in 1989. All of them shuttered or failed by the mid-1990s. Mobil's Massachusetts recycling facility lasted three years, for example. Amoco's project to recycle plastic in New York schools lasted two. Dow and Huntsman's highly publicized plan to recycle plastic in national parks made it to seven out of 419 parks before the

companies cut funding.

None of them was able to get past the economics: Making new plastic out of oil is cheaper and easier than making it out of plastic trash.

Both Freeman and Thomas, the head of the lobbying group, say the executives all knew that.

"There was a lot of discussion about how difficult it was to recycle," Thomas remembers. "They knew that the infrastructure wasn't there to really have recycling amount to a whole lot."

Even as the ads played and the projects got underway, Thomas and Freeman say industry officials wanted to get recycling plastic into people's homes and outside on their curbs with blue bins.

The industry created a special group called the

Council for Solid Waste Solutions and brought a man from DuPont, Ron Liesemer, over to run it.

Liesemer's job was to at least try to make recycling work — because there was some hope, he said, however unlikely, that maybe if they could get recycling started, somehow the economics of it all would work itself out.

"I had no staff, but I had money," Liesemer says. "Millions of dollars."

Liesemer took those millions out to Minnesota and other places to start local plastic recycling programs.

But then he ran into the same problem all the industry documents found. Recycling plastic wasn't making economic sense: There were too many different kinds of plastic, hundreds of them, and

they can't be melted down together. They have to be sorted out.

"Yes, it can be done," Liesemer says, "but who's going to pay for it? Because it goes into too many applications, it goes into too many structures that just would not be practical to recycle."

Liesemer says he started as many programs as he could and hoped for the best.

"They were trying to keep their products on the shelves," Liesemer says. "That's what they were focused on. They weren't thinking what lesson should we learn for the next 20 years. No. Solve today's problem."

And Thomas, who led the trade group, says all of these efforts started to have an effect: The message

that plastic could be recycled was sinking in.

"I can only say that after a while, the atmosphere seemed to change," he says. "I don't know whether it was because people thought recycling had solved the problem or whether they were so in love with plastic products that they were willing to overlook the environmental concerns that were mounting up."

But as the industry pushed those public strategies to get past the crisis, officials were also quietly launching a broader plan.

In the early 1990s, at a small recycling facility near San Diego, a man named Coy Smith was one of the first to see the industry's new initiative.

Back then, Smith ran a recycling business. His customers were watching the ads and wanted to

recycle plastic. So Smith allowed people to put two plastic items in their bins: soda bottles and milk jugs. He lost money on them, he says, but the aluminum, paper and steel from his regular business helped offset the costs.

But then, one day, almost overnight, his customers started putting all kinds of plastic in their bins.

"The symbols start showing up on the containers," he explains.

Smith went out to the piles of plastic and started flipping over the containers. All of them were now stamped with the triangle of arrows — known as the international recycling symbol — with a number in the middle. He knew right away what was happening.

"All of a sudden, the consumer is looking at what's

on their soda bottle and they're looking at what's on their yogurt tub, and they say, 'Oh well, they both have a symbol. Oh well, I guess they both go in,' " he says.

Unwanted used plastic sits outside Garten Services, a recycling facility in Oregon.

Laura Sullivan/NPR

The bins were now full of trash he couldn't sell. He called colleagues at recycling facilities all across the country. They reported having the same problem.

Industry documents from this time show that just a couple of years earlier, starting in 1989, oil and plastics executives began a quiet campaign to lobby almost 40 states to mandate that the symbol appear on all plastic — even if there was no way to economically recycle it. Some environmentalists also supported the symbol, thinking it would help

separate plastic.

Smith said what it did was make all plastic look recyclable.

"The consumers were confused," Smith says. "It totally undermined our credibility, undermined what we knew was the truth in our community, not the truth from a lobbying group out of D.C."

But the lobbying group in D.C. knew the truth in Smith's community too. A report given to top officials at the Society of the Plastics Industry in 1993 told them about the problems.

"The code is being misused," it says bluntly.

"Companies are using it as a 'green' marketing tool."

The code is creating "unrealistic expectations"

about how much plastic can actually be recycled, it told them.

Smith and his colleagues launched a national protest, started a working group and fought the industry for years to get the symbol removed or changed. They lost.

"We don't have manpower to compete with this," Smith says. "We just don't. Even though we were all dedicated, it still was like, can we keep fighting a battle like this on and on and on from this massive industry that clearly has no end in sight of what they're able to do and willing to do to keep their image the image they want."

"It's pure manipulation of the consumer," he says.

In response, industry officials told NPR that the code was only ever meant to help recycling facilities

sort plastic and was not intended to create any confusion.

Without question, plastic has been critical to the country's success. It's cheap and durable, and it's a chemical marvel.

It's also hugely profitable. The oil industry makes more than **\$400 billion a year** making plastic, and as demand for oil for cars and trucks declines, the industry is telling shareholders that future profits will increasingly come from plastic.

And if there was a sign of this future, it's a brand-new chemical plant that rises from the flat skyline outside Sweeny, Texas. It's so new that it's still shiny, and inside the facility, the concrete is free from stains.

Chevron Phillips Chemical's new \$6 billion plastic manufacturing plant

rises from the skyline in Sweeny, Texas. Company officials say they see a bright future for their products as demand for plastic continues to rise.

Laura Sullivan/NPR

This plant is Chevron Phillips Chemical's \$6 billion investment in new plastic.

"We see a very bright future for our products," says Jim Becker, the vice president of sustainability for Chevron Phillips, inside a pristine new warehouse next to the plant.

"These are products the world needs and continues to need," he says. "We're very optimistic about future growth."

With that growth, though, comes ever more plastic trash. But Becker says Chevron Phillips has a plan: It will recycle 100% of the plastic it makes by 2040.

Becker seems earnest. He tells a story about vacationing with his wife and being devastated by

the plastic trash they saw. When asked how Chevron Phillips will recycle 100% of the plastic it makes, he doesn't hesitate.

"Recycling has to get more efficient, more economic," he says. "We've got to do a better job, collecting the waste, sorting it. That's going to be a huge effort."

Fix recycling is the industry's message too, says Steve Russell, the industry's recent spokesman.

"Fixing recycling is an imperative, and we've got to get it right," he says. "I understand there is doubt and cynicism. That's going to exist. But check back in. We're there."

Larry Thomas, Lew Freeman and Ron Liesemer, former industry executives, helped oil companies out of the first plastic crisis by getting people to

believe something the industry knew then wasn't true: That most plastic could be and would be recycled.

Russell says this time will be different.

"It didn't get recycled because the system wasn't up to par," he says. "We hadn't invested in the ability to sort it and there hadn't been market signals that companies were willing to buy it, and both of those things exist today."

But plastic today is harder to sort than ever: There are more kinds of plastic, it's cheaper to make plastic out of oil than plastic trash and there is exponentially more of it than 30 years ago.

And during those 30 years, oil and plastic companies made billions of dollars in profit as the

public consumed ever more quantities of plastic.

Russell doesn't dispute that.

"And during that time, our members have invested in developing the technologies that have brought us where we are today," he says. "We are going to be able to make all of our new plastic out of existing municipal solid waste in plastic."

Recently, an industry advocacy group funded by the nation's largest oil and plastic companies launched its most expensive effort yet to promote recycling and cleanup of plastic waste. There's even a [new ad](#).

New plastic bottles come off the line at a plastic manufacturing facility in Maryland. Plastic production is expected to triple by 2050.

Laura Sullivan/NPR

"We have the people that can change the world," it says to soaring music as people pick up plastic trash

and as bottles get sorted in a recycling center.

Freeman, the former industry official, recently watched the ad.

"Déjà vu all over again," he says as the ad finishes.

"This is the same kind of thinking that ran in the '90s. I don't think this kind of advertising is, is helpful at all."

Larry Thomas said the same.

"I don't think anything has changed," Thomas says.

"Sounds exactly the same."

These days as Thomas bikes down by the beach, he says he spends a lot of time thinking about the oceans and what will happen to them in 20 or 50 years, long after he is gone.

And as he thinks back to those years he spent in

conference rooms with top executives from oil and plastic companies, what occurs to him now is something he says maybe should have been obvious all along.

He says what he saw was an industry that didn't want recycling to work. Because if the job is to sell as much oil as you possibly can, any amount of recycled plastic is competition.

"You know, they were not interested in putting any real money or effort into recycling because they wanted to sell virgin material," Thomas says.

"Nobody that is producing a virgin product wants something to come along that is going to replace it. Produce more virgin material — that's their business."

And they are. Analysts now expect plastic

production to triple by 2050.

Cat Schuknecht contributed to this report.

george shipley

I would like to go on record as opposing the Chinese proposal to build a methane producing and shipping complex near Kalama. The Chinese have no intention of mitigating any violations of air quality or trucking overload to the freeway system. Please vote to quash any further consideration of this methane transfer station.

George Shipley

Ann Littlewood

Northwest Innovations says the purpose of this project is to create methanol to ship to China to make plastic. I believe this article from NPR about recycling plastic is relevant.
<https://www.opb.org/article/2020/09/11/how-big-oil-misled-the-public-into-believing-plastic-would-be-recycled/?clid=ec36f95c-48a8-4699-9246-5c7cf195ed81&rpcid=92307526&exid=19072>

Cass Martinez

I live in the county across the river from the proposed facility. If The Kalama facility is permitted, it will have the unfortunate effect of making a second or third Northwest Innovation Works facility, as already proposed, more likely on our Oregon side, at Port Westward. Please consider then that a positive decision may cause two to three times more pollution, two to three times more over-withdrawal of river water. Secondly, the contract(s) involved, between the country of China and the small US port district(s), are between two very unequal parties, and the future consequences of such inequality are not being discussed, or even visualized. Our counties, even our states, do not have the wherewithal to contest future NWIW misbehavior and have a chance of prevailing at law.

Blaine Ackley

To whom it may concern,

Please do not approve the permits to complete the Kalama Methanol Refinery. We are at an urgent time in history to create earth friendly resources and methanol is not the answer.

We are currently seeing the results of climate change as we watch the entire West coast burn from wildfires. These wildfires are affecting every human being around the world. It's time for us to invest in resources that prolong the human race. We need to look beyond monetary goals and look at sustainable energy.

According to the Scientific American article Study Revised Estimate of Methane Leaks from US fracking fields published In 2013 "significant leaks of heat-trapping methane from natural gas production sites would erase any climate advantage the fuel offers".

Furthermore according to an article posted in Environmental Science dated 7/12/14 entitled Arctic Methane Leaks, Facts, and Our Future we know that "methane is worse than dioxide-it is roughly 30 times more potent as a heat-trapped greenhouse gas."

More recently in September 2, 2020 "Ecology's DSSEIS finds 4.6 million metric tons CO₂e pollution added to our atmosphere every 40 years."

And in an July 20, 2020 published article in the New Atlas entitled Global Emissions of heat-trapping methane hit record high, "new analysis has revealed that emissions of this particular potent greenhouse gas has now hit record highs with the surge being driven in large part by the burning of fossil fuels and increased agricultural activity."

I've been reading for years of residents in the mid-West losing their fresh water. Watched videos of their water turning to fire when lit with a lighter. Losing valuable water for livestock. This is not something WA wants.

I beg of you to think about the long term affects this will have on our state; including, the salmon population in the Columbia River, the 12 million tons of carbon pollution to the atmosphere every year, an increase of our states total fracked fossil-gas use by 38%, the increase in WA started greenhouse gas emissions.

Say no to Methanol in Washington state. We do not need foreign entities to be building and/or taking of Washington's resources. Reject permits for the proposed Kalama Methanol refinery.

Thank you,
Blaine Ackley

Alexa Fay

The proposed NWIW methanol refinery would cause millions of tons of greenhouse gas pollution each year, for 40 years. Ecology should deny the Shorelines permit for the refinery. The SEIS relies on a flawed, speculative analysis to argue that methanol could "displace" dirtier energy. The SEIS speculates on how methanol may compare with future, unsure, alternate sources of pollution in overseas markets. The SEIS makes a false and erroneous comparison with potential future other sources of methanol or olefin production. Rather than engaging in this speculation, Ecology should focus on the real-world, known pollution that will come from the facility rather than NWIW's dubious "displacement" argument.

Amanda Doimas

I moved to the Pacific NW 20 years ago to get away from a state (AZ) that continues to engage in destructive mining practices and neglect its precious water sources. Please do not allow this to happen here. We have been enduring horrific wildfires without introducing extremely flammable materials near our forests and water. I worry for our rivers and our impending earthquake future. Portland, my home, is not just upriver it is also downriver on the tidal Willamette.

Mike Pence

Hi Community!

Have you seen the destruction of Life and utter loss of billions of dollars of tourism, quality of Life for future generations in the Gulf Of Mexico? Have you?!?!?!?

If not, check out our Cascadia in the near future.

Then make the correct decision!

Thanks a bunch!

Mike

Thomas Gordon

If the proposed Kalama Methanol Refinery is built, a storage tank rupture would release a huge amount of greenhouse gases.

The proposed Kalama Methanol refinery is scheduled to be built with faults and suspected faults nearby, subject to earthquakes.

"In 1978, a major geological fault line was discovered running through the Trojan site, (0.6 mile away from Kalama), creating the specter of an earthquake that could trigger a nuclear disaster." This is from the Oregon Encyclopedia. This fault was one of the major reasons the Trojan nuclear reactor was shut down and then torn down. However, spent nuclear fuel rods are still stored close by, a present danger in the event of an earthquake. The proposed methanol refinery with storage tanks, only 0.6 mile away, could rupture an earthquake also.

The proposed Kalama methanol refinery would be built on fill material that is rated as highly susceptible to liquefaction and thus suffer higher damage from an earthquake. The Kalama area has at least one fault as shown by a 1.8 magnitude earthquake on April 13, 2020, 0.2 km from Kalama. This earthquake was at a depth of 0 km. A strong surface earthquake can cause more damage than one at depth. While this was a relatively weak earthquake, a major fault could be here with the potential for a stronger, damaging earthquake in the future.

A major earthquake could rupture methanol storage tanks with faults relatively close to the surface where the plant would be built. The release of the stored methanol could be catastrophic, especially if ignited by a spark from downed power lines. A huge amount of pollution and green house gases would subsequently be released.

The proposed Kalama methanol refinery, if it exploded, would pose a grave risk to the town of Kalama and add to the pollution and CO2 for our planet. This refinery should not be built.

Rebecca Nimmons

We must move away from fossil fuels and move to green energy, for our very survival is at stake! Climate change is real and we must face it head on or go down in flames. Going down in flames doesn't sound like the best option.

Brenda McCool

Please, for the love of god no fracking in Kalama

Carol Olivier

This is a disastrous environmental project. Fracking is a horribly dirty polluting industry-horrible for the environment. 1. Increases earthquakes (reference Oklahoma) 2. Poisons underground water and wells (reference Pennsylvania) 3. Increases methane in the atmosphere that will exponentially hasten climate change (yes it is happening, do not deny-witness superstorms in this country as well as world, massive unprecedented fires) 4. Our first people's oppose due to all these reasons and 5. Our own puget sound and wildlife are dying-the last thing everything needs is increased shipping, increased risks of spills, noises to kill our orcas, acidification killing fish....there needs to be leadership in supporting existing new technologies distinct from the fossil fuel industry which is killing the earth and any chances of a future for younger generations.

Kathleen Laney

Please do not approve any permit for this facility. Methanol is toxic and dangerous. It takes only a small amount to blind and kill. The accidents-and there's always accidents because these facilities are run by human beings- would be horrific with the potential deaths of both people, animals, birds and wildlife. It is not enough to "trust" the plants' operators to "Mitigate". It cannot replace what it will potentially destroy. We do not need this plant, and the risk it poses is not worth the potential profit. In addition, the greenhouse gases that it puts into the atmosphere-some million tons-is unacceptable. It flies in the face of every credible study on climate change that I have ever read. We need to put less greenhouse gases in the atmosphere, not more. This is accepted science. Please consider what you are putting at risk. Please do not allow this facility to operate.

Thank you

Kathleen Laney

Carole Glickfeld

This is a danger and an insult to the people of Washington State. It has been clearly demonstrated that fracking causes earthquakes. US States that have had fracking and never experienced earthquakes are now getting them by the many dozens. Additionally the consequences of this project pose major health hazards to people who want to breathe clean air and drink clean water. THIS PROJECT SHOULD BE TOTALLY ABANDONED NOW.

Anonymous Anonymous

Don't allow the world's largest fracked gas-to-methanol refinery to harm our climate and Kalama!

Washington State should reject Northwest Innovation Works' (NWIW) proposal to build and operate the world's largest fracked gas-to-methanol refinery in Kalama, WA.

The project would use more fracked gas than all of Washington's power plants, combined. The company has sought to mislead regulators and the public about the purpose and impact of the refinery, falsely claiming that the project will displace "dirtier" forms of fossil fuels. We know that fracked gas is a potent greenhouse gas pollutant, and we are counting on Ecology to accurately account for the project's upstream emissions as well as the downstream pollution from the likely combustion of NWIW's methanol for fuel.

For the community of Kalama and for our climate, the risk is simply too big. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution. We are counting on you to stop this dirty and dangerous project.

Ken White

As a resident in Kalama, I have concerns over the true environmental impact of this plant. I see very little information on the increase ship and car traffic that would also come with this construction nor do I see it having a true long term benefit by producing product that will continue to polite the environment for years to come. The plant is bad enough, it's products are even worse.

Rose Rohrer

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jody Gibson

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Peter Wood

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Robert Gigliotti

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Lorraine Martinez

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

michael pyle

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. In times of an oil glut, decreased exploration and US the leading oil producer; why would we need

increased capacity to make a gasoline additive? We should be moving away from fossil fuels and toward more sustainable (solar, wind & continued hydro) infrastructure.

Berl Nussbaum

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Lori Whittaker

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution. It has never been more important to protect our environment.

Deborah Francis

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Eric Zinn

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Donna Hendrix

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Eileen Juric

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Jerid Anderson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Brian Baltin

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

john zey

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this projects impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washingtons climate goals.

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Gale Espinosa

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Elizabeth Mayer

Fay Payton

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

It is quite clear that the mitigation procedures are totally inadequate and vague. Too much is left open to being ignored. This project is harmful to the State of Washington and harmful to the world at large. Climate change is happening whether we think it is or not. Science is clear here.

This project will enhance and amplify the climate change already happening. It will cause far more harm overall than any good. It is not a safe project. This State has goals for a safer, more healthy future. This is not it.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Margaret Woll

Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Shawn Marsh

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Katherine Kozisek

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Mark Counts

Are we, the citizens of Cowlitz County to believe that the world's largest methanol plant is in any way a long term benefit to the environment?

Driven by the intrusive monetary agendas tied to those of a hostile foreign country, this proposed industry will only serve to drive yet another large nail into the coffin lid of Earth's steadily worsening ecosystem.

Our ancestors would exhibit shock and outrage, as this situation should for any rational thinking person, at the threat this enterprise represents to future generations. I am disheartened to be living in a world that values greed and ignorance over stewardship and wisdom.

Rod Tharp

Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Virginia Rice

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

To continue to utilize fracked gas reserves in this way will continue to negatively impact our climate, as evidenced by the number and destruction of wild fires this summer. It's far past time to focus our efforts in more sustainable directions. They are known and should be supported. not more of the same...

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Nancy Nelson

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Richard Curtis

Washington State and the northwest part of our nation are known for clean air and water. Lately our air quality has been destroyed by smoke from fires that are the result of record temperatures and drought. As our climate continues to change we must not add pollution from a gas to methanol refinery to also foul the clean air essential to our survival.

Thank you for your work to protect Washingtons environment and recognition that the previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama are inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIWs proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIWs emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this projects impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIWs proposed facility would become one of the greatest sources of climate pollution in Washington. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Christopher Murphy

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Keith Cowan

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Elizabeth Grant

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Francesca Ritson

The Kalama methanol producing plant is a bad idea for a vulnerable site to environmental pollution. The premise, that it should be considered to do less environmental harm as the plant will be built somewhere else, is specious and just wrong. There are no good reasons to allow this plant to be built, - only bad reasons:., encouraging fracking, encouraging pollution and health risks, potential for fouling the Columbia, producing a product to produce an environmental pollutant and hazard.

Washington is starting to be a leader on climate change mitigation, this plant would definitely be a step in the wrong direction.

Joan Bowers

It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Eileen Schepers

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Dawn Aiken

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Thank you for your work to protect Washingtons environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

We need to move away from fossil fuels. This plant will only add pollution and is not necessary. Please do not approve this plant.

Russell Maier

As a physician, I oppose this plant for three reasons:

1) Climate change has a direct effect on the health of the public, and this plant, along with the transportation of its raw materials and product will produce greenhouse gas emissions for the next 40 years. This is inconsistent with the state's efforts to reduce greenhouse gases.

2) The future is not more carbon based fuel. As our state demonstrates, solar, wind, and hydropower can provide the power needed for the future. The SEIS argument relies on a future that reflects the past. Given that renewables are rapidly replacing carbon based fuels it is speculative, not fact based, to argue that one fossil based fuel would 'displace' other fossil based fuels.

3) We live in the same world. Even if methanol fuel is exported, those carbon emissions will contribute to global warming. Do we want to be the state where we export our products to damage others? I think not.

Gordon Wheat

Kalama Manufacturing and Marine Export Facility Second Supplemental EIS

As a longtime resident of Washington, as a physician with a public health background and as a citizen of the world, I need to add my comments on the proposed Kalama Manufacturing and Marine Export Facility.

As a member of the Washington Academy of Family Physicians Public Health Committee, I am very concerned about the air and water discharges that would result from this refinery. The Columbia River Aquifer is very sensitive and could be irreparably damaged.

The proposed methanol refinery would lead to millions of tons of greenhouse gas pollution each year, and once built it could not be shut down for the life of the refinery, some 30-40 years.

Ecology's own analysis shows that the project would produce 4.6 million tons of carbon pollution each year, or more. This level of pollution is profoundly inconsistent with achieving Washington's climate goals, protecting Washington's Shorelines, and charting a path to keep global temperature rise below 2 degrees C.

In 2018 and 2019, NWIW informed potential investors that methanol from the planned refinery could be burned as fuel overseas, in sharp contrast to claims NWIW made to local and state regulators that the methanol would only be used to manufacture plastic. Now, Ecology's analysis contemplates 40 percent of the methanol being burned, yielding 2 million tons of carbon pollution each year.

Washington State needs to take a stand and not make a commitment to the fossil fuel industry to allow the industry to use our land and our shoreline to ship methanol overseas under long term contracts.

The risk to our environment in Washington from potential leaks and discharge from the plant damaging our fragile Columbia River Shoreline is not acceptable. Ecology should deny the Shorelines permit for the refinery.

Why should Washington State take the risks to our environment and the health of our population for a small number of jobs, only to provide fuel for pollution in China and elsewhere. The voters of the state of Washington should say that we are not going to sacrifice our health and our environment to further the destruction of our planet. We are seeing the early effects of climate change now, and the effects will be exponentially worse in 10-20 years, but the plant once built will be irreversible.

Please let the voices of reason from the citizens of this state be heard before finalizing the Second Supplemental EIS.

Sincerely,

Gordon Wheat MD

WAFP Public Health Committee

Washington State Department of Health One Health Taskforce and Workgroup

Laura Finkelstein

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Katherine Wright

The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

John MD

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Lauri Lindquist

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Barbara Fristoe

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Diane Sullivan

The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Patricia Freeman

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Linda Dodson

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

Kirk Leonard

The Kalama methanol refinery would be one of the top polluters in Washington State. The SSEIS analysis estimates the Kalama Manufacturing and Marine Export facility would produce 4.6 million tons of carbon pollution each year. This level of pollution is inconsistent with achieving Washington State's climate goals.

We the people in this state depend on these resources, not to be used for producing plastics or fuel for China.

I oppose this project, please deny the permit.

Jim Haley

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

Janalee Roy

I already fear that my two children--both in their mid-thirties--will not live to see their natural deaths, as they will die from the effects of climate change much sooner than their "4 score and 10." Even I--a 69-year-old woman--will likely die from fires, flooding, unbreathable air, undrinkable water, or further climate-change-caused pandemics rather than from natural causes. ANY further polluting projects are NOT necessary and need to be canceled and replaced with clean energy projects. Get out of the dark ages!!!

Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Even with all of its flaws, this analysis confirms that NWIW's proposed facility would become one of the greatest sources of climate pollution in Washington. It is simply unacceptable for Washington to build an unequivocally and enormously polluting facility based on speculative analysis and a faint hope of theoretical emission reductions. Ecology should dismiss the speculative basis that this project could displace even more polluting facilities, and instead should base its permitting decision on what is reasonably foreseeable and indeed, assured, about this project--that it would cause millions of tons of greenhouse gas pollution each year, for 40 years, and is profoundly inconsistent with achieving Washington's climate goals.

The evidence in this draft SEIS demonstrates that Washington should deny NWIW's proposal to build and operate this dangerous methanol refinery in Kalama. We cannot keep building fossil fuel export infrastructure and expect to address the dangers of climate change.

Please keep our communities safe and keep Washington on track to meet our goals for reducing climate pollution.

MaryJo Wilkins

Thank you for your work to protect Washington's environment and acknowledgement that previous environmental analysis of Northwest Innovation Works (NWIW) Methanol refinery proposal in Kalama, Washington have been inaccurate and inadequate.

This new Draft Supplemental Environmental Impact Statement represents some important improvements in evaluating the true climate impacts of this facility, including addressing the likelihood that methanol produced by this facility will be used as transportation fuel, despite deliberate efforts by NWIW to mislead your agency and the public otherwise. And while the SEIS has made some necessary adjustments in the methane leakage rates, the rates continue to be low estimates given the widespread underreporting of leaks. However, even with the unreasonable assumptions about the single-sourcing of gas from British Columbia, as well as the unrealistically low leakage estimates for that source, the analysis confirms that NWIW's proposed facility would be enormously polluting.

Despite these marginal improvements, the evaluation of potential mitigation and displacement contained in this analysis is misleading and concerning in its reliance on speculative and unenforceable assumptions. One can simply look to the impacts of this pandemic to see evidence of incredible uncertainty and volatility in energy market dynamics. It is dangerous to presume this analysis can accurately predict global fuel markets, technology developments, consumer behavior, or regulations for the coming four decades. Furthermore, the SEIS provides too little detail on the actual mitigation that would be accomplished within the voluntary mitigation framework, nor does this mitigation address the full impacts of NWIW's emissions that will occur overseas. The mitigation framework is too vague for Ecology to conclude that this project's impacts will be mitigated, and the urgency of climate change demands that mitigation should be the last option (after all other impacts are reduced) in order to address unavoidable impacts, not simply to maintain the status quo as we continue to build out the fossil fuel industry.

Carol Boudreau

I live on the Columbia River downstream from Kalama and believe that what happens there will not stay there. I am writing to ask you To DENY the shoreline conditional use permit for NW Innovation Works gas to methanol plant and reject the refinery. Washington does not need another major polluter. The idea that it will actually reduce carbon emissions on a world-wide scale is absurd. Once the methanol leaves Kalama, there really is no way that Washington can control the pollution caused anywhere else by its production, storage, transport and final use. According to Riverkeeper, "NWIW identifies no specific projects or measures that will address the enormous greenhouse gas pollution impact of the proposed refinery." The Dept. of Ecology did not require NWIW to disclose their specific plans for pollution mitigation and thus should not approve this project.

Valerie Mehring

Daniela Birch

I oppose the construction of the Kalama Manufacturing and Marine Export Facility. The consensus on the world's scientists is that stabilization of the earth's climate requires reduction of greenhouse gas emission to net zero in less than a decade. All members of the global community must take unprecedented action to limit global greenhouse gas emissions beginning immediately. Building a new mega facility that will contribute enormous amounts of greenhouse gases to the atmosphere will further destabilize our climate.

Abigail Houghton
